The British Expeditionary Force (four divisions and a cavalry division) was about to land in France, but it was not comprised in "Plan 17." A secret appendix to the plan, known to a few, provided for a hypothetical "Army W." landing from overseas and proceeding to the region of Valenciennes and Maubeuge, but the way in which this army (should it materialize) might best be employed could not be seen until the rôle of the French V. Army had become clearer. Meantime, it was to double the part of left echelon which was assigned to the French reserve formations about Vervins.

But meantime, the troop-trains were arriving in the concentration areas, and the broad "Plan 17" had to be replaced by an operation order "No. 1." On the morning of Aug. 8, therefore, General Joffre, general-in-chief of the "Armies of the North-East," issued his specific instructions.

The French Offensive.—The enemy, it seemed, had grouped his main forces in the region of Metz, in front of Thionville (Diedenhofen), and in Luxemburg, with some 12 divisions in Lorraine and Alsace and an undetermined force which included parts of 10 divisions in the Liége and Ardennes regions. This main force (Metz–Luxemburg) seemed to be pointing westward, but might equally well swing southward, pivoting on its fortifications. The French armies were, consequently, to take the offensive—which was to be as *foudroyante* as possible—and with all forces in combination to seek to bring the enemy to decisive battle, resting their right flank on the Rhine. In order to ensure simultaneity and unison in the battle effort, it was laid down that the left wing armies might have to hold back, so as not to become involved in battle with German masses traversing the southern Ardennes or northern Woëvre, or both, before the right wing had advanced and made effective contact with its opponents.

The *I. Army* (Gen. Dubail), composed as in "Plan 17," was, instead of merely coöperating with and flankguarding the II. (as in the plan), to become the main offensive element in Lorraine and Alsace. Its VII. Corps, with a cavalry division, was to break into upper Alsace at once from Belfort, to drive back all forces it met, and, progressively reinforced by the three reserve divisions from Vesoul, to gain ground towards the fortified barrier Strassburg–Molsheim, destroying bridges and blocking-up bridgeheads on the Rhine as it advanced. The main body of the army, with a frankly E.N.E. direction, was to push towards the front Fenestrange (Finstingen)–Saarburg–the Donon, and to drive back its opponents on Strassburg and into lower Alsace.

The *II. Army* (Gen. de Castelnau), composed as in the plan, was now to play the part of auxiliary to the I. Its first objective was to be the front Delme–Salins–Dieuze, and its axis Château Salins–Saarbrücken. It was to flankguard towards Metz, and, moreover, to leave two of its five corps in the region of Toul at General Joffre's disposal.

The *III. Army* (Gen. Ruffey), constituted as in the plan, was disposed in the Woëvre facing Metz, and was to be ready either to counter-attack any German forces emerging from the Metz region or to take the offensive northward, with its left on Damvillers, according to the situation. The two corps taken from Castelnau would probably be employed in concert with this army, either in repelling a counter-offensive from Metz or in a northward movement.

The rôles to be given to the *IV.* and *V. Armies* were now defined more precisely. The IV. (Gen. de Langle de Cary) was to group itself between Argonne and Meuse, and the V. Army (Gen. Lanrezac) to condense between Vouziers and Aubenton, ready either (*a*) to attack any German army which traversed the Meuse between Mézières and the line Damvillers–Montfaucon or (*b*) to cross the Meuse themselves for the Ardennes–Arlon offensive. The II. Corps, hitherto the left wing of the protective system and attached to the V. Army, was now added to the IV. Army and directed to hold firmly to the northern outliers of Verdun and the left flank of Ruffey's army. Beyond the flank of Lanrezac was the group of reserve divisions about Vervins; the cavalry corps operating E. of Mézières and Montmédy was expected, if and when forced back over the Meuse, to take positions about Marienburg and Chimay. The rôle of "Army W." was as yet quite unsettled, as also was that of the Belgians.

Such was the order which initiated the "Battle of the Frontiers," the opening of the World War on the western front. The intentions may be, and have been, criticized, but they are clear. The general offensive of the French right wing, fixed for the 12th day of mobilization (Aug. 14), was directed N.E. and E.N.E. into the Rhine lands behind Strassburg and Molsheim, with a subsidiary effort in Alsace which would make good a front facing Molsheim–Strassburg–Neu Breisach and the upper Rhine fortifications, and, in case of success bringing the I. Army to behind Strassburg, besiege that fortress. The general offensive of the left was to be timed to coincide with the decisive phase of the operations of the right, but placed according to the progress of the main enemy armies which were presumed to have their right flank not farther N. than Mézières and their left flank on or in the fortified region Metz–Thionville.

But the possibility of arranging for the whole system to take its time from Dubail was made doubtful by a geographical factor—the Meuse. Had the areas in which the IV. and V. Armies were to act formed a single region, it would have been different, but the critical question was how to get these two armies over the Meuse at the exact moment determined by events in Lorraine, which might also be the very moment at which the German masses from Luxemburg themselves arrived on the river. It was this disturbing factor, quite as much as any events to the N. of Mézières, which governed the development of the French scheme. The details of this development, so far as concerns the left wing, are extremely complex and must be studied in the documents reproduced in F. Engerand's *Briey*, Joffre's *Préparation de la guerre et conduite des opérations*, Lanrezac's *Le plan de campaigne français*, and the anonymous *Le Plan XVII.* (publ. Payot). Here only a summary can be given.

By Aug. 13, the eve of the day fixed originally for the general offensive, the order of Aug. 8 had ceased to apply integrally to the left wing. While Dubail and Castelnau were to advance on the front Donon–Saarburg–Saarbrücken, as previously indicated, and a new and stronger army of Alsace under Gen. Pau was to carry out that part of the scheme which the VII. Corps had just attempted with disastrous results (*see* FRONTIERS, BATTLES OF THE: section *Alsace*), Ruffey, de Langle de Cary and Lanrezac were directed according to a new scheme which was independent in time as well as place of operations in Lorraine. It was now clear that the German northern group was stronger than had been supposed, but the evidence of its intention to cross the Meuse above Liége and sweep round through the Belgian plain seemed less convincing than the probability of its descending southward, and the French Command, after much interchange of views with Lanrezac, decided to push part of the V. Army northward into the region W. of Givet as a defensive precaution, and with the remainder and the IV. and III. Armies to carry out a series of preparations which would suit either of two hypotheses. If the Germans moving westward through the Ardennes were well advanced, they were to be struck by an offensive against the front, flank and rear, as soon as they were thoroughly involved in the crossing of the Meuse; if, as now seemed more probable, they were grouped with greater density in the northern and northeastern parts of the Ardennes, there would still be time for the V. and IV. Armies to advance before battle, not only over the Meuse, but also over the Lemoy and the lower Chiers. In that event the III. Army, which, with various mobile forces belonging to Toul and Verdun and the corps of the II. Army reserved to the general-in-chief by the order of Aug. 8, could assemble a considerable force, was to divide into a defensive group facing Metz and an offensive group which would aim northward, conforming to the right of the IV. Army, which would make good the lower Chiers; while the V. Army, holding defensively on the Meuse at Givet, was to reach the front Beauraing–Gedinne–Paliseul–Cugnon.

On Aug. 14, the offensive in Lorraine opened. Its progress was slow, but not marked by any untoward incidents up to Aug. 19. It was independent of events to the left of the Moselle except in so far as sorties might emerge from the S. and S.E. fronts of Metz, against which contingency the defensive group of the III. Army, the two reserved corps near Toul, and the echeloned left wing of the II. Army, were an adequate safeguard. On the other wing, however, obscurity still prevailed. Though Lanrezac was becoming more and more uneasy as to his left flank, and the Belgians, standing on the Geete line, called for support, nothing positive as to the German dispositions revealed itself, but on the evening of the 15th the veil was, partly at least, torn away. The part of Lanrezac's army which was stationed in the angle of the Sambre and Meuse became engaged with a large force of the enemy at Dinant. This consisted in reality only of cavalry and light infantry, but was estimated by the French commander, Franchet d'Espérey, as an army corps at least. At the same time, information came in tending to show that the Germans in the Ardennes included sixteen divisions. Moreover, the impression was formed both by Franchet d'Espérey opposing them and by the French cavalry commander skirting their southern flank, that the Dinant Germans were flankguarding a much more considerable force engaged in passing the Meuse below Namur; and Lanrezac energetically insisted on the fact that such large enemy forces could not conceivably be intended to operate entirely on the right bank of the Meuse. A remarkable absence of troops, at the same time, was reported by the French aviators reconnoitring the Arlon region. Thereupon Joffre formed a new plan. The V. Army, except one corps (already attached to the IV.), and its two reserve divisions, reinforced by one of the reserve corps on the Moselle and by forces from Algeria, newly arrived, was to join the forces already in the angle of the Sambre and Meuse, and to coöperate with the Belgians and the British—both of which armies now for the first time figured in the scheme of operations—in attacking the front and outer flank of the German "northern" forces, while the IV. Army was to prepare to debouch from the front Sedan–Montmédy in the direction of Neufchâteau against the "southern" enemy group (formerly presumed to be the "main" one) advancing from Luxemburg on the front Sedan–Damvillers; and the offensive portion of the III. by Étain and Jametz, was to be ready to march on Longwy, to break into the rear of this force. But this manœuvre was merely sketched out by preparations, and next day the veil descended again. The supposed movement of German masses over the Belgian Meuse was unconfirmed, and indeed denied; and without for the moment devoting more attention to the details of the coöperation to be obtained between the three distinct and independent commands W. of the Meuse (especially as Sir John French indicated Aug. 21 as the earliest date at which the British could come into action), Joffre's headquarters merely sent the cavalry corps withdrawn from the Ardennes to get into touch with the right of the Belgian positions on the Geete and—as a precaution against minor inroads through the Belgian plain into the industrial region of Lille—began the transfer to Arras of some ill-equipped territorial divisions, which, under General D'Amade, had hitherto watched the Italian frontier. It was to the proposed offensive of the IV. and especially of the II. Army that Joffre devoted his principal attention. For, on the estimate which had been formed of the German strength—which, however, was radically incorrect because it ignored the presence of reserve corps in immediate proximity to active corps—it seemed to certain of the directing brains at Vitry-le-François that the more forces the Germans placed west of the Belgian Meuse the slighter would be the resistance to be expected about Neufchâteau and Longwy and the better the chances of cutting the enemy in two by the offensive directed on these points.

From day to day the situation developed without becoming quite clear (for the Germans veiled their dispositions with the utmost success), and Joffre held stubbornly to the conception of his Neufchâteau–Longwy offensive. Lanrezac's anxieties and those of the Belgians increased, but they served only to confirm the impression that the drive into the Ardennes would, if properly timed and directed, reap a great harvest; and the declaration of Sir John French that he would not be able to begin operations till Aug. 23, instead of Aug. 21, caused the scheme of a combined operation N. of the Sambre to recede still farther into the background. On Aug. 20, Joffre, estimating that all the German forces destined for the Meuse had by that time passed out of the region Audun-le-Roman, Arlon, Luxemburg, gave the orders which launched the IV. Army into the Ardennes and the III. on Virton and Longwy.

The period of *nuances* was at an end. On that very day, on the one flank, Dubail's and Castelnau's offensive, which had penetrated to Morhange, Saarburg and the Donon, met defeat (*see* FRONTIERS, BATTLES OF THE: section *Lorraine*). Castelnau drew back hastily towards Nancy–Lunéville; Dubail, in spite of the exposure of his long right flank in the Vosges (which Pau's methodical advance from Belfort had done little to shorten), took down his left more steadily; but almost in a moment both were back in their concentration areas, followed by the eager enemy. On the other flank, the German masses facing the Belgian army front, hitherto screened by their cavalry, had at last declared themselves on Aug. 18, and the Belgian army, threatened with separation from Antwerp, yet most unwilling to give up the expectation of British or French support on its S. flank, was falling back from one position to another. Its decision to close up northward and fall out of the main operations was, it must be recognized, put off to the last possible moment, but the disconnectedness of the Allied movements left no alternative. For at that date Sir John French was not ready; and in the angle of Sambre and Meuse, Lanrezac, a prey to new and not ill-founded anxieties regarding his liaison with de Langle de Cary, was, with Joffre's approval, standing fast till Aug. 23, the date British coöperation should arrive.

In spite of the anxieties and disappointments caused by these events, Joffre held firmly to his intention. On the morning of Aug. 21 the executive order for which the IV. and III. Armies were waiting was sent. For the situation was now clear, and the plan of breaking through between the German manœuvre-masses and their fixed pivot, which in one form or another had been consistently followed in the period of obscurity, seemed destined now to have its reward. But there was one fundamental miscalculation. The old error which had led the professional soldiers of Napoleon III.'s day to regard the Prussian citizen-army as a "sort of militia," had reappeared in the form of a contempt for "reserve" formations. It was a mere matter of calculation that Germany's resources permitted her to create such formations; but that they should figure in the *masse de choc* was regarded as incredible. Yet it was true; and thus, instead of meeting a battle-army of 42 to 50 divisions with an array of 73 French, 6 Belgian and 4 British, as anticipated, the Allies encountered in reality one of 77 divisions, *i.e.* an equivalent instead of a much inferior force. This was especially important as bearing on the prospects of success in the Neufchâteau and Arlon directions. Strength was encountered where weakness was expected, and the relatively small numerical superiority of the attack did not suffice.

The story of the battles of Longwy and the Ardennes, of Charleroi, and Mons, will be found in detail in the article FRONTIERS, BATTLES OF THE. Here it must suffice to say that the French offensive into the Ardennes and towards Virton–Longwy–Audun-le-Roman met with general failure, and in some places with disaster; that the German II. and I. Armies, swinging on Huy as a pivot, swept down upon the French V. Army at Charleroi and the British Expeditionary Force at Mons, and bore them back; and that on Aug. 25 at 22:00 hours (10 P.M.) Joffre's orders were issued for a general retreat. The German plan of campaign had prevailed, and the German Command had the initiative in its hands.

At this point, then, the story of the operations is most conveniently told from the point of view of that side which dictated their course.

The German Plan of Campaign.—For the Germans, a war against France was essentially part of a two-front war. The resources of the country not being equal to simultaneous offensives against France and Russia, the choice had to be made between (*a*) standing on the defensive against France while seeking a decision in battle in the East, (*b*) waging a defensive war on both fronts, and (*c*) striving to crush France while standing on the defensive in the East. Of these (*b*) was held to be excluded by the presumed impossibility, for an industrial state, of enduring a long war, as well as by obvious military objections; (*a*) was never completely excluded, and had until some ten years before the war been the fundamental war-plan of the German General Staff; while (*c*) had in those last years obtained general acceptance, owing to the difficulty, for Germany, of waiting till the slow-moving Russians could be brought to action and defeated in a battle of the first magnitude. Whether, in view of the increased strength of the defensive on the one hand and the increased war-readiness of Russia on the other, the adoption, once more, of alternative (*a*) was not the best policy for Germany in the circumstances of 1914, is an open question; but, in fact, (*c*) was maintained and carried into effect.

But this increased readiness of Russia made it imperative for the Germans to protect East Prussia by a force at least sufficient to offer a step-by-step defence of that province and also, with their main armies reduced to that extent, to obtain a decision of the war in the West at the earliest possible moment, so as to release the greater part of the forces which had gained it for service in the East. The proportioning of means to the two theatres, therefore, was a very difficult problem, admitting of many *a priori* solutions, which might bring either victory or ruin.

The solution that found most adherents was that of Count von Schlieffen, chief-of-staff of the German army, in the first years of the present century. On assuming office, he had both restudied the draft plans of campaign and the tactical doctrines in vogue, and he had come to these conclusions: (*a*) that an offensive of maximum power, carried so far as to put France out of action definitively, was the only way to secure freedom of action in the East; (*b*) that this offensive, to secure the result aimed at—nothing less would suffice—must be developed on so broad a front as to grip and out-wing the most northerly and the most westerly points of France's defensive dispositions; (*c*) that a maximum density must be sought for on the right wing, even at the cost of exposing Lorraine and the Rhine lands to invasion.

The first of these considerations led to the acceptance—contrary to all the traditions of the German army—of the principle that not only active, but reserve, Ersatz and every other category of soldier must be effectively used. Schlieffen even proposed an intimate mixture, practically an amalgamation, of active and other elements, and aimed at putting into the field—in case of a *single-front* war, it is true—no less than 114 divisions against France. The second consideration led to the idea of a swing through Belgium and northern France far wider than that which was actually carried out. The route of the outer flank, which in spite of its extension beyond all probable French defences was to have a defensive echelon following on, was to touch Dunkirk, Abbeville, Rouen and pass round by Chartres, far to the W. of Paris—which would be invested automatically—so as to march in upon Auxerre and Troyes from the east. The line Ghent–Maubeuge–Thionville was to be reached on the 22d and the line Amiens–Rethel–Thionville on the 31st day of mobilization; that is, not hurry but certainty and power were to be the executive rules.

The third consideration, however, led to an even more remarkable result than the second. Of the 114 divisions no fewer than 101 were to operate N. and W. of the Thionville pivot, Lorraine, Alsace and the Rhine lands being committed to 13, of which two were allocated to the fortresses. The *leitmotiv* of extreme density on the right occurs in all Schlieffen's drafts and schemes. "Macht mir nur den rechten Flügel stark" were his half-conscious dying words. In a second scheme, based on the *two-front* war, which provided for a defence force in East Prussia approximately equal to that which von Moltke actually placed there in 1914, the total force was lessened to that extent, but the ratio of about seven divisions N.W. of Thionville to one S.E. of that pivot was maintained.

When von Moltke, the younger, succeeded Schlieffen, the above plans were gradually blunted, first because the idea of making the active army a simple kernel for soldiers of all categories was accepted only in part, and secondly because the growing war-readiness of the French army, the fever of offensive spirit that had obviously seized it, and after 1913 its very high peace-strength, made it increasingly likely that the French would open the war with a determined offensive into Lorraine and the Rhine lands. In these circumstances so drastic a depletion of the forces to the left of Metz as that contemplated by Schlieffen did not commend itself to Moltke, who found a compromise in allocating one-quarter of the whole available force, instead of one-eighth, to the defensive (or defensive-offensive) front, and holding large quantities of empty rolling-stock on the Rhine in readiness to transfer a proportion of this quarter to the right wing as soon as circumstances should allow this to be done. The amplitude of the swing was, however, undeniably diminished thereby.

In one point, Schlieffen and Moltke were agreed—the necessity of pushing out beyond the line of the Belgian Meuse. In both schemes therefore the quick seizure of Liége and a deployment foreground beyond that fortress figured as an indispensable preliminary to the operations proper.

The German plan, to which effect was given in August 1914, provided as follows: (*a*) A protective system was formed all along the line, consisting, not as had been expected of complete formations, but of single brigades of infantry (with a proportion of other arms), brought up from their peace stations without waiting to receive and equip their reservists. These brigades took over from the local troops the positions of the line that their respective army corps were to occupy, and their reservists rejoined by parties. (*b*) There was a concentration of the remainder of each corps, after mobilization in the usual way, behind its own representatives in the protective system. This concentration of the active corps was completed by the 14th day of mobilization (Aug. 15). (*c*) Concentration of reserve corps, as a rule immediately behind or to a flank of the corresponding active corps, was completed by the 16th day (Aug. 17). (*d*) Concentration of other formations, Ersatz divisions and mixed Landwehr brigades, was completed from the 11th to the 17th day. (*e*) The six advanced, peace-strength brigades of the corps intended to assemble about Aachen were employed as a striking force under General von Emmich, which without waiting for siege artillery was to attempt to storm Liége at once, if the Belgians did not agree to let the Germans pass. The German ultimatum to Belgium was handed in late on the evening of Aug. 2 (1st day of mobilization), and required an answer within twelve hours. There is reason to believe that, on Belgium's refusal, a proposal was made to Holland to allow the use of the Maestricht tongue as a gateway into the Belgian plain, but, whether this be so or not, it was only on the evening of the 3rd day of mobilization that the striking force crossed the frontier.

The order of battle, and allocation of the German forces N. of the pivot, was as follows: I. Army (General-Oberst von Kluck), five corps, assembled behind the Maestricht tongue (Jülich–Krefeld area); II. Army (General-Oberst von Bülow), seven corps, including one attached from I. Army, assembled facing the Liége frontier (Aachen–Malmédy–Euskirchen); III. Army (General-Oberst von Hausen), four corps, assembled in the area St. Vith–Wittlich–Bittburg; IV. Army (Duke Albrecht of Württemberg), five corps, assembled in the area Luxemburg (seized Aug. 2)–Trier–Diekirch–Wadern; V. Army (Wilhelm, German Crown Prince), five corps, assembled in the area Metz–Thionville–Saarbrücken.

Thus twenty-six active and reserve corps (52 divisions)—with a number of Landwehr brigades to follow—were allocated to the five armies of the moving wing, of which nearly half were to cross the Meuse between Namur and the Dutch frontier as soon as the way was clear. The remainder were to traverse the Ardennes from E. to W. in echelon from the right (III. Army) and to prepare to wheel gradually S.W. in proportion to the progress of the I. and II. Armies on the other side of the Meuse.

The 2nd Cavalry Command was of three divisions in front of the I. and II. Armies; the 1st Cavalry Command of three divisions in front of the III.; the 4th Cavalry Command of two divisions in front of the IV. They were individually responsible to the Supreme Command, except when from time to time placed at the disposal of certain armies. Similarly, the armies were in principle directly subordinate to the Kaiser's headquarters, *i.e.* to General-Oberst von Moltke, Chief of the General Staff, unless temporarily paired, as was the case at the outset, with the I. and II. Armies, of which Bülow was in general charge.

The organization of the forces E. and S.E. of Metz was somewhat different. Rupprecht, Crown Prince of Bavaria, was appointed not only Chief of the VI. Army, but "Commander-in-Chief in the Rhine lands," a title with wider implications than that of an army commander, and his task included the protection of the left flank of "the Army" or "the main forces." He had under him his own VI. Army (five corps, of which four were Bavarian), the VII. Army of General-Oberst von Heeringen (three corps) and the 3rd Cavalry Command (three divisions), in addition to the war garrisons of Metz, Strassburg, and the upper Rhine defences (Neu Breisach, Istein). These 16 active and reserve divisions were to be supplemented a few days later by 6½ Ersatz divisions, and mixed Landwehr brigades, which were grouped in some cases in "Landwehr Commands."

In all, the formations assigned to the western theatre of war comprised 68 active and reserve divisions, 6½ Ersatz divisions, 17½ Landwehr brigades and 10 cavalry divisions.

The First Operations of the Germans.—The first operations to be carried out were: (1) The seizure of Liége and of as large a foreground as possible beyond; (2) the securing of the left flank of "the Army," and the attraction of as many French divisions as possible to Lorraine and Alsace, by the living and passive forces under Prince Rupprecht. Both these essentials having been provided for, the five armies (I.–V.) were to proceed at once to the main task, which was to be a great "wheel through Belgium into France, pivoting on Thionville–Metz," in which wheel the II. and I. Armies were to govern the pace. The II. Army was to swing on the arc Liége–Wavre, the I. following in echelon on the arc Tongres–Brussels, flankguarding towards Antwerp, whither, it was presumed, the Belgian field army would retire. No very distant objectives were fixed. When Liége and the region W. of the Meuse had been occupied, and the cavalry divisions of the I. Cavalry Command had fixed the situation of the Belgian army, of the British forces expected to land at Ostend, and of the French forces which might be pushed into Belgium from the S., specific orders could be given. Meanwhile, the problem was to deploy the two highly condensed armies of Kluck and Bülow on the W. side of the Meuse, in spite of Liége and of the Belgian field army. On this, as the I. and II. Armies were to give the time to the rest, the whole movement depended; but while the III., IV. and V. Armies awaited developments, the 2nd and 4th Cavalry Commands were to push through the Ardennes and towards Damvillers, in order to clear up the situation in the Meuse valley from Namur to St. Mihiel—a mission which naturally brought about a series of conflicts with the French cavalry, and, above Stenay, with the French protective infantry system in the Woëvre. In point of information, this cavalry activity probably yielded only confirmations of the obvious, but it was invaluable in veiling the army movements when later these were begun.

The Liége operation is described under LIÉGE. There was no surprise, Belgium having mobilized her available forces at an early date in the European crisis; and five out of six brigade attacks on the night of Aug. 5–6 failed. One, however, penetrated into Liége, and for some days neither the German nor the Belgian, British or French Commands seem to have been able to form a clear view of the situation, as the fort-ring held out. Reconnoitring patrols of the German 2nd Cavalry Command, which passed the Meuse near the Dutch frontier simultaneously with parts of the attacking force, learned nothing of the Belgian dispositions, and the main body remained near its bridge. On Aug. 8 the situation at Liége was clear enough to enable the cavalry to push westward, and in the days following it established the front of the Belgian field army as lying approximately on the Geete line from S. of Jodoigne to Diest. But on Aug. 12, the attempt of the Germans to work round to the left of this position was checked in a severe local action at Haelen. The Liége forts, meantime, had to be reduced by super-heavy siege artillery, one by one, and it was not till Aug. 15 that the masses of the German I. and II. armies were able to begin to cross into the area comprised between Liége and the Geete. The resistance of the Liége forts had put back the start of the great wheeling movement for four days.

Thus the difficult and essential preliminary operation of seizing a bridgehead beyond the Meuse did not pass off quite according to programme. It had often been alleged that the Germans had obtained a long start in their concentration by means of surreptitious mobilization. That this was not actually the case has been shown by a study published in 1920 by the Belgian General Staff; but even had such a mobilization taken place, it would not have helped to solve the problem of Liége. All that infantry could contribute to its solution, the first six peace-strength brigades contributed. The rest was a matter of siege artillery, and it must be regarded as a serious flaw in Moltke's plans that this artillery did not put in an appearance on Aug. 6 instead of on Aug. 10.

On the other flank, the operations in Lorraine and Alsace, which were to maintain the "pivot" of the wheel against French attack proceeded more favourably than had been anticipated—too favourably, as the sequel was to show. The problem was difficult, and *a priori* reasoning could not assist its solution materially. For here, much more than on the Belgian flank, events depended upon the independent will of a great enemy army which was equally capable of the offensive or of the defensive-offensive; and although the tendency of French military thought in the last years before the war had evidently been towards the former, it was not clear how far this tendency had actually gone. Prince Rupprecht's task included not only the maintenance of the Metz–Thionville pivot but the attraction of as large a force of the French as possible; and if their old policy of defensive-offensive still held good, then, in order to set up this attraction, he must attack. If not, although attack would not be necessary, a much larger proportion of the total force than that which Schlieffen had thought sufficient would have to be allotted to the front E. of Metz. For Schlieffen had reckoned with certainty on a defensive-offensive policy in his opponents, and had argued therefrom that no deep inroad of large forces into the Rhine lands would in fact be attempted by the French, when a tidal wave of seventy to a hundred German divisions was advancing through northeastern France. But the situation was quite different if the French offensive in full force was to be launched at the outset, while the tide in the N. was still dammed up. For these reasons, Prince Rupprecht was given about one-quarter of the total available forces, and instructed: (*a*) to take the offensive over the Lorraine frontier in order to draw upon himself as much as possible of the enemy's forces, in the event of these being handled according to the old policy; (*b*) to prepare a great defensive system, Metz–Lower Nied–Saar–Vosges–Strassburg, against the contingency of an immediate powerful offensive of the French; (*c*) in the latter event, to suspend the offensive initiated in accordance with (*a*), and to draw back from line to line till the Saar was reached, where a standing defence would be made in conjunction with counter-attack on the French left from the Metz–Nied system. In the least likely alternative of only minor forces of the French being met with in Lorraine, Prince Rupprecht might utilize the Metz system to cover the transfer of part of his forces W. of the Moselle for coöperation with the V. Army. Upper Alsace was to be held against light forces, but evacuated step by step if seriously invaded. The VI. Army with the 3rd Cavalry Command was assembled accordingly in Lorraine, the VII. Army (minus two expected Italian cavalry divisions) in Alsace; and mobilized and civil labour on a large scale was employed in creating the "Nied" position, which ran from where the newest Metz works touched that river to its mouth N.W. of Saarouis.

The French I. and II. Armies, ready for operations as soon as the Germans, spared the latter the necessity of testing their intentions by advancing on Aug. 14 in great force. Accordingly, the German VI. Army drew back from position to position, while the VII. Army, which had defeated the first inroad of the French VII. Corps at Mülhausen, likewise drew back gradually before the army of Pau, dispatching part of its forces by Zabern to the upper Saar to assist the VI. Army's defence, and preparing with the remainder to hold the line Schirmeck–Molsheim–Strassburg firmly. But this withdrawal, after making all preparations for the offensive in the first place, was only unwillingly and half-heartedly carried out by Rupprecht's headquarters. And when, on Aug. 17, news arrived from Moltke that the French advance into Lorraine was, after all, not their main offensive, Rupprecht determined to fight on the line of his rear-guards on Aug. 20. Thus, just at the moment when the French had decided to push their offensive without further hesitation, the Germans changed their policy into one of flank attack. The battles of Morhange (Mörchingen) and Saarburg followed (*see* FRONTIERS, BATTLES OF THE: section *Lorraine*), in which the Germans were victorious. A hot pursuit was initiated, and with that disappeared for the time being all possibility of drawing off any part of Prince Rupprecht's forces for the benefit of the " Army." Moltke's rolling-stock on the Rhine waited in vain. The Commander-in-Chief in the Rhine lands had brilliantly performed both his tasks, but he had become a commander of two ardent armies who could see only the enemy in front of him.

The German Advance through Belgium and France.—Once the Liége foreground had been secured, and the pivot of Thionville–Metz been made firm, there was no need, in Schlieffen's opinion, for overhaste in the development of the main operation, which required principally power. Moltke, on the other hand, sought to remedy the reduction of power on the striking wing by urging it to speed. This was not easy, for the administrative and technical marching arrangements required for drawing the five or six corps of the I. Army through the narrow tunnel between Liége and the Dutch frontier were complicated, while Bülow's II. Army displayed no great energy in crossing the Meuse above Liége. Thus the Belgian main army was left undisturbed on the Geete—the most forward position which it could safely adopt in view of the risk of being outflanked by a German movement through Dutch territory—till Aug. 19, when, threatened with severance from Antwerp, it began to retire westward with but little fighting. Even then, however, the task of the German I. Army was by no means clear. The possible arrival of a British Expeditionary Force on its outer flank was a standing menace, and until the true right flank of the system, Bülow's II. Army, had begun its advance in earnest its protective echelon (I. Army) could not operate to any purpose. On the evening of Aug. 19—the 18th day of mobilization—the outer flank of the wheel had only reached the line Thildonck–Tirlemont (I. Army)–Sart Ribsart–Mehaigne (II. Army), while the armies traversing the Ardennes were at Marche (III.) and Bastogne–Arlon (IV.) respectively. The V. Army was just beginning to draw out of the Thionville area towards Longwy. On Aug. 20, learning that a large French army had been assembled in the Charleroi region, Bülow prepared its encirclement by beginning to wheel-in not only the II. Army's right wing but the I. Army (then under his orders) as well; but as the coöperation of the III. Army moving on Dinant was intended, that army, as well as the I., had to be given time, and the concentric blow upon Lanrezac was fixed for Aug. 23, while the left wing of the II. Army was to attack Namur from both banks of the Meuse. Had these measures been carried out, the " vast wheeling movement " would, on the 22nd day of mobilization, have occupied the line Nivelles–Charleroi–Dinant–Neufchâteau–Arlon–Thionville instead of the line Ghent–E. front of Maubeuge–Sedan–Thionville, as Schlieffen had planned for that day. But the fact of being a few days in arrear was of small importance relatively to the fact that, instead of continuing to swing out, the German line would be beginning already to roll in. The essential principle of the movement, that of outflanking not only the momentary position, but also any and every position of the enemy's left wing, was sacrificed. The British Expeditionary Force, unlocated, lay outside instead of inside the scope of the wheel.

But during Aug. 20–23 events crowded upon one another at almost every point of the German line. The left wing of the II. Army stormed Namur, with the powerful aid of the super-heavy artillery (this time deployed from the outset), while the right became engaged front-to-front with Lanrezac (*see* FRONTIERS, BATTLES OF THE: section *Charleroi*). The I. Army, advancing in echelon to the battlefield indicated by Bülow, but seeking still to preserve both its rearward echelonment and its power of extending outwards, came into contact, with its left wing, with the British Expeditionary Force in the neighbourhood of Mons (*see* FRONTIERS, BATTLES OF THE: section *Mons*). Meanwhile, the German III. Army, drawing out of the W.S.W. direction in order to coöperate in the battle proposed for Aug. 23, had lost touch with the situation of Bülow's army (apparently through the neglect of the latter to keep Hausen posted as to events on the Sambre), and the IV. Army in the heart of the Ardennes had already begun to wheel forward and southward in order to protect Hausen's left when it received the full weight of the French IV. Army's offensive from the Chiers. Lastly, the V. Army, on which a defensive attitude was at first imposed by the Supreme Command, managed to convert its defensive, flushed by success in the battle of Longwy, into a flank offensive which threatened to create a gap between the five armies and the Thionville–Metz pivot, on which they were to wheel. (*See* FRONTIERS, BATTLES OF THE: section *Ardennes.*)

Thus, at almost every point, local situations and the initiative of army commanders and troops turned the smooth and regular tide into a series of eddies. On the German side, as on that of the Allies, the northern half of the battle of the Frontiers was a chain of fierce local battles which only a very strong Higher Command could take in hand, either to straighten the links or to reforge them in a different pattern.

From that point to the battle of the Marne, the contest is less between schemes, less even between armies, than between the capacities of the two Supreme Commands.

At the head of the German armies was a man in indifferent health, by nature kindly rather than insistent, one for whom responsibility was rather a burden than a source of strength. He carried, moreover, the strain of watching and attempting to direct affairs on the eastern front. His opponent was a different man and differently placed. Essentially authoritative in temperament, sound in health, and concerned with one task only, Joffre was a commander in the full sense where Moltke was a responsible adviser only. Leaving the details of planning to his staff, and in particular to General Berthelot, Joffre devoted himself entirely to the rôle of commanding. His personal activity in the days after the battle of the Frontiers is astonishing, but it is essentially of the moral and not the operative kind—deciding, encouraging, punishing—the rôle of King William I. in the war of 1870–1, and one which the Emperor William II. was unable to sustain in 1914. Add to the factors weighing against Moltke, the prestige and confidence of his army commanders, most of whom had won victories, none sustained defeat, whereas no French subordinate general had obtained an important tactical success, and it is evident that the higher control was necessarily firmer on the side of the French than on that of the Germans.

The prevailing impression on the German side after the battles along the frontiers was that a decisive victory *had* been won, and that the next phase was to be one of exploitation. The consequences of this impression, which soon penetrated to General Headquarters, were: (*a*) the decision to send six corps (two from each portion of the line) to the East Prussian front; (*b*) freedom of action granted to the V. Army to cut loose from contact with Thionville and join in the general pursuit by a movement round the N. of Verdun; (*c*) non-interference with Prince Rupprecht's pursuit in Lorraine; and (*d*) a new orientation of the I., II., III., IV. and V. Armies, which, abandoning the "wheel," were to advance in line in a general S.W. direction, with the I. Army heading for the lower Seine, the II. for Paris, the III. for Château-Thierry, the IV. for Epernay, and the V. for Vitry-le-François, the last-named flankguarding against Verdun and the first preserving a defensive echelon on its right.

The new orders were issued on Aug. 27, after the battle of Landrecies–Le Cateau had accounted for all undisclosed British forces and established the feebleness of the French cordon to the left of them, while the III. Army was well S. of Rocroi and the IV. bordered the Meuse from Sedan to Stenay. They were not executed with the certainty and confidence of an exploitation. The V. Army, in the act of letting go its connexion with Thionville–Metz, had on Aug. 25 exposed its left flank to a very sharp offensive of the defensive portion of the French III. Army now styled "Army of Lorraine," under General Maunoury, whose progress had been stopped only by orders from Paris. The French III. and IV. Armies, quickly rallied from their Ardennes–Longwy defeats, gave ground only slowly and with frequent counter-strokes (*see* FRONTIERS, BATTLES OF THE: section *Ardennes*), and the German III. Army was continually drawn southward, off its line of advance, to assist the IV. in real or supposed crises. Thus a great gap opened up between the III. Army and the II.; and the latter, uneasy as to its left flank, gradually drew away into a southerly direction, while Kluck's I. Army continued S.W. on Amiens. Almost immediately thereafter, the I. Army began to come into contact with French forces, distinctly superior in number and in quality from those hitherto met on this outer flank. While driving these back in various minor actions, and expanding ever westward in so doing, it was suddenly checked and caused to swerve southward by demands for assistance from the II. Army, which, unsupported on its left by the III., found itself counter-attacked, with a vigour that had not been observed since Charleroi, by Lanrezac (*see* GUISE, BATTLE OF). This crisis, like similar crises on a smaller scale in the area affecting the IV. and III. Armies, passed away after a time, but the disintegration of the German mass-movement had now reached a climax. Apart from regulating special questions between armies as they arose, the German Higher Command had not intervened in the conduct of operations since its instruction of Aug. 27. On the night of Aug. 31, the I. Army, in the vain hope of seizing the left flank of the British or of Lanrezac, had pushed its left far to the S. to the Aisne below Soissons, while its right was in the Lassigny hills and W. of Montdidier and even farther north. The II. Army had not progressed beyond the Guise–St. Quentin battlefield, its front facing due S. between Essigny-le-Grand and Vervins; the III. Army on the contrary was on the upper Aisne on both sides of Rethel, the IV. astride the northern Argonne between Semuy and Buzancy, the V. wrapping itself round the N. side of Verdun while still maintaining considerable forces in the Woëvre facing the E. front of that fortress, and the Côte de Meuse. Two corps had left for the eastern front, belonging not to the subsidiary armies in Lorraine but to the striking wing. One corps had been left to face the Belgians in Antwerp, one and a quarter corps to besiege Maubeuge, other detachments here and there to guard lines of communication or to invest small French forts such as Givet. The only new forces on their way to the West were the two divisions of the IX. Res. Corps and certain Ersatz brigades, all of which were needed to support the dangerously weak cordon of the III. Res. Corps facing Antwerp and to be on the spot in case of a Russian and British landing at Ostend, rumours of which at this time filled western Europe.

In Lorraine, the pursuit from the battlefields of Morhange and Saarburg had led the German VI. and VII. Armies in a southerly direction, substantially on Rambervillers and Charmes. Forced to condense into two main groups by the fort of Manonviller—a work condemned as useless by peace-time critics—and by the forest of Parroy, they had exposed their right flank to counter-attack by the restored army of Castelnau, which held the fortifications N. and E. of Nancy and the north flank of the so-called Trouée de Charmes. This French counter-stroke not only gravely imperilled Prince Rupprecht's army—for Manonviller resisted long enough to act as an anvil to Castelnau's hammer—but deprived the German Command in Lorraine of its initiative. With that loss, it forfeited all real power of holding larger French forces in its front; and though the German Supreme Command, in the same confident general instructions of Aug. 27 which initiated the southwestward pursuit of the I.–V. Armies, ordered the Bavarian Prince to break through the French line in the direction of Neufchâteau on the upper Meuse, it soon appeared that Joffre had the "inner line." He could take troops from Lorraine for other service, while his opponent could only continue costly holding attacks that did not hold.

On Sept. 1 the German Supreme Command gave up the conception of a general southwesterly pursuit, which, by its incidents, had not only lost its direction but brought the armies into a very irregular array and resumed the original conception of the wheel pivoting on Thionville, or rather, in the new situation, on the troops of the V. Army facing the N. side of Verdun. By now, however, with losses and detachments, the frontage of such a sweep was reduced by the front of a whole army, if not two armies. The appearance of French active and reserve forces N. of Paris made it clear that a protective echelon—such as had always been prescribed and rarely formed by the I. Army—would have to follow the rear of the army on the outer flank, and, moreover, the gap between the II. and III. Armies must be closed. The new general instructions, therefore, prescribed that the II. Army should steadily drive the French in a southeasterly direction, followed in echelon by the I., which was to watch Paris and break up the communications leading thither. But almost immediately after the I. Army, still well in advance of the II., received this order, one of its corps, exploiting a local advantage, crossed the Marne at Chézy and Château-Thierry, and Kluck determined to support it rather than withdraw it. The Supreme Command made no protest, all the more so as he reported evidences of real dissolution in the ranks of the retreating enemy. Kluck pushed on. The echelon facing Paris was maintained, but it was growing thinner and thinner. On Sept. 4 the Supreme Command, in increasing uneasiness, limited the offensive front still more. Not only was the I. Army to stand fast between the Oise and the Marne, but the II. Army was to wheel outwards and fill the space between the Marne and the upper Seine. The III. Army, now become the operating wing, was to march on Troyes and to the E. thereof, continuing in close liaison with the IV. and V. while the Lorraine armies were to renew their attempt to break through the upper Moselle front.

The final phases of the battle in Lorraine represent the endeavour of exhausted forces to carry out their part in this scheme. The central and western portion came to nothing, for although Kluck began at 23:00 hours (11 P.M.) on Sept. 5 to counter-march his army so as to fill the space between the Oise and the Marne, now guarded only by the last relic of his echelon, and Bülow gained ground between the Marne and the Seine as far as Montmirail and the marshes of St. Goud, General Joffre had, on the afternoon of Sept. 4, issued the command to his armies to face about and attack.

The Preparation of the Counter-Offensive.—While on the German side we see the battles of the frontiers followed by a high-spirited chase in which the driver was able to keep little more than the semblance of order in his team, on the French side the picture is one of an astonished and confused, but in no sense a routed citizen-army, too clear-sighted to believe itself betrayed and yet too ignorant of the ensemble to see where miscalculations had led to disaster. In the hands of one who had specialized in the art of inspiring confidence, whose silence even was imperturbable, and whose career had been spent not in technical subtleties of operations but in varied branches of administration, it had every chance of early recovery, provided that it was handled according to a definite policy and not exposed to incidents. This definite policy was laid down in a general order of Aug. 25, which began with the phrase: "As it has proved impossible to carry out the projected offensive, the next operations will be regulated so as to constitute on the left,—by means of the IV. and V. Armies, the British army, and new forces from the eastern front,—a mass capable of resuming the offensive while the others hold up the enemy for the required time." Following this cool and convincing statement, the detail paragraphs prescribe a retreat to the line Braye-sur-Somme–Ham for the British, to Vermand–Moy for the offensive portion of the V. Army, to La Fère–Laon–Craonne–St. Erme for the defensive wing of that army, to the middle Aisne for the IV. Army and to the Argonne–Verdun line for the III. "From this situation the offensive will be resumed," said the order. On the left of this line a barrage against cavalry inroads was to be formed between Picquigny and the sea, and either between Domart and Corbie or between Picquigny and Villers-Bretonneux there was to be formed a new army, soon to be designated the VI., and composed, as regards its staff and several of its divisions, of the troops which had just defeated the left of the German Crown Prince as it sidled past Étain. This was to be ready for action on Sept. 2, and the direction of its offensive would be either St. Pol–Arras or Arras–Bapaume, according to the position of the extreme right of the Germans. The British would attack on Bertincourt or Le Catelet, according to the situation, the V. Army wing on Bohain. The right of the V., the IV., and the III. were to defend the line laid down and eventually to attack from it. To the I. and II. Armies went the laconic instruction, "the rôle of these armies is, to endure."

But the pressure of the German pursuit in its first freshness did not admit of the British coming to a halt on the line ordered, and when the elements of the new VI. Army began to assemble about Amiens the battle had passed far to the south of them. Similarly, with the V. Army, the battle of Guise, which may be considered as a section of the proposed general offensive, led to small results because the British element was wanting on its outer flank. The controversies which have arisen as to the rapidity of the British retirement from the battlefield of Le Cateau to behind the Oise need not here be discussed, for it is more than doubtful in any case whether the state of the French army, in its ensemble on Aug. 31, justified the risk of incurring final defeat. Be this as it may, Joffre put aside all temptations to exploit the local successes at Guise on the Meuse, and in a new general order of Sept. 1 laid down that the VI. Army and the British having insufficiently checked the enemy's turning movement, the whole system must pivot about its right continuing to retreat, until the left of the V. Army should be free from the menace of envelopment. Then the armies would take the offensive, this time utilizing the position of the III. Army, protected by Verdun on the N. and the Côte de Meuse on the E., to strike the chief blow. The position from which the offensive would be resumed was now well back from Paris, which was to be left to itself (though Joffre suggested that its troops might coöperate in the general offensive), the V. Army behind the upper Seine (Nogent), the detachment Foch (IX. Army) and the IV. Army behind the Aube and S. of Vitry, the III. Army, augmented by defence troops borrowed from the Côte de Meuse and possibly by troops from the Lorraine front, N. of Bar-le-Duc. The British and the VI. Army were to constitute with Galliéni's local troops a Paris group which should hold the Seine from Melun to Juvisy, and the E. and N.E. fronts of Paris.

Thus was prepared the initial situation of the battle of the Marne. The scheme as outlined at first underwent many modifications, due to the ardent initiatives of Galliéni in Paris, and of Sarrail, commander of the III. Army, S. of Verdun, as well as to other causes. These are discussed in the article MARNE, BATTLE OF THE. Here it is not necessary to analyse too closely the form projected for the battle. Essentially, the fact to be retained by history is that a great army, in retreat after failure, could be energized, ordered to turn about, and launched to the attack, by a modern commander-in-chief whose influence must filter through a complex hierarchy before reaching the fighting soldier. Many had believed this to be an impossibility, and they were proved wrong. The operative scheme of the battle of the Marne and even its apparent barrenness of specific military results, are of insignificant importance compared with the fact that the battle of the Marne was actually fought. (X.)

The "Race to the Sea."—The establishment of the German defensive on the line of the Aisne, prolonged across the plain of Champagne, which ended the Marne battle, did not put an end to the Anglo-French offensive. The front between Compiègne and Verdun was stabilized here and there, but the battle of movement continued at the free extremity, that is, to the W. of Compiègne, and beyond. This new offensive has improperly been called the "Race to the Sea." In reality it was not a question of reaching the coast as quickly as possible, so as to obtain there an absolute protection against turning movements. If it had been so, the shortest line for the Allies, and the easiest to hold, would have been that of the Somme, from Compiègne to Montdidier and Amiens. To the estuary of the Somme, this line does not measure much more than 100 km., while the line from S. to N., which was that of the actual "Race to the Sea," ended N. of the Yser and was nearly double that length, presenting features of very various nature, among which some entirely lacked defensive value.

The truth is that the offensive, which was throughout the policy of the French Command, did not stop at the Marne victory. On Sept. 11, when the VI. Army (Maunoury) arrived at Compiègne, the Commander-in-Chief gave the order for this force to place immediately as many troops as possible on the right bank of the Oise. On Sept. 17 he indicated his plan by ordering the formation, on the left wing, of a force capable of parrying a flanking movement by the enemy as the best precaution to be taken. But Sir John French has stated that on the very next day (Sept. 18) General Joffre informed him that he was developing a new plan which aimed at attacking and enveloping the German right flank. The enemy, moreover, showed by his method of occupying the ground that the initiative no longer rested with him.

At the extreme end of the Allied line on the Oise the valley of the Aisne cleaves its way through a forest-clad massif, cutting it in two S. of the Aisne; the larger part of this mass consists of the forest of Compiègne and the northern part is the forest of Laigne. If the Germans, very skilled in turning forests to military account and manœuvring in them, had retained any hope of resuming the offensive against the Allied left flank, they would have occupied the forest of Compiègne in order to make it the starting point of their turning movement and force the Allied left to retreat towards Paris. But they abandoned that front; nor did they retain the forest of Laigne, on the plateau to the N. of Attichy. The offensive impulse in the World War was thus on the side of the Allies and they kept it until the fatal day of Russia's defeat on the eastern front. Until that time every attack which resulted in the gain of ground came from the Allies, who, save for a few occasions, methodically pushed back the enemy from one entrenched position to another. The Germans had later to defend their right flank, more and more threatened as it became more and more prolonged. And, as the best way of arresting the progress of the Allies would have been to strike at their offensive, they tried without ceasing to outflank them, while they were resisting in front.

Thus the "Race to the Sea," viewed as a whole, consisted in establishing an offensive Allied flank against the German right, and, this flank being always unsupported at one extremity, in German efforts to seize this extremity from two directions. These attempts, on either side, taking place farther and farther from Compiègne, appeared as a "Race to the Sea"; but in reality neither side was deliberately making for the coast. The S.–N. direction taken by the line of contact was not sought by either opponent; it resulted from the balance of forces.

It is evident that, whatever resources on either side were furnished by reserves and new formations, the extension of the front of contact over a length of 200 km. was only possible on condition of leaving much thinner forces on the stabilized front than had been required for the battle of movement, from Aug. 20 to Sept. 12. In proportion as the lines extended to the N., transferences took place, depleting the line from Belfort to Compiègne, as had already been done in the Vosges and in Lorraine, to enforce the regions where the struggle was being carried on in open country.

As regards such transferences, the advantage was with the Germans, because they occupied the interior of the angle whose apex points to Compiègne, while the Allied troops had to be moved around this point.

On the German side, the manœuvre brought 18 new army corps into the line. On the Allied side it resulted in the transference of the II. Army (de Castelnau) between the Oise and the Somme; the formation of the X. Army (Maud'huy), N. of the Somme, and the VIII. Army (d'Urbal), which included the Belgian army, brought back from Antwerp; and lastly in the shifting of the British army into Flanders. To these transfers and new creations must be added various formations constituted on the spot, of which the most important was a group of territorial divisions placed under the orders of General Brugère. Some of these formations had already joined in the offensive after the battle of the Marne, notably at Amiens, which they had cleared of the German units scattered through Picardy and Artois. This ensemble was placed under the command of General Foch, but was only brought to completion by degrees. The successive steps will now be described.

The first offensive action against the German right began on Sept. 11, in accordance with the order given by General Joffre. It was carried out by the VI. Army, with one additional corps on the right bank of the Oise. It immediately encountered energetic resistance on the Aronde, a small tributary prolonging the depression of the Aisne valley on the opposite side of the Oise. On the northern bank of this stream wooded heights extend between Compiègne, Lassigny and Noyon, and surround Ribécourt—names which all became famous during the war.

The VI. Army had a difficult task in the subduing of them, and could hardly have achieved it, threatened as it was with an attack in flank, without the help of the II. Army (de Castelnau), which, detraining in the Clermont–Beauvais area, had to cover 30 or 40 km. in order to outflank the German right. At the same time the cavalry and the territorial divisions of General Brugère extended the movement towards the north.

The resulting battles were prolonged until the end of Sept. with alternations of success and reverse, through Lassigny, Roye, and Chaulnes, as far as Péronne. From Péronne to Lassigny, where the wooded hills ceased, the terrain consisted of undulating plains, where no line of battle could be found. It was thus the balance of forces that determined the front of contact, which was gradually fortified on either side.

On Sept. 24 the French retook Péronne and lost it again. This little place, in a hollow, offering no possibility of outlook or of action outside its walls, had no military value. The positions which should have been occupied in the circumstances were the heights of the Somme above Péronne which formed a very considerable obstacle. The great value of this line, especially facing eastward, owing to the command of the country in that direction given by the heights, did not escape the German staff, and for a long time their efforts were directed towards preventing the Allies from securing the heights, by the defence of improvised fortifications, at some distance in front of them. Later it will be seen how these lines were linked up with that of the Ancre.

It will now be shown how, after the preliminary fighting, the German front became established between the Aisne and the Oise. A salient is always a weakness. The front was fixed from E. to W. along the Aisne; and the flank resolving itself into a new front running N. and S. the German line exhibited a right-angle salient pointing towards the forest of Laigne. It was very largely to smooth out this salient that the line was traced behind the forest in such a way as to form a great arc instead of a point. South of the portion of the line of the Somme between Péronne and Ham it was necessary to connect this arc with the fortified line S. of Péronne; the line Chaulnes–Roye–Lassigny was thus strongly indicated as the connecting line.

On Sept. 23 there was fighting near Lassigny, on Sept. 25 near Roye, and on Sept. 29 in the same places and also at Chaulnes, where the Allies were repulsed, as they were at the salient itself. On Oct. 1 the fighting-line extended to near Arras. It will be seen how it came to be fixed on the N. of Péronne.

The old fortress of Arras, which was no longer more than half fortified, but whose citadel had been maintained in good condition, was a *point d'appui* for the Allies. The interval, 40 km. wide, between Arras and the Somme, provided some features which were favourable to the establishment of a line. First, near Arras, there was the little valley of the Crinchon. The stream itself is unimportant, but its banks afford positions which are good in default of better ones. Next, a connecting line had to be ensured over about 15 km., from N. to S., across the undulating plateau, to the course of the Ancre, which forms a deep ravine both above and below Albert. The river bends in a S.W. direction as far as Corbie on the Somme.

Thus the line traced by the depression favourable to a line of resistance forms a series of zigzags: the Ancre near Albert, the Somme from Corbie to Péronne, the Somme from Péronne to Ham. It was because of this peculiarity that the Germans, when they were defending the line of the Ancre, opposite Albert, could not make use of the section of the Somme between Péronne and Ham, because it was 20 km. to the rear. Their solution consisted therefore of drawing a line through the Corbie salient, behind which lay Combles, transformed into a magazine and supply depot. This brought them in front of the section of the Somme between Péronne and Ham.

During the "Race to the Sea" the fighting round Albert and Arras (*see* ARTOIS, BATTLES IN) began at the end of Sept. and on Oct. 1 respectively. The X. French Army then came into the line. The Germans were already strongly entrenched on the Thiépval plateau, opposite Albert, where they were to pile up the defensive works which the British were to capture, one by one, two years later.

On Oct. 2–3 the X. Army (Maud'huy) made an effort to seize the German flank at its northern extremity by moving forward to Douai, where there had been for some time a detachment of the territorial army, which did not succeed in maintaining its hold. But the Germans opposed with heavy forces of infantry and cavalry. The French were pressed back; the enemy occupied Lens and made a vigorous but unsuccessful attack on Arras. For a long time afterwards the Allies' line left Lens in possession of the Germans, lying farther westward on a line from Arras towards Béthune. Arras was included indeed, but the important positions of Vimy and Notre Dame de Lorette, of which the Germans would not lose hold, were cut off. Their importance consisted in their facing N.E. and later their capture necessitated long and painful effort.

The German cavalry was in all the country which lay beyond in the N.; it occupied Ypres and Bailleul, and sent out patrols still farther forward. The situation was very difficult for the Allies, and its improvement was an urgent matter. The VIII. Army (d'Urbal) had its base at Dunkirk, but it was still inadequately constituted. The French cavalry and General Brugère's territorial divisions were maintaining an arduous and very fatiguing struggle. At that moment the British army, which could now be withdrawn from the Aisne, as that front was strong and solid and could be held by a small force, was summoned N. Reinforcements were also brought from the eastern area, and lastly the Belgian army, no longer of any use in Antwerp, came to take its place in the ensemble. The story of the siege of Antwerp and of the escape of the Belgian field army from the place is told under ANTWERP.

At the time of the fall of Antwerp Sir John French and General Joffre met at Doullens, on Oct. 8. The British II. Corps arrived on Oct. 12 near Béthune and Aire, and was able to attack the enemy's flank in a combined operation with the X. French Army. The III. Corps detrained at St. Omer on Oct. 12; the I. followed. Finally the IV. Corps, supporting the Belgian army in its retreat, would rejoin the rest.

It is evident that if the organization and transport of the new army corps which were to swell the forces of Sir John French had been accomplished more quickly, and the N. of France occupied earlier, that region would have been more easily freed from the enemy invasion, and the blow at his flank aimed at by the Command would have resulted instead of the "Race to the Sea." But it must not be forgotten that Great Britain created this new army *ab ovo*—a stupendous military effort—and that armies cannot be improvised. Until about Oct. 8, the Germans had only cavalry in the regions around to the north of Lille. It was then strengthened by the arrival of a strong army corps, which came from the neighbourhood of Antwerp by way of Courtrai.

The Lille Question.—On Oct. 8 the enemy arrived before Lille. The fortress closed its gates and resisted with the few troops that it possessed. The Germans did not trouble to attack it in earnest. They contented themselves with bombarding the town from a distance and demolished about a thousand houses. On Oct. 13, after five or six days of bombardment, Lille yielded. This short resistance was not useless, for it enabled the British army to take up its position behind Lille and to consolidate it. The question of Lille gave rise to much discussion in France. The arguments cannot be examined here, but a few words must nevertheless be said on the subject. If it had held out longer, it might have formed part of the battleline, like Reims, in which case it would inevitably have been destroyed, and with it the industrial towns of Roubaix and Tourcoing. Should the sacrifice have been made? The British front would have gained about 15 km. on the E. but the general line would have passed along the Yser on the N. and through Arras on the S. just the same. It would, moreover, have been difficult to find a good connecting line to link up Lille and Arras, across country very ill-adapted for defence, especially in the southern half. If the defence of Lille had been included in the general scheme of operations from the beginning, a very strong garrison must have been left there, proportional to the extent and number of works of the entrenched camp. It would have had to be an immobilized force whose task was to immobilize an enemy force also, as at Maubeuge. But it would not, any more than Maubeuge, have hindered the enemy's turning movement. Thus, to assume the resistance of Lille, until the arrival of the British army at the beginning of Oct., is to assume that it could have sustained a siege and bombardment from the last week in Aug. onwards—that is, for over 40 days. The fate of other isolated fortresses, such as Liége and Antwerp, leaves no doubt that this would have been impossible.

On Oct. 12 a junction was effected between the Belgian army, retreating towards Ypres with the French marine fusiliers, and the II. British Corps (General Smith-Dorrien) in the region between Béthune and Bailleul, along the canal and the Lys, while the III. Corps (General Pulteney) marched on the left of the II. towards the line running from Armentières to Ypres, to occupy the heights of Messines, later so fiercely disputed. On Oct. 13 the British cavalry, which held the left of the advance, took the heights which stretch between Cassel and Messines (Mont Noir, Mont des Cots, etc.) and which are of great military importance. On Oct. 14 the II. Corps entered Bailleul. The same day General Byng's cavalry division arrived at Ypres, with a French territorial division.

Definition of the Front of Contact.—Although the struggle never ceased and a great German offensive was immediately prepared in Belgium against the left of the line, at Ypres, on the Yser, the "Race to the Sea" must be considered to have ended on Oct. 15 1914, the date on which the Allies occupied the whole front from Ypres to the sea. At that date the left, on the Yser, was at Nieuport, and possessed a bridgehead at Lombartzyde in advance of the line of the river and near its mouth. The Yser front passed through Dixmude. To the S. of that town it is delimited partly by the course of the river, which spreads out like a fan a little farther to the S., partly by the Ypres canal, after passing the ancient fort of Krocke. Then it goes beyond the canal to the villages situated farther E. on the stream of the St. Jean, in order to arrive at the heights which surround the basin of the Yser and its tributaries, reaching them at Gheluvelt, on the road from Ypres to Menin. It held the crest and the heights as far as Messines. The French were on the left, from Nieuport to Dixmude; the English on the right, on either side of Ypres: the Belgians were between the two, their feeble effectives occupying only a small portion of the front.

From the beginning the Yser front was well selected and lent itself well to defence, not so much owing to the obstacle formed by the Yser, as because the country behind, much cut off by water-courses, was very ill-adapted for an offensive by large masses. At the same time, this part of the front, which was entirely defensive, had not its full value until it was flooded. The dykes were burst open on Oct. 22, the floods then gained ground little by little as they rose higher. The effect was not obtained very rapidly, because the whole volume of water in the basin is not great. It did not hinder the enemy from crossing the river below Dixmude on Oct. 26, and penetrating thence to a depth of 4 km. till he was stopped by the lines in the rear, and especially by the railway embankment. But two days later the Germans were forced to retreat, partly by the Allied counter-attacks, partly by the water, which was spreading and rising. The part of the line which passed in front of the Ypres canal near the little river St. Jean could not be made very solid, but it was necessary in order to form a link with the Gheluvelt heights. But the true line of battle, which overlooked a large stretch of country to the E., was only attained in the last phase of the war, with the capture of the entire line of heights in the direction of Staden, at least as far as Westroosebeke, the point where the ridge is crossed by the high road from Ypres to Ghent. Also, during the whole of the first period of the struggle, the British army was always very vigorously attacked around Ypres and at Ypres itself. The most important *point d'appui* was the portion of the heights lying directly to the S. of Ypres, Wytschaete and Messines,—that is, the eastern end of the line of the Monts de Flandre, which run from Messines to Cassel and appear again farther on to the N. of St. Omer. These hills are of immense importance in the whole defence of Flanders. This was seen in the last phase of the war, when they fell into the hands of the enemy as far as Bailleul, and it took very hard fighting and the greatest energy to arrest his progress in this direction and to stave off still more fatal consequences.

Between the promontory of Messines and the cliff formed by the heights of Notre Dame de Lorette and of Vimy, above the plain of Lens, stretched a sector with a front of nearly 50 km. which afforded no continuous line of any length, and included only isolated strong-points, sometimes in a position favourable to the Allies, sometimes to the enemy. Those most useful to the Allies were the ridges of Messines and Vimy. The first was taken by the Allies on Oct. 15 1914; the second was at first occupied by the French, and later their success was repeated by the British. The French front line passed 2 km. to the west of Notre Dame de Lorette, the key to the position. The attack on this point began on Oct. 20; but the conquest of the whole ridge necessitated efforts which were renewed up to the middle of April 1917.

In the plain, about midway between Messines and Arras, is a point relatively stronger than the rest, owing to the canals and marshes which protect its approaches. This is the little town of La Bassée, occupied and strongly fortified by the Germans; and for a long time it delayed the progress of the British army. The difficulty of the advance towards Vimy was very largely owing to the part played by La Bassée in preventing the British in the plain of Lens from taking part in it, in striking at the rear of all their attempts in the neighbourhood of Lens, especially those which aimed at outflanking the town on the north. But hard as were the local struggles in the Messines–Vimy sector, no great action ever developed there until 1918: first, because as regards an Allied action a great offensive in the direction of Lille would have been very risky unless it was led up to by a more strongly protected movement either to the S. in the region of Arras, Peronne and Ham, or in the N. towards Belgium; secondly, because as regards a German action, the sector to be conquered to carry out a flank offensive against the Allied left was that of Ypres and the Monts de Flandre.

Such was the real meaning of the German project *Nach Calais!*, which cost the army of William II. so dearly. For the Germans, to engage themselves in the Messines–Vimy sector, in order to reach St. Omer, would have been to run into the jaws of a pair of pinchers formed on the N. by the Monts de Flandre and on the S. by the ridge of Vimy–Notre Dame de Lorette, extending to the S. of Béthune and Brie. It would have meant the formation of a salient, which would be more vulnerable the farther it was pushed in the direction of Calais. The result of all this was that almost up to the end of the war the front passing through Armentières and Arras underwent very little change.

It has already been related how the front was determined first between Arras and Albert, then S. of Albert in front of the Somme between Péronne and Ham, and lastly as far as the salient opposite the forest of Laigne. The attack on this very strongly fortified part of the German front was only begun in the early part of Dec. 1914.

At that time the French still held Thiépval wood on the enemy slope of the Ancre. Farther S., some fluctuations occurred on the plateau, in the region of Chaulnes and Roye. But there was no great action other than the Anglo-French general offensive, which developed between July 1916 and March 1917.

All this leads to the conclusion that the last half of Oct. 1914 may be considered to mark the end of the "Race to the Sea," and the establishment of equilibrium, except for local fluctuations, along the whole length of the immense line of contact. (H. Be.)

II. Trench Warfare, 1915–17

While weary British troops were handing over their lines in the salient to their French comrades at the close of the first battle of Ypres (*see* Ypres and the Yser, Battles of) and they had time to think of other things than the grim struggle that had just ended, it dawned upon them that the war in the west had entered upon a new phase. The trench barrier had been completed from the North Sea to the Swiss frontier, and a war of movement and manœuvre, for which most of them had been trained, had become impossible. This was a development which had not been foreseen by the military world of Europe and it took it by surprise. For the Germans this surprise was less unpleasant in the winter of 1914–15 than for the French and the British. When their second great effort to win the war in the west had failed they had decided to adopt a defensive policy in France and Belgium while they attacked in the east. Therefore they could regard the difficulties of attack upon trench lines and the restrictions of manœuvre with some complacency, while they were better prepared for the new type of warfare than were either of their opponents, more particularly the British. The fortifications of the French and Russian frontiers had compelled the Germans to study closely the art and science of siege warfare and to make preparations for such warfare. They had assimilated the experiences of the Russo-Japanese War and had learnt from them to their profit. Therefore trench mortars, hand and rifle grenades, searchlights and pistol lights, and the possibilities of mining, were to them no novelty; and having the plant ready for the manufacture of the material required for siege warfare, and considerable stocks of such material already in store, it was not difficult for them to meet quickly the demands made by their soldiers in the trenches on the western front.

The British army was in very different case. Its chiefs before the war believed that it would be employed only in a war of movement, and the study of siege warfare had been confined to a small body of engineers, amongst whom it was largely theoretical. All the money to be found for the Army Votes had been used in the training and equipment of the Expeditionary Force, and there was none left for the provision of the material required for the attack of fortresses. The cost even of hand grenades, with which experiments had been made when the reports of British observers in Manchuria came home, was held to be prohibitive. For these reasons the winter of 1914–15 was for the British infantry in France and Flanders a period of unmitigated suffering. The ebb and flow of attack and defence had left the Germans almost everywhere along the British front in possession of the higher and drier ground, while in the low-lands of Flanders water was found at a few feet and even sometimes a few inches below the surface; under incessant rain, parapets melted away unless held up by sand-bags constantly replaced, but the British army had not sand-bags in sufficient quantities. The construction of communication trenches was all but impossible, and material had to be brought up to the front lines by parties floundering through the mud at night. Lying in sodden trenches, before an enemy who possessed weapons which they had not, the British infantry endured at this time a longer and in many respects a severer test of their constancy than in some of the worst crises of the war. The strain upon the French was less severe because a small part only of the French army had to endure the incomparable mud of Flanders, and from the first it was better provided with H.E. shell, while the greater military resources of France made it possible to meet the new conditions more readily.

Operations in 1915.—While the soldiers in front were enduring and slowly learning to mitigate the horrors of trench warfare, those behind were planning. There were not lacking active brains in Paris and in London who saw that the assaults upon the ever-widening barriers of barbed wire and the evermore serried lines of trenches must prove a slow and bloody business. These brains sought eagerly for a way round the barrier which would lead to a speedier and less costly victory, and so began the controversy between "Easterners" and "Westerners" which endured while the war lasted. There were signs early in 1915 of preparation for an Austro-German attack upon Serbia; and Mr. Lloyd George, inspired by his friends in France, proposed at once to save a weak Ally and to attack the weakest link in the opposing chain by transferring the bulk of the British army to the Balkans and reinforcing it with the New Armies as they became ready for the field. Both the French and the British commanders-in-chief hotly opposed this proposal. The lines of communication through Serbia were long and difficult, and it was very doubtful whether they could be made to maintain an adequate force. The transference of the British army to the Balkans must in any event have taken many months, during which it would have been condemned to an inactivity of which the enemy on the inside of the circle, with not only shorter but better communications, would certainly have profited. The Balkan enterprise was therefore condemned, and the immediate outcome of the controversy on the British side was the starting of the Dardanelles adventure.

Joffre's plan was simpler. He desired to attack on the western front at the earliest possible moment and with all possible force. It was argued at the time, and has repeatedly been argued since, that it would have been better to have awaited the development of the British army and the increase of the Allied artillery and the improvement of their stock of munitions, and to have employed the interval in gaining advantages over less formidable foes in other theatres of war. To these arguments Joffre's answer was that the Germans were in occupation of a great part of France, that near Noyon they were only 50 miles from Paris, on the Somme they were barely 20 miles from Amiens, the main junction connecting the British and French in Flanders and Artois with the remainder of the French troops, while farther N. they were little more than 40 miles from Calais. At the beginning of 1915 he was assured of a definite numerical superiority over the Germans in the W., but the Germans had not nearly reached the limits of their man-power, and they might at any time call a halt on the Russian front, and by reversing the process which they had carried out after the first battle of Ypres bring back troops to France. A successful German attack at any one of a number of parts of the western front might gravely cripple the Allied armies, for German guns might be brought up to within range of Paris or of Calais, or the enemy might again occupy Amiens. The French commander-in-chief maintained that the security of the western front must be a paramount consideration in Allied strategy, and that to secure the position in the W. it was necessary to drive the Germans farther back.

Sir John French was in general agreement with Joffre's views. He at first desired a combined naval and military attack upon the coast of Belgium, but on receiving representations from Lord Kitchener that neither the men nor the munitions required for this operation could be made ready in time, he abandoned this proposal and set himself whole-heartedly to coöperate in Joffre's plans. These plans comprised a grand attack by the British army N. of the La Bassée canal and by the French northern group of armies under Foch on the front between the La Bassée canal and Arras. The hope was that this attack would give the Allies the Vimy Ridge and compel the Germans to evacuate Lille. In order that Foch might have the forces necessary for such a battle it was agreed between the commanders-in-chief that the British should relieve the French troops, who had occupied the Ypres salient when Haig's men had been withdrawn from it after the first battle of Ypres. Sir John French had at the end of 1914 received one more regular British division, the 27th, made up by Kitchener from foreign garrisons, while another, the 28th, arrived early in January. The 1st Canadian

Div. disembarked in France in the second week of February. This gave him a total of 13 infantry and 5 cavalry divisions, besides a number of selected territorial battalions. These reinforcements allowed him to form his command into two armies, the first under Sir Douglas Haig and the second under Sir Horace Smith-Dorrien, and at the same time to extend his front gradually N. into the Ypres salient.

A further integral part of the preparation for the spring campaign consisted of a number of attacks intended to divert the enemy's attention from the Artois front and to gain experience in the tactics of trench warfare. One of these attacks was carried out by the French during the winter against the salient of St. Mihiel, when they learnt that the position (which appears from a map to be almost untenable) could with the aid of trenches and barbed wire be made very formidable. Other attacks were made in Champagne on either side of the Perto and in Flanders. In the latter of these British troops coöperated by a minor attack opposite Wytschaete, which had very little success. In fact on the whole the Germans gained the chief success in this preliminary sparring, for in the middle of Jan. 1915 they made an attack upon the lines which had been held during the battle of the Aisne by the British army, N. of that river near Soissons, and drove the French back to the S. bank.

The British army, which like other European armies, had been trained to believe in the supreme virtue of attack, had since the beginning of the war, with the exception of the short period of the advance to the Marne and the Aisne, been compelled to fight defensively, and Sir John French desired to give it a wider experience of attack upon entrenchments. For this purpose he had been carefully saving up artillery ammunition by strictly limiting the amount to be expended in the routine of trench warfare, and he calculated that he would have sufficient at his disposal to allow him to engage in a considerable battle early in March. He entrusted the execution of this battle to Sir Douglas Haig's I. Army, which was directed to attack the German lines near Neuve Chapelle, an operation which it was hoped would result in a favourable position for the further battle which was to be undertaken later in coöperation with Foch. The battle of Neuve Chapelle opened on Mar. 10 with what was in those days held to be a very heavy bombardment. This bombardment was followed by an infantry assault, which was at first successful, and carried the village of Neuve Chapelle, but was soon brought to a standstill by the enemy's machine-guns. In this battle the British first experienced the difficulty of bringing up reserves at the right time through roads blocked by the débris of battle and over ground scarred by trenches and torn by shell-fire. On the whole, however, both the French and the British were impressed by the result of the bombardment, which was held to promise great things when there should be more guns and more ammunition. Preparations for further battles therefore went forward.

The Germans, guessing what was on foot, were not slow to interfere with these preparations. On April 17 a portion of Smith-Dorrien's II. Army attacked and gained a footing upon Hill 60, an important feature on the S. face of the Ypres salient. The Germans, counter-attacking, promptly regained possession of the hill and followed up this success by a far more serious enterprise on April 22. By then Foch's preparations for the attack on the Vimy Ridge were far advanced, and to obtain the troops he needed for the coming battle he had greatly weakened the French forces left in the N. portion of the Ypres salient. Against this portion the Germans launched waves of poison gas discharged from cylinders, which completely overwhelmed the French troops, who had no protection against this utterly unexpected barbarity. The flank of the 1st Canadian Div. was completely exposed, and for a short time a definite breach was created in the Allied line. Fortunately the Germans were unprepared for the extent of their success, and had not the troops at hand to take immediate advantage of it, while the gallantry of the 1st Canadian Div. and the 28th Div. held the enemy at bay until reinforcements could be brought up. The first complete British territorial division to arrive in France, the 46th North Midland Div., was fortunately in the neighbourhood, and these and other reinforcements, some contributed by Foch from the reserves he was holding in readiness for his battle, sufficed to save Ypres and to patch up a new line.

But the second battle of Ypres, if it did not give the Germans all the success they might have attained had they been ready to follow up the first success gained by the employment of a method of attack which no civilized nation had conceived to be possible in modern war, at least gained a great part of their purpose by weakening the forces and exhausting the meagre supply of ammunition which the Allies were accumulating for their projected battle.

That battle began on May 9 with an attack by the I. British Army under Sir Douglas Haig on either side of Fromelles, and an attack by the I. French Army, commanded by General d'Urbal but under the direction of Foch, on a much wider front which extended from the Scarpe to the N. of the Souchez. The British attack made very little progress and it was soon evident that the preliminary bombardment had not sufficed to destroy sufficiently the enemy's defences, or, what was of greater importance, to overcome his machine-guns. Sir John French, however, felt himself bound by his agreement with Joffre and Foch to keep the enemy occupied on his front as long as possible, and the battle of Fromelles became merged in the battle of Festubert by bringing the front of attack slightly S. into what it was hoped would prove more favourable ground. The experience of Festubert was, however, hardly more favourable than that of Fromelles, for again the German machine-gunners checked all real progress, while the lack of artillery ammunition became more and more felt. The situation was made more difficult in this latter respect by renewed German attacks in the Ypres salient upon the II. Army, now under the command of Sir Herbert Plumer. The situation of the British army in Flanders was somewhat eased by the arrival of five more divisions of territorials, followed by the first of the New Army divisions, the 9th, but it was lack of shell rather than lack of men which forced Sir John French to stop his attacks, and the battle of Festubert petered out on May 25.

Meanwhile, on the British right, Foch was making encouraging if slow and very costly progress. In the battle of Souchez the villages of Ablain St. Nazaire, Carency, Neuville St. Vaast and Thélus were carried by d'Urbal's men, who fought their way doggedly up the W. slopes of the Vimy Ridge. The French found the German machine-guns to be the chief obstacle to progress and the prime cause of casualties, particularly in the villages, in which the enemy's machine-gunners fought indomitably from cellar to cellar and in a certain elaborate series of works which became known to fame as the Labyrinth. The French had by this time embodied the flower of the manhood of the nation in their army, and the splendid gallantry with which Foch's regiments fought their way forward in the battle of Souchez, enduring tremendous losses but ever gaining ground, if only at the rate of a score or two of yards per day, towards the crest of the Vimy Ridge, was never surpassed in the whole long war. When the British ceased their attacks on May 25, Foch had made enough headway to encourage him to believe that he could gain the whole ridge, and he determined to continue the battle alone. But for this he wanted more troops, and an extension of the British front, which would set free Frenchmen, while both he and Joffre were fearful lest the New Army divisions preparing to leave England should be sent to the Dardanelles. The French commander-in-chief therefore wrote, at the end of May, a letter to Kitchener which contains the key to the developments of the following months. It ran as follows:—

> "The retreat of the Russian army, consequent upon the temporary failure of its offensive, will doubtless allow the Central Powers to withdraw, at least for a time, a certain number of army corps which they will be able to use on another front, but it is probable that the greater part of these will be required to meet the situation created by the entry of Italy into the war.[1] The situation of the Russians, who will be for some time to come unable to undertake a decisive offensive, and the difficulties of ground which the Italian

---

[1] The Italian troops crossed the frontier at midnight May 24–25.

theatre of war presents until the Italian armies are able to debouch into the plains, show clearly that the principal effort of the Allies must be made in France. The developments of Arras[1] have proved that it is tactically possible to break the German front, but that for success an even more powerful effort is required, and that it is necessary to attack simultaneously at a number of points. France has at the present time 2,200,000 men engaged on her N.E. front and has reached the limits of her man-power. She can maintain her armies at their actual figure but she cannot increase them. The solution of the problem is then in the hands of England. If she sends us her New Armies we shall be able to make not only an English and a French effort but an English effort and two French efforts simultaneously at the most favourable moment and with great power. The British forces, reinforced by the New Armies, will be given zones of operation proportionate with their strength. They will retain their present zone, extending it on both flanks to the N. of Ypres and to the S. of La Bassée canal, and they will take over the zone to the S. of Arras towards the Somme. They will thus lie on either side of the French X. Army, which will hold the front of attack which it has organized. The alternation of French and British troops has always given the best results. The principal effort of the English armies will be directed between the left of the French X. Army and the La Bassée canal and will extend to the N. of the canal; thus it will be linked up with the French attack in the neighbourhood of Arras.

"Of course, if the Germans are compelled to fall back before all the British forces are in line, their whole strength will be directed towards exploiting the success won in the direction of Antwerp and of Brussels. We owe it to ourselves and to our Allies to make a great effort now. It is therefore at the present time of the highest importance that the New British Armies should be dispatched as rapidly as possible and at dates and under conditions fixed beforehand, so that definite plans of operations may be drawn up in agreement by the two commanders-in-chief. I am firmly convinced that our action will be decisive, if it is combined and coördinated."

This letter shows that Joffre had not, at the end of May, much hope that Foch would capture the Vimy Ridge, but the latter's fiery spirit would not permit him to admit failure while the prize seemed to be within his grasp, and he persuaded the commander-in-chief to let him continue the battle. So the battle of Souchez, which had begun on May 9, dragged on until July 13. Twice Foch's men won their way to the crest of the ridge, only to be driven back, and at last Joffre called a halt and decided to prepare for the greater effort of which he had written to Kitchener. In that letter Joffre had indicated that he proposed to renew the attempts on the Arras front to take the Vimy Ridge, while the British army fought on the left of the French X. Army, but he had said nothing about the second French effort. This he designed to be the principal blow to be delivered in Champagne, to the E. of Reims. To obtain the French troops for this campaign he required the British army to extend its front to the right and left, and also to relieve de Castelnau's VI. Army on the Somme front. The remainder of the summer was occupied by these changes, which became possible as the New Army divisions arrived from England. The 2nd and 3rd of these reached France, disembarked at the end of May, and 6 more before the end of July, so that by then the 4 divisions and the cavalry division of Mons had in 11 months increased to 28 divisions and 5 cavalry divisions. These reinforcements enabled a British III. Army to be formed under Sir Charles Monro, which took over some 17 miles of front from a point to the S. of Arras as far as the Somme, eventually extending its lines to the S. of that river. Haig's I. Army prolonged its right S. of the La Bassée canal to the neighbourhood of Lens, and thus found itself facing the open plain of Loos, while Plumer's II. Army relieved the remaining French troops in the Ypres salient and brought its left into contact with the right of the Belgians.

While these movements were in progress, vast preparations were taking place on the battle-front. Guns, trench mortars, shells and military stores of all kinds had accumulated in hitherto undreamt-of quantities. Joffre and his staff had it in their minds at this time that they were engaged in operations in the nature of a huge siege, and that the essential was to blow a practicable breach in the enemy's lines through which the infantry could be poured to the assault. A study of the previous battles of trench warfare had convinced them that with sufficient guns and sufficient ammunition this was possible. The output of the French factories had been increased enormously, and though the British Ministry of Munitions had hardly yet begun to be productive, still the supply of heavy guns and shells for the British army had been greatly increased and it was equipped to reply effectively to the German gas. For these reasons the hopes which Joffre had expressed in his letter to Kitchener were very generally shared in the Allied armies. The one fly in the ointment was that there had been a renewal in the British Cabinet of the controversy between the "Easterners" and the "Westerners" and Mr. Churchill had pressed with all his eloquence and skill for a decisive campaign which should open the road to Constantinople. The result was a compromise, and three of the New Army divisions had gone to the East. Some compensation for this was obtained by the arrival of two more New Army divisions in France, and by the formation of a Guards' division, which had been made possible by the creation of new battalions of Guards and the replacement of those already in France by other battalions. This gave Sir John French an additional army corps, which he kept in his hands as a reserve.

Joffre opened his autumn campaign on Sept. 25. In addition to his great attack in Champagne, Foch with the French X. Army attempted once more to storm the Vimy Ridge, while Haig's I. Army attacked between the La Bassée canal and Lens, in conjunction with a secondary British attack to the N. of the canal and demonstrations on the front near Armentières. The general plan of the N. battle was that Foch, having carried the Vimy Ridge, should advance E. to the S. of Lens, while Haig pushed E. through Loos to the N. of Lens and joined hands with Foch beyond that town. In this way the Allies would avoid the mass of ruined buildings and miners' cottages which composed the town and would form admirable refuges for the German machine-gunners. The tactical methods to be employed on both the S. and N. battlefields were similar in conception, that is to say, there was to be a great rush forward of the assaulting infantry as soon as the attack had been adequately prepared by the artillery, and the reserves were to follow hard after the first-line troops. Only in the matter of the preparation of the attack was there any essential difference in the methods to be employed by the British and the French. The former had determined to replace an intense bombardment by a discharge of gas from cylinders similar to that from which they had suffered in the second battle of Ypres.

Of the British share in the general plan, the demonstrations in front of Armentières proved quite ineffective, while the attack N. of the La Bassée canal failed. On the front opposite Loos, however, the discharge of gas surprised the Germans and overcame the resistance of their first-line troops, though it caused some casualties among the British themselves and made it difficult to direct the attack. Despite this, the first wave of British infantry passed through and beyond Loos, when it appeared that they only needed the prompt arrival of the reserves to secure a very considerable success. Sir John French had, however, kept these back until he saw how the battle progressed, and when they arrived late in the evening the New Army division which formed two-thirds of the reserve found great difficulty in making their way through the confusion of the battlefield under conditions entirely strange to them, and were unable to confirm the first success won, so that, though Loos was held, German counter-attacks recovered a considerable part of the ground gained, and in particular the important Hill 70, which dominates Loos on the north. Worse still, Foch's attack on the Vimy Ridge failed almost completely and the Germans remained in possession of the crest. This alone condemned the N. attack to failure, for the British front of battle was not large enough to insure a breach in the enemy's defences sufficiently wide to be exploited successfully. The remainder of the battle of Loos, which lasted until Oct. 15, resolved itself into the repulse of a number of fierce German counter-attacks, which ended in mutual exhaustion, with the British in possession of the salient extending round Lens to the La Bassée canal.

The great battle in Champagne was an even more severe disappointment, because more had been expected. The first news from the field aroused high hopes. The first two German lines of defence were carried on a wide front, and many prisoners and guns were captured, while on the fourth day of the battle the third German line, which was believed to be the enemy's last system of defence, was for a time breached near Sainte Marie; but again the solution of the problem of bringing up reserves at the right time and in good order was not found, while the enemy's reserves, which came up fresh through country which had not been fought over, arrived in time to fill the breach. The battle of Champagne ran on into Nov., developing into a series of struggles for tactical points of importance, but ended with no material change in the position won by the French at the end of the fourth day of the battle.

---

[1] The battle of Souchez.

So the campaign of 1915 closed on the western front, with the Allies still asking themselves how it was possible to get through the trench barrier and drive the Germans from France and Belgium. The great bombardment followed by the assault in mass had failed, and some other method of attack was required.

Ere the year closed a new problem had developed in the Near East, which had its repercussion on the western front. German, Austrian and Bulgarian forces had overrun Serbia, and the Allied Governments had decided to send a relief expedition to Salonika. Part of the troops required for this new enterprise came from the Dardanelles, but more were needed and these had to be supplied from the western front. Five divisions of French troops under the command of General Sarrail were ordered off, and were accompanied by the three British divisions of the III. Army which had been holding the line S. of the Somme, the 27th, 28th, and 22nd. It was also decided to spare the two divisions of Indian infantry which had proved such a timely reinforcement at the time of the first battle of Ypres, the horrors of another winter of trench warfare in Flanders, and they were sent off to Mesopotamia. This reduction of the British army was made good by the arrival in France before the end of the year of the 2nd and 3rd Canadian Divs. and the 16th Irish Div., and of the 21st, 23rd, 24th, 25th, 26th, 36th and 38th New Army Divs., so that the strength of the British army in France and Belgium stood at 36 divisions and 5 cavalry divisions, a combatant strength of about 750,000 men. The Allies on the western front had therefore at this time about 3,100,000 men, opposed to 2,000,000 Germans. These figures gave rise to anxious discussion as to what superiority of numbers was necessary to ensure success under conditions of trench warfare, and whether and how the Allies could obtain the necessary superiority.

While these discussions were going on important changes took place in the Allied Command. Joffre had hitherto been nominally chief of the French General Staff. He was now definitely appointed commander-in-chief of the armies of the N.E., with de Castelnau as his chief-of-staff. In the British army Sir John French was brought home to command the troops in Great Britain and was succeeded by Sir Douglas Haig, with General Kiggell as his chief-of-staff, while Sir William Robertson, who had been chief-of-staff to French, became chief of the Imperial General Staff at the War Office.

Operations in 1916.—In Dec. 1915 the first serious attempts to obtain unity of action between the Allies took place, and a conference of commanders-in-chief and chiefs-of-staff of the British, French, Belgian, and Italian armies, attended also by representatives of the Russian and Japanese armies, was held at Joffre's headquarters. At this conference it was agreed to attack the enemy as early in 1916 as possible, sufficient time being allowed for the training of the New Army divisions that the British army was receiving, and for the reëquipment of the Russian armies. These plans, however, never matured, because the enemy anticipated them, and it is therefore unnecessary to refer to them further.

During Dec. 1915 and Jan. 1916 the Germans developed considerable activity along the front and made local attacks at Nieuport on the North Sea coast, against more than one point in the Ypres salient, at Givenchy on the Vimy Ridge front, on the Somme, and in Feb. on the Alsace front. The majority of these attacks took the form of experiments in various methods of bombardment which the Germans wished to test in view of a greater effort which they were planning. There had not been wanting signs that the enemy were preparing an attack on the Verdun sector; and considerable anxiety having been expressed as to the adequacy of the French defences on that part of the front, General de Castelnau was sent thither by Joffre, and he ordered certain improvements, but the time was lacking to give full effect to his recommendations (*see* VERDUN). In fact, the Allied defences at this period of the war were notably inferior to those of the Germans. The Allies had spent the greater part of 1915 either in carrying out the vast preparations necessary for an attack in trench warfare or in attacking, and had little energy or labour left for the elaboration of defences. The Germans on the other hand had been on the defensive throughout the year, and they enjoyed the great advantage of being able to employ upon their entrenchments forced labour from Belgium and the occupied provinces of France, and the large number of prisoners they had captured on the Russian front. Further, they had immediately behind their zone of battle the forests of Alsace and of the Ardennes, which provided them with an almost unlimited amount of timber. The Allies could only find labour either at the expense of the fighting troops or of the munition factories, and the British army was forced to import the greater part of the timber it required. It was not until much later in the war, when elaborate arrangements were made for the provision of native labour, and for the exploitation of the French forests, that conditions became at all equal in these respects.

It was the superior strength of their defences which enabled the Germans, while inferior in numbers on the whole front, to concentrate sufficient force for a great attack upon one part of that front. That attack opened on a front of nine miles on the banks of the Meuse opposite Verdun on Feb. 21, 5 German divisions attacking 2 French divisions. The enemy at once gained a startling success, penetrating the French defences, and on the fourth day of the battle capturing Fort Douaumont, one of the chief of the outlying works of the fortress of Verdun. This success was greater than any yet gained by the Allies in attack, though their relative superiority in men on the battle-fronts had been far greater than that of the Germans at the beginning of the battle of Verdun. The Germans won their successes mainly by the skilful handling of their medium and heavy guns, of which they had assembled a great number for the attack. They had before the war made a much closer study of the use of heavy and medium howitzers, both for field and siege warfare, than had either the British or the French, and they had numbers of gunners highly trained in their use, while careful experiments in bombardment, carried out before the battle, bore good fruit. It is to these causes that the tactical success won by the Germans in the first days of Verdun may be attributed. At Mons 5 German divisions had attacked 2 divisions of the British II. Corps, but the Germans had not had time to bring up their heavy artillery and at the end of a day's fighting had done little more than drive in the British outposts, while at Verdun, with the help of a mass of heavy guns, 5 German divisions had overcome 2 French divisions and gained such a position as menaced seriously the French fortress. The result was, therefore, a tactical victory for the German artillery.

Joffre dealt with the crisis promptly. De Castelnau was sent again to Verdun and arranged with Langle de Cary, who commanded the group of armies of the Centre, a command which included Verdun, as to the disposal of the reinforcements which were hurrying to the battle-field and as to the methods of defence. Joffre also sent with these reinforcements General Pétain, who arrived on Feb. 26 and assumed command in the battle-zone. The German attempts to gain ground beyond Douaumont were repulsed, and the French commander-in-chief had time to look round and survey the whole position. He had at once realized that the enemy was in deadly earnest. "*C'est la bataille,*" was one of his first remarks when he heard of the German attack. He had immediately requested Haig to relieve his X. Army on the Arras front, and had asked Kitchener to hasten the dispatch of British reinforcements to France. Two more New Army divisions and 1 Territorial division had reached France from England in January, while 3 more New Army divisions and 3 more Territorial divisions from England were to be in France before the end of May. The Dardanelles Expeditionary Force was being rapidly reorganized and refitted in Egypt by Sir A. Murray, and 2 British, 4 Australian, and 1 New Zealand divisions were expected to come from that country to the western front before the end of June. Haig had lost in Jan. one more division, which had gone to Salonika, but reinforcements would give him by the middle of the year an increase of no less than 15 divisions to his strength in Dec. 1915.

Both commanders-in-chief were agreed that the principles on which the plans of battle in 1915 had been drawn up required modification. It was seen that the analogy of the great siege did not hold, that something more was required than to blast a great breach in the enemy's lines and then to launch a great assault. The something more was the defeat of the enemy's reserves, which came up fresh and in good order to meet troops when the assault had been thrown into some confusion. It was agreed, therefore, that the first object of battle should be to draw in and exhaust the enemy's reserves, and that until that object had been achieved no decisive success could be expected. So long as the enemy continued to attack Verdun, it would, on this principle, be to the advantage of the French to endure these attacks provided always that the enemy gained no success which would affect seriously the strategical position on the whole front, and provided that the exhaustion of the French man-power was not excessive. Joffre therefore proposed to fight defensively at Verdun as long as possible, but to be ready to strike back as soon as the situation there appeared to him too dangerous, or as soon as the French army was approaching the limits of endurance. He therefore asked Haig not only to relieve the French X. Army but to prepare to attack N. of the Somme on a front as wide as the resources of the British army would permit, and undertook to support that attack with a French attack S. of the river on a scale which would depend upon the effect of the battle of Verdun upon the French army.

The Germans had at this time arrived at a very similar theory of battle. The chief of their General Staff, Falkenhayn, has said that he believed the strain of the war upon France to be such that a break might occur if the strain could be increased. This was not an unduly optimistic appreciation of the position if it be remembered that in the previous May Joffre had told Kitchener that France had then reached the limits of her capacity to expand her military forces. Materially Falkenhayn was not far wrong, but he understood the psychology of his enemies no better than other Germans, and he failed to appreciate the spirit of France. The maxim of Verdun—"*on ne passera pas*"—became for France an inspiration as potent as the influence of Jeanne d'Arc. The object of the Germans in the battle of Verdun was to bleed France white, while the object of the Allies during that period was to wear down the military power of Germany as the preparation for striking the *coup de grace.* So upon both sides the theory of the war of exhaustion developed.

During March, April and May the struggle for Verdun continued, the Germans in their several attacks gaining sufficient ground to encourage them to make a new effort now on the right bank of the Meuse, now on the left. During all this fighting the reputation of two of the defenders of Verdun increased steadily, and in May General Pétain succeeded to the command of the group of armies of the Centre, General Nivelle taking his place in command on the actual front of battle.

Between Jan. and July the British strength in bayonets and sabres grew from 450,000 to 660,000, and there was a more than corresponding increase in artillery and aircraft. This enabled Haig to fall in completely with Joffre's wishes, and as soon as the relief of the French X. Army was completed he set about preparing for the great attack on the front N. of the Somme. The growth of the armies made necessary the creation of a IV. Army under the command of Sir Henry Rawlinson. The III. Army was now commanded by Sir E. Allenby, and Sir Charles Monro, who had gone out to supervise the evacuation of the Dardanelles, returned to command the I. Army. British troops now held a continuous line from the Yser canal to the Somme, and were actively preparing to take upon themselves more of the brunt of the war on the western front, a burden of which nearly seven-eighths had hitherto fallen on their French comrades. This preparation entailed enormous labour, for it not only involved the accumulation of immense stores and piles of munitions of all kinds on the selected front of attack, the construction of miles of roads, railways and trenches and many other preliminaries of a great attack in trench warfare, but also the completion of the training of hitherto untried troops. The British army was, in fact, in process of becoming a national army. The old regulars were now little more than a small leaven of the whole lump, and though the new troops arrived in France with considerable knowledge of their duties as cavalrymen, infantrymen, gunners and airmen, they had had little opportunity of learning to work together as part of a great machine. The problem of training was the more complicated because of the great variety of new weapons and methods which had been developed since the outbreak of war; and to teach each part of the army the powers and limitations of every other part, and the whole to work together in combination, was a very heavy task. To this task Haig at once addressed himself, and formed behind the lines schools of instruction in every branch of trench and battle warfare, while careful arrangements were made for the training in attack of divisions when out of the line. All this busy work behind the lines did not mean any cessation of activity on the front, and during these months of preparation a long series of raids into the enemy's trenches were planned and executed, raids which gave the new troops valuable experience and kept the enemy on continual tenterhooks.

In the latter part of May the German Crown Prince redoubled his attacks on the Verdun front, and on the 21st the Germans stormed the Mort Homme hill on the left bank of the Meuse, for which they had been struggling for weeks. Pétain at once called Joffre's attention to the gravity of the situation, and pressed for an early beginning of the counter-offensive on the Somme, but Joffre was anxious to give Haig as much time as possible for the training of his troops, and made Pétain endure yet longer. Fire from the Mort Homme hill had long impeded German progress on the right bank of the Meuse, but with the hill in their possession the enemy in the beginning of June began to press hard on that bank and on the 7th captured Fort Vaux. Thereupon Pétain renewed his representation to Foch, who in consultation with Haig decided that the battle of the Somme should begin on July 1. The preliminary bombardment was begun a week earlier, on June 24, the day on which the Germans, after capturing Fort Thiaumont, stormed the village of Fleury and attained the farthest point in their progress towards Verdun. While this preliminary bombardment was in progress, a bombardment so intense that the guns could be heard in England, no less than 70 raids were carried on the British front between Ypres and the Somme, and gas was discharged into the enemy's lines from 40 different points. The troops which were about to attack the German trenches from Gommécourt to the Somme included the flower of British manhood, and no more splendid body of men has ever gone forward to battle. British aircraft had already gained the ascendancy over the enemy's airmen, and the British army was now well equipped with machine-guns, trench mortars, bombs, gas-projectors, and all other new appliances which experience of trench warfare had shown to be necessary; the tunnellers had proved themselves to be more than a match for the enemy's mines, and for the first time in the war there was a sufficiency of heavy and medium guns and an assurance of an adequate if not abundant supply of shells. Expectation therefore ran high.

The results of the first attack were a heavy disappointment. The main attack was delivered by Rawlinson's IV. Army between the Ancre and Maricourt, about a mile N. of the Somme, where they joined hands with the French VI. Army commanded by General Fayolle, who was to attack astride the river under the general direction of Foch. This main attack was combined with a subsidiary attack by the IV. Army N. of the Ancre, and yet another by the III. Army upon the Gommécourt salient. Upon July 1 both the subsidiary attacks and the whole left of the main British attack failed completely and with heavy loss, but the right of the main attack and the whole of the French attack made such good progress as to warrant the continuance of the battle. The British failures were in the main due to want of experience in the artillery. More than two-thirds of the British batteries engaged had been created since the outbreak of war, and at that time they did not possess sufficient ammunition to gain such practical experience in intense bombardment as the Germans had given their gunners before the battle of Verdun. The chalky soil of the Somme hills lent itself to the construction of deep dugouts, of which the enemy had a great number, and to prevent his men from coming out of these in time to meet the British infantry special and very accurate methods of artillery preparation were required. In default of these the infantry yet again found themselves checked on the greater part of the front by the deadly German machine-guns, and it was mainly through the devoted valour of the infantry through the first days of the battle that the gains made by the right of the IV. Army were confirmed and extended. The first successes won by Foch's men along the river itself were greater and were obtained at less cost, partly because the Germans, overrating the effect of the battle of Verdun, had not expected attack from that quarter, and partly because of the better preparation of the attack by the French artillery, the French having a far larger number than the British of trained gunners for the expansion of that arm. The lesson of the first days of this great battle is that the creation of new armies during the course of a war is an even more intricate and difficult business than had been imagined, even by those who, knowing some of the difficulties, had undertaken the creation of Kitchener's armies with devotion and enthusiasm.

One of the results of the events of the first days of the battle was that Sir Douglas Haig decided to divide his fighting front between two armies. He directed Rawlinson with the IV. Army to exploit the advantages won on the right, and formed on his left a V. Army under Sir Hubert Gough which was to keep the enemy busy on its front and act as a pivot to the IV. Army. The battle was fought out in three phases, the first being the struggle up the slopes from the valleys of the Ancre and of the Somme to the S. crest of the Somme plateau, the second the struggle for possession of the plateau, the third phase consisting of the advance down the N. slopes. The first phase was consummated by a brilliant night attack by the IV. Army on July 14, and on July 17, the British and French troops N. of the river were abreast of the French S. of the Somme, who had for some time been established opposite to Péronne. The whole front of attack could again move forward together. The second phase constituted a long series of fierce struggles, the Germans bringing up more and more troops and disputing every yard of ground, so it was not until Sept. 9 that the British, with the French on their right, were able to look down upon the N. slopes of the plateau and the plains beyond.

By this time two of the objects for which the battle had been fought were gained. The Germans, forced to transfer troops to the Somme, had to relax their pressure on Verdun. The French retook Fort Thiaumont on June 30, while throughout July they slowly regained part of the ground which had been won from them, and on Aug. 17 drove the enemy out of Fleury. Verdun was no longer in danger, and Pétain and Nivelle were able to plan at leisure counter-attacks on a more extensive scale. The second object of the battle of the Somme, the exhaustion of the enemy's reserves, was being obtained as surely. When the battle began, the front attacked by the British was held by 6 German divisions, that attacked by the French by two. In the 2 months 36 German divisions had been engaged on the British front, 18 on the French. In the 6 months of Verdun the Germans had employed 43 divisions in battle, so that their defence on the Somme was far more exhausting than their attacks at Verdun.

At the end of Aug. the failure of Falkenhayn's plans was publicly admitted by his supersession by Hindenburg, with Ludendorff as his chief assistant. The latter, after visiting the fields of Verdun and the Somme, found the German position on the western front to be one of great gravity, and the chief problem confronting him to be how to stop "the progressive falling off" of the German fighting power. The situation of the Allies had improved marvellously since June, when men were wondering how long it would be before the Germans entered Verdun. Not only had Verdun been saved and the Germans been forced to fight desperately on the defensive, but the Italians had driven back the attacking Austrians in the Alps and had then passed themselves to attack on the Isonzo. On the Russian front Brussilov had won great victories on the Bukovina, and Rumania had entered the war, too late certainly to profit by Brussilov's success, but none the less adding apparently another ally to those who confronted the Central Powers. The whole machinery of the Allies was, for the first time, simultaneously at work, and Joffre's strategy appeared to be triumphant.

It was in these encouraging circumstances that the third phase of the battle of the Somme began on Sept. 15. The attack of that day was made famous not only by the successes won, which were considerable, but by the fact that tanks then made their first appearance in battle. There has been much controversy as to the wisdom of this step (*see* Tanks). The experts have maintained that the value of this invention was discounted by premature use, that it should have been kept in reserve to surprise the enemy when large numbers of the new weapon were ready, and that it should have been first used on ground more favourable than a shell-torn battlefield. It was decided to employ tanks in the Somme battle for two reasons. Firstly, so much having been gained at great cost, the moment seemed to have come to press the enemy with every available means. The chief obstacle to the progress of the infantry continued to be the German machine-guns, and tanks were reputed to be the ideal means of overcoming machine-guns. If it would have been foolish not to have pressed the advantage won, it would have been criminal to have withheld from the sorely tried infantry the protection and aid which was at hand. The second reason was that experience was required in the use of tanks in battle. It was necessary to learn both how the tanks would comport themselves when put to the highest test, and how they would work in combination with infantry and artillery. The effective coöperation of infantry, tanks and artillery undoubtedly went a long way towards winning the war in 1918, but it is a legitimate belief that this coöperation would not have resulted unless experience had been gained in 1916.

Despite the employment of tanks, and despite the splendid valour of the infantry of the New Armies, the resistance of the enemy was not broken in the third phase of the battle of the Somme. The days were growing shorter and the weather became uncertain, while the enemy, drawing troops from all parts of the front to prevent his line from breaking, fought with fine courage. By Nov. 17, when rain and mud put an end to the battle, the Germans had engaged no less than 127 divisions. The enemy's reserves had indeed been worn down; in the valley of the Ancre he was hemmed by Gough's V. Army into an awkward salient, but the weather had broken and it was too late to reap the harvest on the battle-front. The first fruits of the Somme were garnered elsewhere.

On Oct. 24 Nivelle began an attack on the right bank of the Meuse, and on the following day recaptured Fort Douaumont. This conspicuous success was followed by the recapture of Fort Vaux on Nov. 2. The battle ended in a complete victory for the French, 6 French divisions overcoming 7 German divisions at surprisingly small cost. Nivelle and Mangin, who commanded the army corps engaged, became the heroes of France. The victory was largely due to the skilful handling of massed artillery, and the Nivelle method became famous. Its fame was extended when, on Dec. 14, a second attack won an even more brilliant success, which made Verdun quite secure and brought in 11,387 prisoners and 115 guns, again at small cost.

When the statesmen of Paris and London compared the results of these two battles at Verdun, which had resulted not only in important gains of ground but in the capture in a few days' fighting of more than 17,000 prisoners, with the slow bludgeon work of the Somme in which the British army in four and a half months had captured 38,000 Germans at a tremendous price, they began to think that they had at last discovered the man for whom they were looking so anxiously.

Operations in 1917.—On Nov. 11 1916 Joffre assembled his second conference of commanders-in-chief to consider plans for the following year. It was agreed that the Germans were in great difficulties on the western front, and that the situation of the Allies was more favourable than it had ever been. The fighting strength of the British army had grown to about 1,200,000 men, and it was known that considerable further reinforcements would reach France during the first few months of the year. The fighting strength of the French army had been increased by the incorporation of native troops to about 2,600,000, so that, including the Belgians, the Allies disposed of about 3,900,000 men against about 2,500,000 Germans.

Joffre declared that the French army could maintain its strength for one more great battle, but that thereafter it must progressively decline, as France had no longer a sufficient number of men of military age to replace losses. He therefore warned Sir Douglas Haig that during the coming year the burden must fall more and more upon the British army, a position which the British commander-in-chief readily accepted. Germany had recently created a number of new divisions, some of which had been employed against Rumania, but it appeared probable that the transfer of these divisions to the western front would be delayed if Russia was able to be active on the eastern front, and of this the great improvement in the supply of munitions for the Russian army held out promise at this time. It was also agreed that, in view of the probable decline in strength of the French army later in the year and the promised reinforcement of the British army, the relative superiority of the Allies on the western front would be greater in the spring of 1917 than at any time which could be foreseen with certainty. For all these reasons it was decided to take the earliest possible opportunity of pressing the advantage won by the battle of the Somme, and of continuing the process of exhausting the enemy's reserves as preparation for an effort which should be decisive. All the armies of the Entente were to be ready to attack in the first fortnight of Feb., the British army between the Vimy Ridge and Bapaume, the French armies between the Somme and the Oise; and the French attack was to be followed soon after by another in Champagne to the W. of Reims. It was further understood between Joffre and Haig that these attacks would, if necessary, be followed by further attacks by the British army in Flanders. During the winter the British army was to do its utmost to press the enemy on the Somme battlefield, and to prevent him from recovering from his embarrassment there.

The underlying ideas of this plan were primarily that the policy of exhausting the German reserves should be resumed at the earliest possible moment, and secondly that the utmost effort should be made to complete the work begun on the Somme. The commanders-in-chief believed the situation to be such that victory could be won in 1917, but they were under no illusion as to the possibility of ending the war by one great blow to be delivered in the spring. Joffre followed up the results of this conference by issuing general instructions embodying the decisions reached, and in these instructions he directed that the first British and French attacks, that is to say, those to be delivered between Vimy and Bapaume and between the Somme and the Oise, were to be ready by Feb. 1.

No sooner were Joffre's plans completed than a series of intrigues against the French commander-in-chief came to a head. A number of officers of the French General Staff regarded with dismay a proposal to give more and more of the task of consummating victory to the British army and less and less to the French army. They found many supporters among the politicians in Paris, and these were reinforced by others, who feared that the "war of exhaustion" and the process of wearing down the enemy's reserves would end in exhausting France before it exhausted Germany. The cry therefore went up that it was time to have a change in the Higher Command. Foch, whose bloody assaults upon the Vimy Ridge had not been forgotten, was held to be too much of a "hammer and tongs" fighter, and he was placed on half-pay, while the state of the defences of Verdun before the German attack began was brought up against Joffre. So he was given a marshal's baton and an honorific position in Paris, and Nivelle reigned in his stead.

The new commander-in-chief at once made a drastic change in Joffre's policy and plans. He proposed to increase the weight of the French attack; and in order that he might obtain the French troops necessary he proposed that the British should relieve the French VI. and XX. Armies and extend their front S. across the Somme as far as the Amiens–Roye road. In return he proposed that Haig should modify his plans for keeping up the pressure on the Germans on the Somme battlefield during the winter, and that the date of the combined attacks should be postponed until Mar. 15. This meant a delay of six weeks in launching the attacks planned by Joffre, and the enemy would be given time to recover from the effects of the Somme. But it became clear, as Nivelle's plans developed, that there was to be an even more complete change of plan than this. He proposed to apply on a great scale the methods he had employed with such success at Verdun, and to return to the policy which had been discarded after the failure in Champagne in 1915. He intended, by skilful employment of a great mass of artillery, to overcome the enemy's resistance in his front lines, and then to pour in to the assault a great reserve which should break through the trench barrier completely and so change the whole strategical position on the western front.

Early in Dec., 1916, there had been a change of Government in Great Britain, and Mr. Lloyd George had become Prime Minister. He had made up his mind that the Somme had been a costly failure, and was eagerly looking for some method of winning the war which should be speedier and less costly in life than that of a "war of exhaustion." He therefore welcomed a general who promised a short, sharp and decisive battle, which would be over, one way or the other, within a comparatively short time. So at a conference held at Calais at the end of Feb. 1917, it was agreed between the British and French Governments that the British army should be placed under the general direction of Nivelle for the forthcoming operations. This decision violated a fundamental principle of military organization. A general of division is not, while still in command of his division, placed also in command of an army corps which includes other divisions, for the good and sufficient reason that if his attention is absorbed by the details of one unit or of one part of the front, he cannot simultaneously give proper attention to the other units or to other parts of the front. The right course would have been to have given Nivelle the general charge of the whole western front and to have appointed another commander-in-chief for the French army. The results of this mistake soon became apparent. On the last day of the Calais Conference news arrived from the British V. Army that there were signs of a German withdrawal in the valley of the Ancre. Some time before, the British airmen had discovered that a great new system of defensive works had been constructed by the enemy covering Douai, Cambrai and St. Quentin, the system which became known to the Allies as the Hindenburg line; and not long after the report from the Ancre came in there were indications that the Germans were preparing to retire from the whole of the Somme battlefield into this line. But Nivelle, not being in close touch with happenings on the British front, did not believe in a German retreat, and issued to Haig orders which were not compatible with the changed situation, and in certain matters went far beyond the agreement reached in Calais. This led to friction, which was adjusted at a further conference in London. By then it had become apparent that the Germans were in retreat on the whole front between Arras and the Aisne near Vailly. The Germans, relieved from pressure on their front during the winter, had prepared for their retreat systematically and brutally. The whole country which had been in their occupation W. of the Hindenburg line was devastated, villages were burnt, roads and railways destroyed, fruit trees cut down and everything of any value was removed, and mines which exploded at a touch were prepared with diabolical ingenuity. In these circumstances a rapid pursuit became impossible, and the Germans were able to delay the advance of the Allies by rearguards, while they removed their heavy artillery and established their main bodies in the Hindenburg lines.

This manœuvre, planned and successfully carried through by Ludendorff, effected a great change in the situation to the benefit of the Germans. Not only did it materially shorten their front and thereby enable them to increase their reserves, but their troops exchanged the battered defences of the Somme battlefield with its awkward salients for the strongest lines which had yet been built upon the western front. Further, the enemy had withdrawn from a considerable part of the front which Nivelle had intended to attack, and this made necessary a further postponement of his battles, but he still adhered to the main features of his plan. In the altered circumstances grave doubts arose in the minds of some of the senior French generals as to the feasibility of this plan, and when these came to the ears of the French War Minister, M. Painlevé, he assembled a Council of War on April 6, on the very eve of the offensive, at which criticisms of the plan were presented by certain of the commanders who were to take a leading part in its execution. Nevertheless, the French Government decided not to interfere with Gen. Nivelle. It is difficult to conceive of a more unfortunate prelude to a great battle. However, these doubts and hesitations of the leaders were not known to the rank and file of the army or to the French people; and when, on April 9, the spring campaign began by an attack by Allenby's III. Army on the enemy's lines E. of Arras, and by the Canadian corps with one brigade of the 5th Div. on the Vimy Ridge, and met with an immediate success, hopes soared high. The French public was deeply impressed by the rapid capture of the Vimy Ridge, which had for so long resisted Foch's attacks, and great things were expected when the French army advanced.

The second of Nivelle's blows was delivered by the group of armies of the centre, now under Franchet d'Espérey, against the German front in the neighbourhood of St. Quentin; but Franchet d'Espérey was here in contact with a part of the main Hindenburg line, and he had neither the time nor the means to prepare effectively for an attack upon their formidable defences. The operations of the centre group of armies, which had been intended to be an important part of Nivelle's programme, dwindled therefore into little more than a demonstration, which took place on April 14 and had no material results. Nivelle's main battle, which took place on the front between Reims and Anizy, began on April 16. It had been planned that the assaulting troops should on the first day of battle break through the first three German lines. The attack was made by Mangin's VI. Army and Mazel's V. Army, with Duchesne's X. Army and a mass of cavalry in reserve ready to exploit their success. Antonine's IV. Army struck in to the E. of Reims on the 17th. The left of Mazel's attack failed almost entirely; and elsewhere, though the first German line was captured, little progress was made beyond it. The dream of a rapid rupture of the enemy's front had to be abandoned, and a fresh plan of battle had to be formed.

One of the first results of the failure of Nivelle to realize his hopes was that he had to request Haig to press his attacks to the E. of Arras with all possible vigour, so as to keep the largest possible number of Germans occupied in that quarter. This entailed a prolongation of the battle of Arras into a period when gains became small and were only purchased at great price. None the less Haig decided that the situation made it necessary to support the French with all his power, and he fought on till May 17, by which time the British front was established some 4 m. to the E. of Arras and in the plain to the E. of the Vimy Ridge. While Haig was thus battling in the N., Nivelle on the Aisne front had brought his X. Army into his front line, and by slow and bitter fighting had won his way up the Chemin des Dames ridge, of which he captured the eastern portion. Early in May it was quite evident that there was no prospect of such a break-through as had been planned, and on the 15th the French Government replaced Nivelle by General Pétain, while General Foch, recalled from semi-retirement, became chief of the staff in Paris. Pétain's first task was to wind up the operations on the Aisne front, and the battle ended definitely on May 20.

The spring campaign had proved a failure in comparison with what might have been, and still more in comparison with what Nivelle had promised, but its results were far from being insignificant. The German retreat in March, which was a direct consequence of the battle of the Somme, had at last brought about the attainment of one of the objects for which Joffre had been striving for so long. The Allies had now more elbow room on one of the most vital parts of their front, that which covered directly the roads to Amiens and Paris. Had the Germans in March 1918 started from the positions which they held in Feb. 1917, and had their attacks progressed at the same rate, they would have entered Amiens on the second day of the battle, which would have ended with the German guns bombarding Abbeville and communication between the French and British armies severed. It is therefore not too much to say that the retreat which was forced upon the Germans by the battle of the Somme saved the Allies in the following year. But how much greater might the results have been if the plan formed by Joffre and Haig in the previous Nov. had been followed—if the Germans had been pressed on the Somme battlefield during the winter, and if they had been attacked early in Feb. before their plans for retreat had been completed. Despite all the difficulties with which the successful conduct of that retreat by the Germans had confronted them, the Allied armies had in the battles of April and May captured 62,000 prisoners, 446 guns, and 1,000 machine-guns, and had gained positions of the first importance; 57 divisions had been compelled to fight upon the French front and 99 on the British front. Had Nivelle been content to follow Joffre's example, and to prepare methodically for the exhaustion of the German reserves without overtaxing the endurance of the sorely tried French army before attempting to break through the enemy's lines, he might have claimed a conspicuous success for his first campaign. But the hopes which he had roused had been extravagant, and the dejection when they were not realized was correspondingly great. The dejection was increased by the news of the Russian revolution, and by exaggerated reports of the losses in the Aisne battles; and it was hardly alleviated by America's entry into the war, for it was well understood that American troops could not be ready to take their places in the firing line during 1917. The immediate consequence of this dejection was the outbreak of a series of mutinies in the French armies, which so affected the *moral* of the French troops that Pétain found it necessary to appeal to Haig to keep the enemy engaged while he restored the confidence of his men.

If the attention of the Germans was to be occupied by the British armies it was necessary that they should be forced to fight. Upon any part of the British front S. of the point where it bends S. from the Belgian frontier N.W. of Lille it was possible for the Germans to repeat their manœuvre of March and avoid a battle by retiring into another system of defences, for in doing this they would be merely abandoning a portion of French territory which was of no great value to them, while they might by this method economize sufficient troops to enable them to fall upon the French. On the Belgian front they could not fall back without risking their hold upon the ports of Ostend and Zeebrugge, which were to them important bases for their submarine campaign, and without endangering the security of the chief aerodromes from which their air attacks upon England were made. For these reasons Haig decided to press the enemy with all his available means upon the Belgian front, and on June 7 he began this campaign with the battle of Messines. This battle was most skilfully and thoroughly prepared by Sir Herbert Plumer, and was fought and won by his II. Army. The battle began with the explosion of a number of huge mines, the secret of which had been preserved by constant and devoted watchfulness on the part of the miners, who had tunnelled beneath the enemy's lines many months previously and awaited patiently the opportunity for their use. The effect of these explosions, combined with a very skilfully planned bombardment of massed guns of all calibres, was such that, except in the right of the attack in the neighbourhood of Messines, the infantry, for once, had little to do. The whole of the Messines-Wytschaete ridge was captured at comparatively very light cost, and the Ypres salient, a name of ill omen for the British army since Oct. 1914, disappeared.

The strength of the British army in combatant troops was now at its greatest. Haig had 64 divisions and 10 cavalry divisions under his orders, and a mass of heavy artillery, tanks and aeroplanes. It was well that this was so, for the army was to be called upon to endure greatly while Pétain and his men got their second wind. Nor was it only the situation on the western front which called for resolute action, for the condition of the Russian army was far more critical than that of the French army. Kornilov had, on July 1, begun an offensive, and if he was supported and encouraged by success in the W. it was still possible that the Russians might continue to be a powerful factor in the war.

With these heavy responsibilities on his shoulders, Haig began on July 31 the second battle of Ypres, with a great attack by the V. Army, which had been moved N. for the purpose. This attack was combined with a subsidiary attack by the French IV. Army under General Antoine on the British left. The object was to gain possession of the Passchendaele ridge, so as to be able to sweep with gun-fire the plains beyond it toward Zeebrugge and Ostend. This achieved, a combined naval and military attack, which had been secretly prepared in England, was to be made on the Belgian coast, which it was hoped would gain possession of the ports and so relieve the British Admiralty of some of the many anxieties caused by the German "U." boats. In preparation for the landing the British took over from the French the lines on the Belgian coast near Nieuport and moved other troops up to the coast behind these lines. The position at Nieuport, which consisted of a narrow strip of ground, with the Yser at its back, was not easy to hold against determined attacks, and before the British preparations for defence were completed the Germans attacked and captured the lines E. of the river. This was an inauspicious beginning, but worse followed, for the weather broke immediately after the battle began and then followed a rainfall unprecedented for August.

The plan of battle was to deliver a series of blows, each with an objective limited by the support which the artillery could give without changing position. It was believed that the experience of Messines and of Verdun had shown that this would allow the infantry to reach their objective without heavy loss. Ludendorff, however, met this method of attack by a new method which he called the elastic system of defence. He made no attempt to hold his front lines in strength, but withdrew the bulk of his infantry from the zone which would be most heavily bombarded and relied mainly upon machine-guns in concrete "pill-boxes" to break up the British infantry attack, and upon counter-attacks by the troops whom he had held back. But it was less this method of defence than the mud of Flanders which prevented British progress. The opening battle of July 31 gave the British possession of the whole of the Pilken Ridge, of the German first line of defence between Nordshoote and Klein Zillebeke, a front of 10 m., and of most of the German second line, but it was not until Sept. 20 that the enemy's third line was penetrated, and not until Oct. 4 that the British were established on the high ground between Broodseinde and Becelaere. The difficulty of getting guns and ammunition forward through the slough of mud prevented the delivery of a rapid succession of blows, each with a limited objective, as had been planned, and in the event a more terrible strain was imposed upon the British troops than in any other battle of the war. As in the case of the battle of the Somme, the first fruits of the third battle of Ypres were reaped elsewhere than on the battle-front. The Germans, forced to send more and more troops into the fiery furnace which blazed in the Ypres ridges, were compelled to leave the French alone, and Pétain had time to restore the confidence of his army. Part of his method was the delivery of very carefully prepared attacks on a comparatively small front, supported by a great mass of artillery which should leave the infantry little more to do than to occupy the ground won. The first of these attacks was delivered by Guillaumat's II. Army on the Verdun front, and was completely successful, ending with the French in possession of all the ground which the Germans had won in 6 months fighting in 1916. This was followed by a more important attack delivered on Oct. 23 by Maitre's VI. Army, which gave the French the whole of the Chemin des Dames ridge, and resulted in the capture of 11,000 prisoners and 200 guns. Then and not till then Pétain expressed himself as satisfied that his immediate purpose was achieved.

The British troops, struggling in the mud of Flanders, could not be told the reasons which had called for a supreme effort from them, and the terrible struggle through the mud, unrelieved by any conspicuous success, was a heavy strain upon them. As events turned out it would probably have been wiser to have brought the third battle of Ypres to a close immediately after the French had won the Chemin des Dames, but at that time the British were within a short distance of the crest of the Passchendaele ridge, while information received at G.H.Q. showed that the strain upon the German army had been far greater and that there had been a very appreciable lowering of the *moral* of the German troops. Haig had yet another blow in preparation. The continued bad weather and the slowness of the progress had caused the abandonment of the project of landing on the Belgian coast, and all hope of driving the Germans from the Belgian ports had gone, but there still appeared to be an opportunity of profiting from the exhaustion of the German reserves before the winter gave them a period for recovery, as it had after the battle of the Somme. A final reason for continuing the struggle was that on Oct. 24 an Austro-German attack had been launched in Italy, and at Caporetto had broken through the Italian lines. It was therefore of importance to keep up the pressure upon the Germans on the western front. So the third battle of Ypres was continued, until the ridge and village of Passchendaele were captured on Nov. 3.

A fortnight later Byng's III. Army attacked the German front opposite Cambrai. This battle opened a new era in trench warfare. One of the outstanding difficulties which the trench barrier had created was that it had hitherto eliminated one of the chief resources of generalship, surprise. The time and labour required to prepare for a great bombardment, and the accumulation of the huge stores of material of war on the selected front of battle, made it impossible to conceal intentions from the enemy. But at Cambrai these difficulties were overcome by using a great number of tanks, brought up secretly to take the place of the bombardment in breaking the enemy's defences. The attack was made upon one of the strongest parts of the Hindenburg system, but the tanks successfully broke through, and the surprise was complete. At Messines the guns had left nothing for the tanks to do, and in the third battle of Ypres they had been defeated by the mud of Flanders, but at Cambrai they came into their own. One thing alone was lacking as far as their part in the battle went. The coöperation between the tanks and the artillery in the later stages of the attack was not complete, so that numbers of tanks fell easy victims to the German guns, a lesson of which advantage was taken in 1918. Of greater importance was the fact that 6 French and 5 British divisions had been transferred to Italy to help the Italian army to stem the disaster of Caporetto, so that Haig had not the troops to complete and extend the first successes won at Cambrai. It is a typical illustration of the advantage which their central position conferred upon the Germans that several of the British divisions which would have been invaluable at Cambrai had not reached the Italian front at the time when the Austro-Germans were checked on the Piave and the battle of Caporetto came to an end. So the German counter-attacks won back a good part of the ground which Byng had gained in the first advance, and the battle of Cambrai ended on Dec. 7 in one more disappointment for the Allies.

The campaign of 1917 on the western front had been fatally hampered by the change of plan which had been made by

Nivelle when he succeeded Joffre. That change had permitted Ludendorff to prepare for and carry through the retreat into the Hindenburg line, and had postponed the date of the Allied offensive from Feb. 1, the date fixed by Joffre, until April 9—a delay of nine precious weeks. As Joffre, had anticipated, it had been necessary for the British army to bear the brunt of the fighting, but it would have done so under very different conditions if the Germans had been hustled back into the Hindenburg line, as they were in Sept. 1918, and if Messines had been fought at the beginning of April, and the third battle of Ypres had begun on May 30 instead of July 31. The battle of Cambrai might then have synchronized with the last offensive of the Russian army, and the combined effect might well have been such as to have saved that army from dissolution, for adequate French and British reserves would have been available in France to support Byng's attack, and the war might have ended victoriously in the autumn of 1917. As it was, the battles of 1917 showed clearly that the solution of the problems of trench warfare at which Haig and Joffre had arrived was correct. It was first necessary to exhaust the German reserves and then to strike a surprise blow or series of surprise blows. Cambrai had shown how surprise might be achieved. But all this experience, which had been purchased at great cost, had been acquired too late to be put to profit in 1917, owing to the fatal delay in opening the campaign of that year. The collapse of Russia was definite and complete, and the Germans were transferring their divisions from E. to W. as rapidly as their railways could carry them. The French divisions had since the middle of the year been gradually reduced in strength, as France had no longer the men to replace the losses in the ranks, and now Pétain found himself compelled to cut down the number of his divisions. The British army was not receiving from home the men to fill the gaps caused by the bloody fighting of Passchendaele; and Haig, early in 1918, was compelled to follow the example of the French and reduce the strength of his divisions, while 11 British and French divisions had been removed to Italy. True, American troops had reached France, but it was improbable that they would be able to take their place in the line of battle before the middle of the summer. In April 1917 there were in France and Belgium 64 British, 108 French and 6 Belgian divisions, or 178 in all, opposed to 128 German divisions. At the end of the year there were 59 British, 98 French and 6 Belgian divisions, a total of 163, opposed to 175 German divisions. Further, the British and French divisions were considerably weaker at the end of the year than they had been at the beginning, though this was offset, to some extent, by a corresponding reduction in the size of the German divisions. Most important of all, there were still large German reinforcements, which might amount to as many as 40 divisions, and did, in fact, amount to 32, ready to come across from the Russian front. The Allies could only obtain reinforcements in the shape of formed divisions by withdrawing troops from Palestine and Salonika, and to this their statesmen were opposed. So fate decreed that at the very time when the Allies had at last found out how to breach the trench barrier, they were thrown willy-nilly on the defensive, and had to prepare to meet the greatest effort which Germany had yet made in the west. (F. B. M.)

III. GERMAN OFFENSIVE, 1918

The military situation of the Central Powers at the end of the year 1917 and the beginning of 1918 has been thus described by Ludendorff in his *Memories of the War:*—

> "Throughout the latter half of 1917 I had strained every nerve to bring about the results that had now been attained, sparing myself no more than I spared others. The western front had held, the Italian army was defeated and the Austro-Hungarian armies in Italy were inspired with new courage. The Macedonian front was holding out. In the east the armistice negotiations were finished and the way to peace lay open to the diplomatists. Negotiations at Brest Litovsk were to begin about Christmas. There was a prospect of our winning the war. Only in Asia Minor had there been any hitch, but the great events in Europe had pushed them into the background."

Under the influence of this hopeful outlook the German Supreme Command decided in favour of a decisive battle in the western theatre of war in the spring of 1918. This decision was justified in the first place by the collapse of Russia. Fortune had favoured the Central Powers there, apart from their own military successes. Yet these might be regarded by them as having made good fortune deserved. The problem of a "war on many fronts" had been clearly comprehended, and the principle of first completing the work that had to be done in the east had been consistently maintained. But the fortunes of war are seldom all on one side—as Hindenburg and Ludendorff were to discover. The peace negotiations in the spring of 1918 dragged on so long in Trotsky's hands that not only did a new appeal to arms, though a brief one, become necessary, but the final result was merely an "armed peace." This involved keeping strong German forces tied up in the east to secure the treaty and profit by it, and prevented the best use being made of these forces in the decisive battle of the war on French soil. But the fact remains that the chief presupposition—indeed, the indispensable one—on which the Supreme Command founded their project was the breaking up of the enemy in the east. By the end of March 44 divisions had gone to the west, followed in April and May by 15 other divisions, among which were 3 of cavalry.

It was a question of considerable importance whether, and to what extent, the participation of the Austro-Hungarian forces in the coming decisive battle would be possible. The Italian army, though not destroyed by the short autumn campaign of 1917, had been so thoroughly beaten, and was so unstrung morally, that it might reasonably be neglected as a military factor for the next few months. The offensive there had also had the important result of drawing off 11 French and English divisions from the French theatre of war to Italy. The duration of Italy's collapse was, of course, uncertain. It would presumably end automatically when the Central Powers dropped their menacing attitude. All the more was it important to maintain this. But it was not considered necessary to keep German fighting forces in the Italian theatre of war to this end. The *moral* of the Austro-Hungarian army had risen so markedly since the success of the last offensive that it seemed equal to carrying out this task without German support. The 6 German divisions in Italy were accordingly withdrawn during the winter, and were in the French theatre of war by the end of March. The German Supreme Command would have liked to use the Austro-Hungarian army to still greater advantage in the general scheme by bringing over a number of good fighting divisions and some heavy artillery to take a direct part in the forthcoming battles in France. This had been agreed upon in principle at a conference between Ludendorff and General von Arz on Nov. 3. The matter was further discussed in writing up to the beginning of Jan. 1918. But in the meantime other influences were at work, opposing the designs of the two Supreme Commands. According to Gen. von Arz the Austrian Emperor and Empress were averse to sending Austrian troops to fight on French soil against the French; and the non-German nations of the Austro-Hungarian Monarchy, supported by the Social Democrats, were strongly opposed to taking part in the war in the west. The German Supreme Command, on being informed of this, sent Gen. von Cramon, their representative with the Austro-Hungarian army in the beginning of 1918, "a definite order to insist upon a binding declaration." Arz replied that no Austro-Hungarian divisions would be available until peace had been concluded with Russia and Rumania, but that artillery could be sent, though it would be deficient in munitions. This offer was accepted.[1] General von Cramon succeeded in persuading Hindenburg and Ludendorff, in spite of the doubts which these proceedings had aroused in them, to make another request for the coöperation of Austro-Hungarian divisions in the western theatre of war. But Cramon's intervention with General von Arz in the meantime did not succeed. General von Arz explained to him in the end in strict confidence that it would not be agreeable to those in high places if infantry were sent to the west. As a last resource now the German Supreme Command tried to stir up its ally to an attack in Italy. On March 15

---

[1] Von Cramon, *Unser Oesterreichisch-Ungarischer Verbündeter* p. 6. The number of heavy batteries sent was 46.

Hindenburg implored General von Arz to arrange for an immediate offensive by the Austro-Hungarian armies in Italy, to relieve the German army in its difficult decisive battle. After some hesitation Arz replied on March 27 that he would rally all the means at his disposal and deliver a blow against Italy at the end of May which should completely break her.

Germany was thus left to carry out the decisive battle on French soil on her own resources. There were three enemies to be reckoned with: England, France and America. The British had borne the chief burden of the fighting during the latter half of 1917, when the great battle in Flanders had towered over all other events in significance. In spite of the lost ground in the Ypres sector, and the unavoidably heavy loss in fighting power, it could in the end be registered as a German victory in so far as the English had failed to achieve their strategic aim, the destruction of the German submarine base in Flanders. For the estimation of future prospects, at least as important as this happy issue was the apparent failure of the British attack system—with its unreserved employment of masses in a battle of *matériel*, and its methodical conduct of the offensive as a series of thoroughly prepared attacks with objectives limited in space and, once chosen, rigidly adhered to. It was believed that this system revealed a lack of capacity for operative manœuvring inherent in British leadership and in the British army. The tank battle at Cambrai in Nov. was looked upon as a further proof of this. Should the Germans succeed in bringing about a war of movement again in the west, their conviction was that they would prove themselves superior to the British.

Contrasted with the powerful effort that the British had put forth to gain the victory in Flanders, the ends for which their French allies were striving in the second half of 1917, after the failure of the great Aisne offensive, were apparently more modest. The local attacks to which they confined themselves at Verdun and later in the Laffaux corner turned out favourably for them, it is true, and inflicted considerable losses on the Germans. But on the whole their cautious strategy led to the deduction that the moral depression of the French nation and the army, which had set in after the battle of the Aisne, and was not hidden from the Germans, had not been overcome. Not that the German Command was likely to regard the spirit of France as permanently paralysed; on the contrary it was considered certain that the French army, in the following spring, would enter the struggle for final victory completely refreshed and stronger than before. In comparison with England she was the militarily stronger opponent, more skilled in strategy and tactics, and more dangerous.

When it had to be decided upon which of the two the German blow was next to fall, a success over the British therefore suggested itself as being more easily and certainly obtainable. Added to this there was the consideration—decisive from a political standpoint—that the principal enemy, England, would probably be more inclined for peace when she herself had suffered a crushing defeat. In this respect the estimated value of the respective opponents had altered considerably from that made by Falkenhayn, which had passed muster two years earlier. The war in which England was fighting with her own forces on the European continent was, since the battle of the Somme, no longer a "side show." She was, on the contrary, now conducting it with all her available forces, with the utmost tenacity and with her own weapons. For the rest it might be assumed that when the German "hammer blow" fell on the one enemy, the other would not stand idly looking on, but would either directly assist his ally or proceed to a relief offensive. One hammer blow would not suffice. A general battle was therefore launched. Ludendorff dwelt on this in making his report to the Kaiser on Feb. 13 1918 at Schloss Homburg, when he said:—

> "The battle in the west which the year 1918 will bring presents the biggest military problem ever set before an army. France and England have grappled with it in vain for 2 years. . . . It must not be imagined that we are going to have another such offensive as in Galicia or Italy. It will be a stupendous struggle, beginning in one place and continuing in another, and will take up a long time."

As regards the relative strengths of the two sides, the German High Command cherished no illusions as to any marked numerical superiority for their own forces. The strength of the German army in the west was brought up to 194 divisions by the addition of divisions brought up from the eastern and Italian theatres. The Entente forces in France in Feb. 1918 were estimated at 167 divisions. If the 11 French-English divisions in Italy, which were easily available, were added to these, there remained only a slight superiority in the number of divisions on the German side. In artillery the German western army was not even quite as strong as its opponents. Ludendorff based his decision on the theory that the totals of the two fighting forces would balance each other. A factor which counted for much with the Germans was the physical condition of the army. An offensive attack best suited the character of the nation and the tradition and training of the troops. It was the more powerful form of warfare. Germany owed to it all her previous tangible successes. The ordinary citizen could see, through all his heartfelt longing for peace, that his efforts could only be rewarded when Germany had overthrown her enemies. Here and there, it is true, the same disintegrating influences which were undermining the war spirit at home could be seen at work in the army. But the influence of the good elements, which far outweighed the rest, stamped the whole as an excellent body of men. Their "will to win" was not indeed inspired purely by victory for its own sake. The attack was longed for also as a deliverance from the terrible battering which they had endured for years with resignation and with courage.

It now became supremely important to find out the precise moment at which the American forces would actively intervene. In a review of the situation drawn up by the German Supreme Command in the winter of 1917–8 it was stated:—

> "The United States are forming an army of about 50 divisions, of which three only have as yet landed in France. One of these is at the front to be trained. The two others are in need of more training behind the front. By the spring of 1918 the American forces in France may reach a strength of about 15 divisions. The mass of the divisions will only be suitable for use on quiet fronts. Only the 3 divisions now in France may be expected to take part in a spring offensive. The corps of officers is not yet trained for war on a large scale. On these grounds the independent use of large American units in difficult positions will be out of the question at present. The drafting of reserves and the arming and equipment of the American troops are good. Training is still inadequate. But the first regiment put in at the front fought well during a German attack, and it is therefore to be expected that the American soldier, after more training and experience, will prove himself a worthy opponent."

In another calculation, made in Dec. 1917, the Supreme Command estimated the whole of the American forces that had been landed in France up to the spring at 450,000 men at most. A larger number was not to be expected on account of the lack of shipping for transport. The mass of this army could not be ready for an attack by the spring of 1918. The value of the Americans at first would therefore lie in their power to set free English-French divisions on quiet fronts. As a matter of fact this calculation of the American strength was too generous. The total number of Americans landed in France up to the end of March 1918 has been stated by the American Secretary of War at just under 370,000. Of these only 144,000 were included in the 5 fighting divisions. The fact that the Germans did not at once realize the full extent of the increase in American transports, from April onward, in response to the urgent demands of England and France, does not actually affect their review of the situation at the end of 1917 and the beginning of 1918. When Hindenburg and Ludendorff resolved on the decisive attack they were entitled to hope for so crushing a victory over the English and the French by beginning operations early that the palm of victory could not be snatched from them again even by very considerable masses of American troops, whose intervention would only become effective in the later war of movement. Supposing—as a basis for the actual starting-point of the offensive—the Germans to be in possession of the line Doullens–Amiens by the beginning of April, which was within the realm of possibility, the annihilation of the British army might be completed within that month. Meanwhile the battle against the French would have broken out in full force. During the months of May and June a decisive defeat had to be inflicted on them also. If that succeeded, the

Americans—whose troops were for the most part not yet sufficiently trained for a war of movement—would merely be swept into the general debacle. Entirely inexperienced in the leading of great masses, they would hardly change the decrees of fate.

The Germans had of course to take into account the fact that even a complete military victory by the Central Powers in 1918 on the continent would not end the war, so long as the will of Lloyd George in England was unbroken. Again, should the Entente by a great effort succeed in readjusting the situation on the continent, the war of starvation could be carried on with greater effect in proportion as the submarine menace diminished. The question was therefore whether the Central Powers, after subduing their enemies on the continent of Europe, could still hold out economically. The opening of the Ukraine had come so late that it was extremely doubtful whether its resources would be available in time to stave off the threatened economic collapse of the nations of the Quadruple Alliance. Ludendorff had no illusions upon this point, being convinced that it was absolutely essential to have his military offensive in the west accompanied and supported simultaneously by a political offensive on a large scale on the English home front. This would be directed toward bringing about the fall of Lloyd George and persuading the English nation to accept rather Lord Lansdowne's efforts in the direction of peace. It was for the political leaders to call into being and carry out a propaganda offensive of this nature. The commander-in-chief could only demand it—and this he did.

As early as the middle of Jan. 1918, Ludendorff had handed in to the Imperial Chancellor, with a strong personal recommendation, a memorandum for a German political offensive drawn up by Colonel von Haeften. But this urgent warning to the political leaders of the State met with no response. The politicians were unmoved. Once more, on June 3 1918, Ludendorff made another passionate appeal to the Chancellor to undertake a political offensive against the English home front, again sending a memorandum by Colonel von Haeften, which this time included a detailed plan of campaign. But it was unavailing.

The question arises here whether the German Supreme Command would not have done better, at a moment when they were militarily strong, to attempt their utmost to induce the political heads of State to prepare the way for peace. Ludendorff's published memoirs show that it was never opposed to efforts aiming at an honourable peace that would safeguard the existence of the German Empire. But all the attempts in this direction made by the political leaders found the Allied Governments unresponsive, and were regarded merely as signs of internal weakening in the Central Powers. Ludendorff was to see for himself, shortly before the beginning of the great spring offensive, how little the attitude of the Entente statesmen had changed and how hopeless and damaging the renewal of any such attempt would prove. According to a credible report from a neutral country, Washington's readiness to enter into official peace negotiations depended upon the following preliminary conditions: the unconditional evacuation of northern France and Belgium; the payment of reconstruction expenses; Alsace and Lorraine to be made independent; the annulling of the treaty of Brest Litovsk, just concluded in the east; reference of all eastern questions to a peace conference to be summoned by the Entente; and a complete change of the Government system in Germany on lines to be laid down and enforced by President Wilson later. A commander-in-chief who, in the spring of 1918, should have pressed the political leaders to pave the way for peace negotiations under such conditions, without having tried for a decision on the field, would have been cursed by his fatherland.

Plan for a Break-through at St. Quentin.—Suggestions for an offensive had been made by the higher command of Prince Rupprecht of Bavaria's army group after the English offensive in Flanders had died down in the beginning of Nov. 1917. The suggestions culminated in the proposal to launch the main attack from the Armentières–La Bassée front in the direction of Hazebrouck against the right flank and rear of the British, on the assumption that they would certainly concentrate their forces in Flanders in the coming spring for a renewed break-through operation in the direction of the German submarine base. The Allies would then obviously be in a difficult operative position. The mass of their fighting forces would be crowded up on the extreme N. wing of the whole western front. To bring up strategic reserves would take time. On their left flank and rear lay the sea. For the British in particular, strategically less trained as they were, it would not be easy to deploy their closely packed masses in the direction of the right flank and to cover their threatened communications, all the more so as a large part of their non-mobile fighting material was rigidly fixed. Tactically the prospect of breaking through the front was a good one, since the attackers would be faced by few positions technically very strong. It was, however, recognized that the country would be a difficult one in which to follow up the attack, which would be hemmed in between two commanding ranges of hills, and still further confined to the left by the La Bassée canal. It would therefore have to advance mainly in the wet Lys depression, and the ascent to the Bailleul and Hazebrouck heights would have to be carried by fighting. On account of the wet ground the operation would probably have to wait until the middle of April. General Ludendorff fully acknowledged the advantages of the proposed operation, but laid stress on the serious difficulties presented by the ground, and above all on the point that the attack, being dependent on the weather, could not be made early enough. He considered that an attack in the region of St. Quentin offered better prospects. When the line of the Somme–Péronne–Ham had been captured, the attack could proceed in a N.W. direction, resting its flank on the Somme, and might succeed in rolling up the British front. The higher command of Crown Prince Rupprecht's army group held to its own point of view, however, that the attack on the line Armentières–La Bassée in the direction of Hazebrouck—code name "St. George"—was to be preferred on tactical and strategical grounds to any other offensive setting in farther to the south. Their reasons were thus stated in a memorandum of Nov. 20:—

> "In consideration of the general political situation and the appearance on the scene of the Americans, the attack should clearly be made as soon as possible. On the other hand a decisive effect can only be attained if the objective, *i.e.* the mass of the British army, is securely united in massed groups in Flanders. This condition of security can only exist when the British in Flanders are preparing to attack. Our offensive can only set in when this has become a certainty. The British *must* attack in Flanders again in the coming year. They are forced to do so by our submarine base. We may therefore count on it with certainty and make a strategic use of the situation. Side by side with these considerations arises that of the difficult nature of the ground in the Lys depression, which makes it imperative *not to attack too early*. From previous experience and observation it would appear that considerable difficulty may be expected with the ground and the water up to about the middle of April. . . . The British in Flanders have similar ground conditions to consider. If *they* proceed to the offensive, *our* attack at Armentières–Estaires would presumably be possible also. We should do best therefore—both as regards the operative effect and the state of the ground—to wait until the British attack in Flanders. It will then be necessary at first for us to give way before the enemy offensive in Flanders and—so far as possible—on the French front also. If we accept the defensive battle, we shall have to tie up such strong forces in the process that we shall not be powerful enough for an attack. We can without hesitation afford to retire as far as the line Vladsloe–W. of Roselare–Werwicq, as the submarine base will still be covered."

Opposition was also raised in some quarters to an attack from the La Bassée canal front to the corner of Bullecourt, on the ground that it would come up against a strongly fortified system, and that no rapid result at the start could be expected. The enemy would, it might be assumed, gain time for bringing up his reserves from the north and the south. "Unless the circumstances change considerably in our favour there is a danger of the operations resulting in a pocket being formed in the front and not in a decision in the war of movement."

The idea of an attack delivered from the II. Army's front—code name "Michael"—was criticized as follows by the higher command of Prince Rupprecht's army group:—

> "Decisive operations by the II. Army can only aim at a break-through of the enemy front and the attainment of the best possible results in the war of movement against the enemy's reserves. The

Somme—an unusually powerful obstacle—will serve as a support for the left flank. The main idea of an operation on the II. Army front must therefore be to break through the enemy front in the first place, in order to protect the left flank against the French and roll up the enemy front toward the north. The operation would then be continued in the area between the Somme and the Pas de Calais against the enemy forces there, as a war of movement with a N.W. direction. The enemy would have his back to the sea. There would be a prospect of a decisive victory if the operation were pushed far enough forward. The progress of the operation in detail after the successful break-through would depend upon the measures taken by the enemy, and cannot be foreseen. Operations of this order presuppose strong forces, considerably stronger than would be necessary for the "St. George" scheme. The advantages of this scheme are that in the II. Army area operations are possible at all seasons; that the enemy positions—excepting those S. of St. Quentin—are not strongly built up and are but thinly occupied at the moment; that the question of strong enemy reserves need hardly be considered, as the British will make their attack in Flanders, and the French are not likely to make theirs against the II. Army. If the French should prepare an attack at St. Quentin, the German attack would have to set in farther to the north. The disadvantages are that the operations would lead through the ruined tract of country 'Alberich,'[1] and would involve crossing the wide area of the Somme battle, strewn with positions and craters; that the II. Army front runs from N.W. to S.E., while the direction desired for the main operation is N.W. It therefore becomes considerably more difficult to roll up the enemy front towards the N.W. after the successful break-through.

"The attack would first have to be made in a W. direction as far as the Somme, and could only later develop toward the N.W. A certain amount of time would necessarily be wasted before the operation of movement came into swing. This would give the enemy an opportunity of bringing up his reserves, the network of railways being favourable for the purpose."

Although General Ludendorff and the chief of the general staff of Rupprecht's group of armies, General von Kuhl, were agreed on the main point that the offensive should be directed against the British, the chief of the general staff of the German Crown Prince's army group, Count von der Schulenburg, held at first a directly opposite view, considering an attack on the French to be the better policy. "England, with her dogged self-confidence," he said, "is not likely to end the war on account of a partial defeat of her army. She will be more inclined for peace when the power of the French is broken by a heavy defeat." Count Schulenburg's proposal was "to attack in the Argonne and to the E. of it, and simultaneously to carry out a strong attack from the St. Mihiel region in a W. direction. The objective of the attack would be Verdun, and, if possible, the destruction of the portion of the French army enveloped by the attack. The wooded, indistinct character of the deployment area would make it easier to hide the preparations for attack. The attacks would have a good chance of success if managed as a surprise. The French would never get over the loss of Verdun. If the seizure of the fortress were combined with a decisive victory over a portion of the French army, which would mean depriving the French of the possibility of a really promising offensive in 1918, the French nation and its army would be swept by a great wave of depression:—

"The British are certain to attack in Flanders if we attack the French at Verdun. A French offensive may be predicted with equal certainty if the British are attacked. If the Supreme Command is not in a position to execute a big attack, and at the same moment fight a defensive battle in another place, there remains the possibility of evading the enemy attack on the threatened front by retreating. This could be carried out by the VII., I. and III. Armies, and also to a limited extent in Flanders presumably, but not E. of the Argonne or on the V. Army's front."

The armistice concluded with Russia on Dec. 15 made a considerable difference in the general situation. Russia no longer counted as a military factor, and the balance of power in the western theatre of war had now readjusted itself in favour of the Germans in consequence. All the reports received pointed to the conclusion that the Entente Powers would for the present limit themselves to a strategic defence, and would refrain from a great offensive until strong American forces became available. This was all the more probable because the effect of the submarine war so far could not apparently be considered so successful as to force Great Britain to undertake the destruction of the German submarine base in Flanders at an early date. This change in the situation removed the principal presupposition on which Gen. von Kuhl's proposed offensive at Armentières–La Bassée in the direction of Hazebrouck was based. The close massing of the British main forces in Flanders in the coming spring could not be relied on. It was far more likely that the Allies would distribute their reserves behind the front and place them in readiness round important railway junctions. It could not be denied that the operative conditions for a break-through in the St. Quentin region might also be unfavourably affected. The possibility of a French relief offensive had still to be faced.

In these circumstances Ludendorff refrained from laying down any definite direction for the attack against the British for the time being, reserving his decision until he could see how the situation developed. On one point only did he insist—the moment of the offensive must be fixed as early as possible on account of the Americans. With this in view the Supreme Command issued an order on Dec. 27 1917 for the preparation of several attacks on different parts of the front. The preparations were to be pushed forward so as to be complete by the end of March.

Count Schulenburg's original proposal—an enveloping operation at Verdun—had not yet been rejected, but was for the present only to be treated as a rough draft, the German Crown Prince's group using it as a foundation for an offensive from Champagne and the W. of Verdun on Clermont, and Duke Albrecht's group for an attack over the Meuse, S. of Verdun (code name "Castor and Pollux").

On one point the Supreme Command was now quite clear. The offensive must not take the form of a battle of *matériel*, such as the Allies had over and over again attempted, invariably without results. German aims would not be furthered by an offensive which condemned the forces to months of strain. The break-through must be made to lead up to a decisive operation in the open field. This could only be done if the enemy's trench system were overrun so rapidly that the reserves he had brought up could not arrive in time to intercept the blow behind the dinted-in front. A prompt and complete success was only conceivable at the moment of the surprise. This could only be attained by observing the strictest secrecy with the troops concerned in the attacks. Each army must be convinced that the attack which it was preparing was intended to be the one actually selected. To this end all preparations for attack, in respect of laying out communications, shelters, aerodromes, etc., were to be spread over the whole army front as far as possible. The placing of the troops in readiness was to come later, and was to be undertaken outside the selected battlefield by various large groups which could be quickly and secretly formed up for deployment in different directions by train and by night marches. Another feature was to be the deception of the enemy, who was to be perplexed by the semblance of an attack on the whole army front (artillery registration and so forth), by partial actions with limited objectives, and by feints of great attacks in other places. All the attack preparations were to be carefully observed on the ground and from the air, to see that they were not attracting attention. Although it might be impossible to prevent the enemy from discovering the direction of the attack in time, it might reasonably be hoped to keep him in uncertainty as to the movement and the scope of the attack, and the form which it was to take. Success therefore depended very considerably on the most rapid execution of the attack itself.

On Jan. 24 the Supreme Command decided which of the attacks should be carried out. The choice fell on the "Michael" operation in the zone of the XVII., II. and XVIII. Armies. At the same time the XVIII. Army was ordered to be transferred to the German Crown Prince's group of armies with the Omignon brook for its northern boundary.

In preparing for the Michael attack, the XVIII. Army's direction was to the N.E. of Bapaume, the II. Army's to the N. of the Omignon brook, and the XVIII. Army's to the S. of the Omignon brook on both sides of St. Quentin. The XVII. Army was to prepare a simultaneous attack S. of the Scarpe (code name "Mars South"), and the VII. Army another S. of the Oise across the front of the Crépy group (code name "Archangel"). The Michael operation was to take place about March 20, the Mars South and Archangel attacks a few days later after the regrouping of the necessary artillery and mine-throwers. The aim of the Michael attack was to be a break-through of the enemy front as far as the Somme on the line Ham–Péronne, and an advance, in conjunction with the Mars attack, on the right back of the Somme through Péronne–Arras. The Archangel attack had merely to make a diversion, and try to seize the heights E. of the Oise-Aisne canal.

---

[1] "Alberich" was the code name for the destruction of the ground surrendered on retreat to the Siegfried positions in the spring of 1917.

The Supreme Command also gave instructions that preparations for the attack over the Lys depression at Armentières–Estaire (St. George I.) and towards the Ypres salient (St. George II.) by the VI. and IV. Armies were to be pushed forward so as to be completed by the beginning of April. The idea of an enveloping attack at Verdun ("Castor and Pollux") was allowed to drop, as the chief of the general staff of army detachment C. had held out only very moderate hopes of success for an offensive S. of Verdun across the Meuse. On the other hand, in the event of a great French attack in Champagne, there was some thought of letting the III. Army fall back within certain limits, while the I. Army delivered a flanking counter-attack.

Ludendorff thus held fast to his plan of directing his offensive blow against the British. In choosing the Michael instead of the St. George operation, he was influenced chiefly by the fact that it would be independent of seasons and weather conditions and could therefore be carried out earlier. The tactical attack would, moreover, fall on a particularly weak spot in the enemy's front.

The idea of a diversion on a large scale, to take place either before or simultaneously with the Michael operation, was abandoned, as it seemed necessary to use all the available forces for carrying out successfully the one great blow as planned. On the other hand the Supreme Command arranged for deceptive measures to be taken at various points on the armies' front, *e.g.* a lively artillery battle on the St. George and Archangel fronts; partial actions on the I. and III. Armies' fronts, particularly at Verdun; a long-range artillery battle on the Lorraine front. These commenced in some cases in the beginning of March, and were continued in the days immediately preceding the battle and until after it was well started.

On March 10 Hindenburg sent out a definite order fixing the morning of March 21 for the attack. According to this order the centre of gravity of the operations lay in the XVII. and II. Armies both at the beginning and during the later development. After achieving the first great tactical aim—the cutting off of the British in the Cambrai sector, the offensive was to be carried N. of the Omignon brook in the direction of Albert–Arras and beyond, where the British front was to be dislocated by the VI. Army. The XVIII. Army was only required to cover the left flank S. of the Omignon brook, and to this end to take possession of the Somme and of the Crozat canal. Its deeply echeloned right wing could be extended northward to Péronne in case of necessity. An additional order from the German Crown Prince's army group in the meantime paved the way for the idea of a new move by the XVIII. Army by contemplating the possibility of its advance over the Somme and the Crozat canal. General von Hutier, commanding the XVIII. Army, at once grasped this idea—it had probably occurred to him before—and, in a document handed in to the army group on March 15, proposed as the XVIII. Army's task "as soon as the Somme and the Crozat canal had been crossed, to draw upon itself the French reserves designed for the support of the British and beat them, and to break the communications between the British and the French. . . . The sooner the army reached the line Chaulnes–Roye, the more chance would it have of meeting the French while they were still deploying, and the better the prospect of bringing about the war of movement." The Higher Command of the army group passed on the proposal with the additional note: "the more the French counter-offensive spends itself on Rupprecht's army group, the more effectually will the proposed operation hit the French. The enemy will be quick to recognize its decisive meaning and the threat to his capital. We may, therefore, expect a very strong resistance, and on that account the operation must be launched by powerful forces."

Ludendorff's attitude toward this proposal is not known. It would appear from a conversation over the telephone with General von Kuhl on March 20 that he had already weighed the possibility of accommodating himself to the idea if circumstances so shaped themselves, since he now intimated his intention of fixing the centre of gravity for the advance of the XVII. Army in the direction of St. Pol, and that of the II. Army in the direction of Doullens–Amiens—in case the XVIII. Army should meet with strong French opposition on the line Bray–Noyon if not earlier.

The peace training of the German General Staff was based on the strategic and tactical principles of its former chief of many years' standing, Count Schlieffen. Although a declared champion of the Cannae idea, the Count had also definitely accepted the break-through in his reflexions and teachings, though only under the conditions of a war of movement. In choosing the spot for the break-through Count Schlieffen considered the tactical weak spot within the enemy's lines to be of the first importance as a clue. At the same time there must be the possibility of following up a successful assault and break-through by an operation in a useful direction. He therefore considered a simultaneous attack against the whole enemy front to be the best means of breaking through, as by this their forces would be tied up, the reserves engaged and the shifting of troops to another place prevented.

When Ludendorff in 1918 was faced with the problem of the break-through, it was *not* under the conditions of a war of movement. The outward appearance of the war had fundamentally changed in the war of positions which had lasted for years. The defence was established along the whole front in a modern field position constructed according to a technique based on experience. The German attacking force was therefore confronted everywhere with the task of overcoming the opposition of the enemy in its tactically strong positions. For this he needed—at whatever point the break-through was attempted—the means employed in siege warfare, in particular a large quantity of heavy artillery and flame-throwers. For all that, however, the enemy positions were not everywhere equal in their tactical power of resistance. The ground, constructional work, density of occupation, formation of reserves, and value of the defence troops, showed many points of difference, and admitted of the sorting out of strong and weaker portions of the front. Ludendorff formed his decision quite in the spirit of Schlieffen's teaching. He, too, spied out the enemy's weakness. For the choice of the English front the leading political motive was probably primarily responsible, but the decision also happened to be in agreement with the military considerations. For although the British and French troops, in respect of their power of resistance, in tactical defence might be assessed at equal value, the British were inferior to the French in the skilled handling of masses, in the art of defensive battle and in power of strategic manœuvre. The weak points within the 140-m. British front in question, Armentières–La Bassée and St. Quentin, had undergone an exhaustive critical examination by the Higher Command of Rupprecht's army group. If Ludendorff decided to attack at St. Quentin it was because he would be hitting the enemy at his weakest point.

Military critics have raised the objection that Ludendorff let himself be swayed too much by tactical considerations and neglected the demands of strategy, seeing his own task from the very beginning only as a battering performance, consisting of a succession of independent hammer-blows. There is nothing to support such views. Rather is it evident that Ludendorff, here as always, was basing his strategy on the prospect of a promising tactical battle in complete accordance with the Schlieffen ideas. The attack delivered from Lens in the direction of St. Pol, as recommended by the French Gen. Buat, was extremely difficult tactically and did not offer any guarantee of a prompt initial success. But on this everything depended. Moreover, Ludendorff, in placing the attack where he did, had had visions of one great definite strategic aim, to break through the front of the

British army on its S. wing, cut it off from the French, and by pressing on its right flank and attacking it from the front cause it to waver and fall to pieces and force it back to the coast. What was that but a "Cannae operation," in which a natural obstacle—the sea—took the place of Hasdrubal? A second natural obstacle—the Somme—was to serve the German left wing, advancing in deeply echeloned formation, as a protection against a French flank attack. The difficulties presented by the unavoidable traversing of the ruined Alberich area, and the Somme battlefield with its craters, were fully recognized, particularly as regards shelter and the bringing up of fresh drafts. These difficulties would diminish, however, as soon as the operation reached out into the country as yet untouched by battle, to the W. of this zone. Only in case that did not succeed would the disadvantages of this wilderness as a permanent stopping-place become evident.

On one point indeed, and that the most vital, did Ludendorff's procedure differ from Schlieffen's form of strategy. The German attack was directed, not against the whole enemy front, but against a limited section only. The perfectly obvious reason for this was that the fighting forces and battle requirements came nowhere near being sufficient for such an undertaking. The question is, whether it would have been possible and desirable to carry out the Schlieffen idea in a general sense, if not literally. The aim of the attack on the whole front was to engage all the enemy's forces, particularly his reserves, who might otherwise in due course intercept and choke off the break-through, just as it became ripe for operative development. Ludendorff saw the danger of this quite clearly, and sought to avert it by feint attacks on as many parts of the front as possible, by threats of a great attack and by partial actions on a small scale. These measures undoubtedly had a great temporary effect. Pétain refused to send more than 3 divisions to Haig's hard-pressed front on March 24, on the ground that Ludendorff's main attack was to be at Reims, where the artillery battle had already begun. But the effect of these measures lasted only a short time, of course, and were limited as to material. The enemy's reserves were not absorbed, but could still, though after much delay, be moved and brought up to the decisive battlefield. It would certainly have been more in accordance with the Schlieffen idea if, alongside of these feint attacks and reaching beyond them, a serious diversion had been undertaken shortly *before* the main attack began. It would have had to be carried out by a strong but strictly limited number of troops, to give promise of a prompt initial success and to have a limited objective. For this purpose, so far as the British front was concerned the "St. George" operations across the Lys depression were not possible, on account of the season and weather conditions. In Flanders the circumstances were similar. There remained only the VI. Army front between the La Bassée canal and Arras. It may be questioned whether the attack, which was tactically very difficult here, would have succeeded to a sufficient extent in its object of tying up the strong enemy reserves. There were, in any case, important reasons for the decision not to make a preliminary diversion at this point in order to have a more powerful force to put in to the decisive battle itself.

On the French front things were essentially different. It was of the utmost importance that if the proposed operation were to succeed it should be secured from a strong flank attack by the French, and not be brought to a standstill by a relief offensive on a large scale. It is known that Ludendorff had intended the VII. Army to execute a diversion. But this was to take place *after* the great offensive had begun, and could not therefore have the effect of drawing off strong reserves of the enemy in a wrong direction and holding them fast there. The diversion would also be too closely in touch with the main attack as regards space. Several places had been proposed for a German diversion on the French front, such as the Chemin des Dames region and Champagne. Verdun was less suitable on account of the large force that would be required. The front of Duke Albrecht's army group in Alsace (Breuschtal) also seemed suitable. If the attack were made there the French reserves would be far away from the critical point of the coming decisive battle.

As far as the actual number of good attack divisions was concerned there were ample forces available. The spring offensive opened on March 21 with 62 divisions. Up to the close on April 5, 92 divisions had been put in, and even so not all the divisions available for attack purposes had been used up. This powerful mass would probably have been even more effective if it had not been used exclusively and directly for the break-through operation itself, but had been devoted in part to putting the French reserves into fetters at another place. General Buat even goes so far as to say that only by a series of diversions, delivered simultaneously or in rapid succession in different places, could the operative success of the break-through have been guaranteed. He admits however—and herein lies the point of the decision—that this method was impracticable for Ludendorff owing to lack of sufficient forces. For it was a question not only of having in readiness the required number of divisions but the massing of artillery, flame-throwers, airmen, munitions, motor columns and numerous other necessities of war. Of these the Supreme Command had not enough available for the furnishing of a powerful diversion immediately before or at the time of the main attack, if this was delivered on the scale planned. A diversion was therefore only conceivable in the event of a reduction of area or material in the main attack. But any reduction of this sort would have lessened the chance of a great and rapid victory on the spot selected, the indispensable condition of the undertaking.

The conclusions are that not only was the application of Schlieffen's theoretical ideal form for an operative break-through—the attack on the whole front—out of the question for Ludendorff, but the attempt to conform to the underlying idea in a modified form by executing a diversion on a large scale was not to be recommended in the spring of 1918, since the forces were insufficient. In practice the disciple was forced by existing circumstances to fall short of the master's theoretical standard laid down in time of peace.

But is it, as Buat thinks, the fact that the idea of the operative break-through was foredoomed to failure? Strategy is a system of makeshifts. This fundamental saying of Moltke's was fully appreciated by Count Schlieffen. Ludendorff had to act in accordance with it. If the enemy's reserves could not be tied up in another place and kept away from the scene of the main battle, and if, therefore, they might be expected to turn up there sooner or later, the work of the battle and the execution of the operative scheme would certainly be made more difficult. Whether the attacker, in spite of this, would have the strength to achieve not only a tactical victory, but the complete strategical success, which involved the destruction of the enemy, was the supreme question which only the god of battles himself could answer. If the reward due to his passionate efforts was withheld, he would have to moderate those efforts and reconcile himself to closing down the offensive and accepting the battle of *matériel* and its attendant overstraining of his forces. The first great hammer-blow would then at least have had the effect of a diversion. It would have accomplished its aim according to the Schlieffen idea of operations by shattering and absorbing a large portion of the enemy fighting forces. It was then for the command to show its skill in launching, as quickly as possible, a new attack to bring about a decision with the yet unused forces from another well-selected and prepared position.

This then was the problem of the break-through as it presented itself to the German Supreme Command.

The Great Battle.—As the Germans had not the means for equipping all the divisions on the western front equally, and as the essential value of the different divisions also varied for reasons connected with drafting, they were forced to limit themselves to a certain number of those which seemed most suitable for the purpose of the attack. These were the so-called mobile divisions. Altogether 52 of these divisions were made available for the beginning of the Michael operation. Besides these there were 10 divisions in the line directly taking a part in the attack, making in all 62 divisions. They were distributed as follows: XVII. Army, 15 mobile divisions and 2 divisions in the line; II. Army, 15 mobile divisions and 3 divisions in the line; XVIII.

Army, 19 mobile divisions and 5 divisions in the line. The Supreme Command had kept 3 mobile divisions for the time being at its own direct disposal. These were brought up to the region of Douai shortly before the beginning of the offensive so as to be more readily available for carrying out the Mars attack, for which they were originally intended.

The bringing up of the attack formations that were destined at once for the offensive began at the end of Feb. and was completed according to plan. On March 10 the bringing up of munitions began. During the last few nights the artillery, flame-throwers and divisions were formed up for deployment. On the morning of March 21 came the attack, delivered simultaneously by all three armies on the whole front—over 47 m. wide—from Croisilles to La Fère. It came as a surprise to the British III. and V. Armies. Contrary to the expectations cherished, the offensive made less progress in the first days in the case of the XVII. Army and the right wing of the II. Army than on the left wing of the II. Army and particularly in the case of the XVIII. Army, on account of the powerful British resistance. The cutting-off of the Cambrai salient failed because of the enemy's timely evacuation. In consequence of this the Supreme Command on the afternoon of March 22 ordered the XVII. Army to extend the success of the II. Army by an attack aimed particularly in the direction of Bapaume, and to prepare for the attack on both sides of the Scarpe (Mars) with strong forces to the N. of it.

When it became evident, on the morning of March 23, that the XVIII. Army and the left wing of the II. Army were advancing unchecked towards the W. and would in all probability reach their nearest objective, the Somme, on that very day, an order was issued for continuing the operation, as soon as the line Bapaume–Péronne–Ham should have been won. "The XVII. Army will attack with strong pressure in the directions Arras–St. Pol, the left wing in the direction of Miraumont. The II. Army will take the direction Miraumont–Lihons; the XVIII. Army will take the direction Chaulnes–Noyon and will send strong advanced troops through Ham." The three divisions held in reserve were now given to the XVII. Army.

Through this order the whole operation was pushed a long way to the left. The XVIII. Army, which was originally to have extended its front northward to Péronne on reaching the Somme, thereby releasing forces from the II. Army to carry on the attack N. of the river, had now instead to cross the Somme and advance its right wing in a slightly S.W. direction toward Chaulnes. There were thus portions of the II. Army left S. of the Somme as well as the XVIII. Army. The Somme was therefore no longer used as a support against a French flank attack, for the offensive now took a N. direction along the whole front, N. and S. of the river, with the operative aim of separating British and French.

This most fateful decision of March 23 arose from the tactical consideration of exploiting the XVIII. Army's comparatively easy success to the benefit of the general battle situation, by making a rapid forward push. Had the XVIII. Army stopped at the Somme and the Crozat canal, as was originally intended, extending with its right wing only northward to Péronne, its fine initial success would have had no effect on the advance of the attack farther to the N., which had up till then not quite come up to expectation. If, on the other hand, it had carried its attack across the Somme and the canal toward the W., in conjunction with the S. wing of the II. Army, the enemy, who was still holding out against the XVII. Army and the N. wing of the II. Army, would have been threatened on his right flank. From the strategical standpoint the decision was even more difficult and more vital. The fundamental idea of the Michael operation had from the first always been that of beating the British and the British only. The French were only to be held off from intervention by flank action. To this end the whole of the XVII. and II. Armies were to find a field for operations to the N. of the Somme. The reinforcements sent by the Supreme Command were also to follow in this direction, being mainly disposed in échelon in rear of the II. Army's left wing for the purpose of taking over the flank protection down the Somme from Péronne. At a later stage there were probably some portions of the XVIII. Army similarly engaged N. of the Somme. This whole strategical idea would have fallen to pieces if the strong natural obstacle of the Somme had been relinquished as a support at this point. It was clear that the left wing of the armies, entrusted with the offensive solution of its task on the far side of the Somme and the canal, would very soon not only draw upon itself considerable enemy forces, but would gradually have to prepare for a counter-offensive steadily increasing in strength. It had therefore to be reinforced from the reserves, which thus, as well as a portion of the II. Army, were no longer available for use in the direction followed by the main operation. But despite these apparent disadvantages the decision must be approved from the strategical standpoint also. The position of the XVII. Army and the north wing of the II. Army, as it was on the morning of March 23, made it doubtful whether the strong enemy resistance here could be broken in time to arrive at operations in the open field at all before the arrival of enemy reinforcements. There was a danger that not only the British but the French might throw strong forces on to the battlefield N. of the Somme, and so block the break-through in or close behind the British trench system. This was made easier by the contact with the positions E. of Arras, which had been maintained. The Somme—at Péronne or farther to the W.—would then serve the defender just as well for a safe support as the attacker had hoped it would serve him. It would also form an excellent obstacle for the front farther on up to Ham. As the direct intervention of the French, according to the way in which things turned out, had to be reckoned with, everything depended on hindering them from carrying it out systematically. The French must be caught up into the whirlpool of destruction. But this could only be done by forcing their Bray–Noyon front and attacking impetuously in the open.

In the days that followed Gen. Ludendorff held stubbornly to his operative aim of separating the British and French. The distribution of the reserves that had been brought up later was organized accordingly. The centre of gravity of the XVII. Army's advance, originally directed toward St. Pol, was now, on March 24, shifted more to the S. toward Doullens. The course of the battle on the whole front, up to March 25 inclusive, justified the expectation of achieving its ambitious aim. As the XVII. Army had pushed its way through the whole system of enemy positions and had advanced with its S. wing to beyond the Ancre, it too began to operate in the open field. The situation was now such as to warrant the attempt to dislodge the enemy front, both at Arras and farther to the N., by frontal attacks; and the Mars attack on both sides of the Scarpe was fixed for March 28.

The first faint doubts as to the possibility of carrying out the main operation to its full extent might have been aroused by the experiences of the XVII. Army on March 26. Its S. wing, on which everything depended, gained very little ground beyond the Ancre. As, however, in the meantime the II. Army's right wing had achieved the difficult crossing at Albert, there was hope that the XVII. Army's advance would also quickly get into its stride again. On all the rest of the front the brilliant progress of the offensive so far, particularly the impetuous forward push of the II. Army in the direction of Amiens and that of the XVIII. Army toward Montdidier, raised expectations of a continuation full of promise. Ludendorff proposed to bring about the separation of his opponents by a gradual concentration of the II. and XVIII. Armies against the French, and to this end the Somme below and at Amiens had to be reached and also the Avre. But the far-reaching aims of the Supreme Command were not to be realized. On March 27 the XVII. Army's offensive came to a standstill, and the next day brought the failure of the Mars attack on both sides of the Scarpe. At this point, therefore, the operation against the British was finally abandoned. Ludendorff decided to attack their front as soon as possible in a different place, and ordered the immediate preparation of an attack on the VI. Army's right wing on the Lys front in the direction of Hazebrouck. It would, however, probably be 8 or 10 days before this could begin. Otherwise the continuation of the Michael operation, as it had turned out, seemed to promise success only in the direction where there was still movement, that is, on the S. wing of the II. Army and with the XVIII. Army. As the intervention of the French so far gave the impression of being precipitated, it was concluded that the opponent had not yet fully organized his forces. The point was to keep him from doing so now. The coöperation of the II. Army's N. wing, now held fast on the Ancre, in the forward wheel toward the Somme below Amiens, could indeed no longer be counted upon. It seemed, therefore, all the more urgent to get possession of Amiens, the strategically important railway junction, by the quickest means, and also to cross the Avre. The centre of gravity of the offensive was therefore laid exclusively on the inner wings of the II. and XVIII. Armies in the next few days, all reserves being switched off in that direction. However, no real progress could now be made in the direction of Amiens. A last attempt on April 4 broke down before the enemy resistance, which had visibly increased.

The close of the Great Battle left the Germans in possession of a narrow salient stretching far out toward Amiens. This position had its dangers, which necessitated perpetual watching, and kept strong forces tied to the spot. On April 24 the II. Army tried to improve its positions between the Somme and the Avre by a partial attack, which after a passing success at Villers-Bretonneux ended in a recoil. After this for a long time no important battle actions took place on this section of the front.

The Michael operation had not achieved the full operative success, but had nevertheless dealt the British a heavy blow and crippled their fighting power for a long time to come. More than 40 British divisions were seriously affected, and also about 20 divisions of the French army which had been drawn in.

In the light of subsequent criticism, the question arises whether General Ludendorff's leading idea would not have had more chance of being realized if the decision of March 26 had limited the objectives aimed at in one direction or the other. Persistence in the double intention of dividing the opponents and simultaneously dislodging the British at and N. of Arras by frontal shock had the effect of dissipating the still available attack energy of the reserves, and made it impossible to focus on a single object the largest possible part of the forces still capable of a great effort. In view of the general outlook the only limitation worth considering was one which would have facilitated the progress of the Michael operation by temporarily renouncing the Mars attack and the proposed frontal attacks farther N. which went with it. The danger then would have been that the British, not being threatened from the front, would throw all their available reserves on to the battle-field as it now stood, and also release forces from their front for the same purpose. It would be the task of the XVII. Army and the portion of the II. Army fighting on the Ancre to continue their attacks and so draw these forces upon themselves, preventing a flanking attack against the German main operation in the direction of Amiens. It was for the moment less important to gain much ground in the direction of Doullens, provided that the decisive blow on Amiens on both sides of the Somme were kept going. Supposing that the 5 divisions which had been put into the attack on both sides of the Scarpe had been used in the continuation of the Michael operation with the XVII. Army and on the right wing of the II. Army from March 27 on, it would have been possible by this time to shift a number of reserves toward the S. to the decisive wing. A portion of these reserves did gradually find their way to the wing S. of the Somme a few days later, together with a number of divisions which had been engaged in the previous fighting. But they arrived too late, and the offensive had meanwhile come to a standstill. The conclusion is that events might have shaped themselves more favourably, from an operative standpoint, if the decision of March 26 had limited itself to the separation idea, laying increased stress on this at the cost of the intention to break up the whole British front at the same time.

Finally, there is no doubt that the Germans, by their last attempt to get possession of Amiens, put too great a strain on their available forces. However strong the grounds for this, it should have been of supreme importance to the Germans to avoid the wearing effect on their fighting force of a battle of material. This would have been easier to accomplish if a decision had been made by the end of March to close down the Michael operation. Instead, the attack on April 4 placed the inner wings of the II. and XVIII. Armies in the salient over against Amiens on both sides of the Avre in so difficult a fighting position that, whatever the result, the reserve strength which was still coming in had to be committed and was used up.

German Attacks—April, May, and June.—Closely connected with the Michael offensive, which came to a standstill on April 5, was the VII. Army's Archangel attack which followed. Between April 6–8 the right wing of this army threw back the enemy from its positions S. of the Oise through Amigny and Coucy le Château to beyond the Ailette. The ground gained made an improvement in the difficult rearward communications of the XVIII. Army's left wing. Following immediately upon this came the resumption of the great operations by the Georgette attack on the Lys front. General Ludendorff had had this attack in view since the end of March, and had prepared it at first as a diversion only. When it became clear in the beginning of April that the Michael offensive would not lead to a complete operative success, the Georgette attack was extended in its scope and aims to an operation for forcing a decision. It was proposed to break through the British–Portuguese front in the direction of Hazebrouck–St. Omer and then to continue the operation through St. Omer–Béthune and as far to the S. as possible. The VI. Army was to attack on the front Armentières and the La Bassée canal with its centre of gravity on Hazebrouck; the left wing at first only to wheel in on the general line Aire–Béthune–La Bassée canal; the centre to push through toward Hazebrouck and the heights W. of it and to seize the canal crossings between St. Omer and Aire; the right wing to take possession of the commanding heights to the E. and S. of Godewaersvelde and then to take the direction of the barrier of heights at Cassel. The IV. Army, attacking one day later from the line Hollebeke–Frelinghem, was to attach itself with a strong left wing. Armentières was to fall by envelopment. Beyond all these there was a proposal for the IV. Army to attack in Flanders from the Houthoulst Forest in the direction of Poperinghe, with the object of cutting off the Ypres salient.

The enemy's situation seemed favourable to the Germans. The British had hardly any more fresh reserves to draw on, so that the only reserve to be considered consisted of divisions worn out by fighting. The Portuguese stationed on the Lys were not credited with any great power of resistance.

Seventeen divisions from the VI. Army and 4 from the IV. Army were placed in readiness, and the necessary artillery was brought up, some of it being obtained by regrouping from the Michael front. In the course of the operation 14 more divisions, mostly from the zones of the XVII. and II. Armies, were put in.

The attack by the VI. Army, beginning on April 9, took the opponent at first by surprise. On this same day the whole stretch of the Lys at Sailly was conquered. But the battles of the next few days, though successful, were obstinate and costly, and already it appeared doubtful whether the attack would develop into a break-through. The left wing had not succeeded in taking Festubert and Givenchy or in reaching the canal. On the other hand there could be no question of stopping the offensive immediately, as the inner wings of the VI. and IV. Armies were still fighting in a difficult tactical position. Their position improved, however, with the seizure of the Neuve Église and Bailleul heights, but in general the gains of ground were only local. The advantages of the initial surprise were forfeited and the opponent found time to organize his resistance more and more thoroughly. The hope of being able to set the interrupted operation in motion again by a surprise assault on the Belgian front, delivered by the IV. Army from the Houthoulst Forest, vanished when it became known on April 16 that the enemy was eluding the carefully built-up attack from the Ypres salient by slipping away behind the Steenbeek. The IV. Army higher command considered that on account of the difficult ground the attack across the Steenbeek had no chance of success unless it were newly organized, and postponed the execution from day to day. As since April 17 the French had been established at Wytschaete the arrival of further French reënforcements had to be reckoned with.

On April 20, therefore, General Ludendorff ordered the beginning of the offensive. With a view merely to improving the tactical situation of the inner wings of the VI. and IV. Armies the attack on Mt. Kemmel was carried out on April 25. The piecemeal capture of Festubert and Givenchy did not succeed.

On May 1 Ludendorff came to the decision to place Rupprecht's army group and also the XVIII. Army on the defensive for the time being. The Georgette operation had, apart from destroying the Portuguese, undoubtedly inflicted another heavy blow on the British army. Its losses in the defeats of March and April might be estimated at not less than half-a-million men. The fact that Foch was forced to send about 18 French divisions and 6 cavalry divisions to Flanders suggested that the British alone were not in a position to resist the pressure put upon them. It was also an important point for the German Supreme Command that it had for many weeks had the lead in the western theatre of war and had forced the opponent to stand on the defensive. Yet it could not record any operative success in this new place. Then, too, the Michael and Georgette offensives had used up a large number of forces—113 divisions—and this fact weighed heavily. Taken in conjunction with the difficulties about drafts there was no doubt that the balance of forces was gradually becoming unfavourable to the Germans.

It is indeed questionable whether the German command had it in its power to raise this strategically unsatisfactory result to the level of a striking success. With the forces actually available, and those that were put in, it would hardly have been possible, even if certain errors in the subordinate command had been avoided. The greater part of the divisions used did not belong to the mobile divisions, which had been trained and equipped for the attack, and others were worn out by fighting. There was, therefore, a certain lack of the necessary freshness and tenacity in attack. If the German Supreme Command had decided at the end of March to stop the Michael offensive and desist for the time being from the attack on the Archangel front, there would have been fourteen more unused divisions available at the beginning of the Georgette attack. With this additional strength considerably more pressure could have been exercised, particularly by the IV. Army, to the N. of Armentières and N.E. of Ypres.

With the situation as it stood at present the difficulties in the way of forcing the decision of the war before the Americans made themselves felt were growing. In spite of this Ludendorff remained unshaken in his aim, clearly recognizing that the Germans could now only achieve a success through their own initiative and by working against time. All the clever advice that subsequent criticism felt obliged to offer Ludendorff is met by the objection that by none of it could the victory of the Germans have been achieved. If the Allies were now allowed time, and were able at a self-chosen moment to use their fighting force, with its ever-growing superiority in personnel and material, for their own final blow, the war might be given up as lost at once.

The necessary forces were lacking for an immediate fresh German offensive. During the next few weeks it was imperative that the mobile divisions, some of which had been overtaxed, should be allowed to rest and freshen up again. By May 27 the German reserves had been brought up to 81 divisions again, exclusive of the transport movement from the east. Of these 58 had been resting.

The direction which the operations were to take had now to be decided. The French and British now formed a united front, and the former plan of beating each separately was no longer in question. At the end of April there were from 10 to 12 French infantry divisions and 6 cavalry divisions established in Flanders. In front of the German XVII. Army at Doullens was the French X. Army with from 5 to 6 divisions. At Amiens and S. of it stood a group of from 12 to 14 fresh French divisions. As Foch had also released about 20 divisions by putting in territorials and Americans and economizing on numerous sectors, he now had at his disposal a reserve of over 60 French divisions. About half of these he kept to defend the coast and at Amiens, the other half being apparently distributed in readiness before the fronts of the remaining army groups. An offensive to force a decision against those sectors of the front held almost exclusively by the French from the Somme to the Swiss frontier promised the Germans a far-reaching operative success, at whatever point it might be attempted. The one sharply-defined objective in this connexion was Paris. But on the way there an encounter with the French army, prepared to defend it to the uttermost, was certain; and a defensive battle for them would have various advantages. On the other hand if a German attack should sooner or later find itself stuck fast on the way to Paris or in Champagne—as might almost certainly be predicted—the Germans would be in an unfavourable position for operating, with their line bent more or less far forward toward the S.W. or S. There seemed more prospect of success in resuming the offensive on the Michael—or Flanders—front, where the objectives were not fixed so far away. After all, the Germans had covered half the distance from St. Quentin to Abbeville in March well within a week. If they could succeed in doing this again with the same bulk and expansion, they would throw the enemy forces opposing them into the sea. But even with less success at first they might hope so to cramp their opponent's freedom of movement that his power of prolonged resistance would weaken, and he would be completely crushed by renewed hammer-like blows. The German Supreme Command therefore sought to gain their strategical aim as before in an attack on the northern part of the enemy's front. Clear on this point, it was again confronted, as in the spring offensive, with the choice between carrying out the operations in Flanders or farther S. against the Arras–Amiens front.

Acting on the suggestion of the Higher Command of Prince Rupprecht's army group, General Ludendorff in the beginning of May decided on the Flanders attack. The determining factor was the knowledge that an attack from the Michael front in the direction of Doullens would tactically be extremely difficult, depending for its success on a simultaneous side-attack from the region of Béthune, for which the forces were not adequate. But as there were still strong French reserves in Flanders at the time, Ludendorff decided not to lead the attack against Poperinghe–Hazebrouck until a diversion in another place had drawn off considerable portions of this reserve from the Flanders front, leaving it weakened in consequence. At the suggestion of the Higher Command of the German Crown Prince's army group, a diversion—offensive within a limited area from the VII. Army front on the Chemin des Dames across the Aisne as far as the Vesle—code name "Blücher," was given preference over an attack by the I. Army in Champagne, E. of Reims, because its clearly defined aim offered the promise of a line suited both to a prolonged defence and a continuation of the attack. The VII. Army's task was limited to carrying the offensive over the Aisne sector on both sides of Soissons and over the Vesle as far as the heights to the S.W. and S.E. of Soissons and S. of Fismes, while the right wing of the I. Army was to accompany the attack westwards past Reims and nearly up to the Ardre. There was also an idea of letting the XVIII. Army push forward its left wing across the Oise to split up the counter-offensive.

By choosing the Blücher attack Ludendorff was again faithful to his principles in selecting a markedly weak spot in the enemy's front. There were at this time in the front line only 6 French divisions—of which 2 were worn out and 1 weakened by illness—and 2 British divisions which had been defeated in March and April. As regards reserves, there were supposed to be 2 fresh French divisions and 2 that had previously been beaten in the region between Compiègne and Reims. As against these the VII. Army had 29 divisions, the I. Army 4 divisions at its disposal. The Supreme Command reserved the right of taking back strong artillery forces from Rupprecht's army group and the powerful fighting divisions drawn back behind their front. This time, too, the attack was to break out as a complete surprise, and be relieved by opportune feints on different parts of the other armies' fronts. Owing to the comprehensive preparations the Blücher attack could not be launched until nearly the end of May.

It began on May 27 and succeeded beyond all hopes. By the evening the VII. Army's centre had reached the Vesle on both sides of Fismes, the wings holding back somewhat. The morning of the 28th brought an emphatic reminder from Ludendorff that the object was to get possession as quickly as possible of the high ground W. of Braisne, S. of Fismes and Bazoches and N.W. of Reims. The right wing was to advance by means of a sharp attack to a line on the high ground between the Oise and Aisne canal and the Aisne in a W. direction. The successes of the 28th enabled fresh orders to be given for advancing the objectives of the centre and left wing to Fère en Tardenois–the heights S. of Coulanges–the S. front of Reims. If the opponent evacuated the territory between the Aisne and the Oise, the XVIII. Army was to draw up forces on the S. bank of the Oise about Noyon and to gain ground in the direction of Compiègne. On May 29 the successes on the VII. Army's front were spreading rapidly, and orders were given at noon for the attack by the left wing of the XVIII. Army and the VII. and I. Armies to be continued in the direction of Compiègne–Dormans–Epernay and the block of hills between the Vesle and the Marne, S. of Reims, taken as a protection against Chalons. The progress of the VII. Army corresponded to these instructions. The I. Army, which had had difficulties to contend with, received an order on the morning of May 30 to reënforce its right wing from the centre, and shoot out its fighting line to the S. and S.W., thereby facilitating the envelopment of Reims. The VII. Army meanwhile had reached the Marne on the 30th with its centre, and on the following day gained a good deal of ground in the direction of Villers Cotterêts, but the two wings of the attack did not seem able to make any further progress. The Supreme Command was for the moment inclined to send portions of the VII. Army over the Marne to push forward on Epernay, with the idea of getting the attack of the I. Army into swing again. But this scheme was dropped in consideration of the state of the troops and the strength of the enemy's resistance. The I. Army was to have a rest, and then be required only to undertake partial actions with limited objectives and to capture Reims. The Supreme Command was now anxious to get the centre of gravity fixed on the W. front of the VII. Army in the direction of Villers Cotterêts and La Ferté Milon, in order to attract powerful French forces. Reënforcements were therefore sent up from the zones of the other army groups. But the VII. Army attack in a W. direction made no more progress to speak of in the beginning of June, as the French had established themselves here in great force by hurrying fresh troops on to the scene.

The continuation of the offensive now depended on the progress of the attack launched on June 9 from the S. front of the XVIII. Army on the Matz brook and the Aisne above Compiègne (code name, "Gneisenau"). But this attack by the XVIII. Army did not have the anticipated success, which would have justified the immediate opening of the Flanders offensive, but came to a standstill on April 11. A blow delivered by the VII. Army against Villers Cotterêts to the S.W. of Soissons on the following day also failed, and as the immediate continuance of partial actions by the I. Army did not look like succeeding either, a lull set in along the whole new front of the German Crown Prince's army group in the middle of June.

The Blücher attack was not looked upon as an operation to force a decision, but rather as a diversion. The fact that the original limited objectives were exceeded in consequence of the unexpectedly favourable course taken by the attack is not incompatible with the leading idea, which aimed at holding and destroying the greatest possible number of the enemy's forces. This aim was fulfilled. The total number of the French engaged in the defence against the Blücher offensive was estimated in the beginning of June at over 40 infantry and 3 cavalry divisions. On the Marne the wavering French lines were only saved by fresh American divisions. This time the Germans spared their troops by avoiding costly independent battles of only local importance. At the same time the development of the tactical success should not have brought about an unfavourable operative situation at the close of the offensive. But this was exactly what happened. As the wings had not succeeded in getting the region of Compiègne and Reims, with its hilly country, under their control, a new sack-like bulge had been formed in the German position, with the flanks bent far back, to maintain which strong new forces would have to be put in. The rearward communications of the VII. Army were particularly unsatisfactory owing to the lack of railways. This unfavourable operative situation could perhaps have been avoided if from the beginning strong pressure had been used to push forward the right wing along the Oise to the Marne, and the I. Army to Reims, at the cost of some of the excessive amount of ground gained in the centre. Later attempts to work up the operation from the centre were impaired by the gradually failing fighting strength of the troops. According to Ludendorff a subordinate command also failed to carry out a swift and powerful advance through Soissons. The advance of the VII. Army's right wing along the Oise, which began later, was inadequately provided with the means of attack, and the Gneisenau attack by the XVIII. Army W. of the Oise, which followed, was apparently even less well prepared; neither could retrieve the results which could presumably have been obtained without much effort at the very beginning of the offensive, had the forces on the VII. Army's right wing been differently grouped. The disadvantageous strategic situation at the close of the attack corresponded with the tactically difficult fighting position in which the tired-out German divisions were confronted with the active defence offered henceforth by the French and Americans.

The German Offensive in July.—The effect of the Blücher attack very soon made itself felt on the front of Rupprecht's army group, where no little relief was felt. The enemy's fighting activity diminished, and a portion of French reserves intended for the support of the British vanished from the scene. All the same, this degree of slackness on the enemy's part did not seem to the German Supreme Command to warrant the carrying out of the planned and prepared attack on the Flanders front (code name "Hagen") for the present. They hoped first, by carrying out another of the diversions on the front of the German Crown Prince's army group, to rob the British of the last of their French support, and even in certain circumstances to force them to send direct help themselves to their hard-pressed ally.

On June 14 Ludendorff arranged for the German Crown Prince's army group to attack with the VII. Army across the Marne, E. of Château-Thierry and between the Marne and Reims (code name "Marneschutz"), and with the I. and III. Armies between Reims and the Argonne (code name "Reims"). July 10 was the date aimed at for the beginning of the offensive. About 10 days later, after a rapid regrouping of the necessary artillery and so on, the Hagen attack was to be executed by Rupprecht's army group in Flanders. Ludendorff in his *Memoirs* gives the reasons for selecting new points of attack on the French front as follows: "The greater part of the enemy's reserves were to be found within the curve formed by the XVIII. and VII. Armies in the direction of Paris, only weak forces being left between Château-Thierry and Verdun. The Supreme Command intended this time also to attack the enemy where he was weakest."

The underlying idea of the VII. Army's far from simple operation on both sides of the Marne toward Epernay was inspired by the desire to escape from the tactically constrained position brought about by the pocket on the Marne. By flattening out the left flank of the pocket by eastward pressure, not only would the army's rearward communications be widened, but the danger which perpetually threatened the right flank would be diminished. While the necessity of supporting this flank on the sector from Villers Cotterêts to the Marne during the attack was pointed out to the VII. Army, the forces needed for such support were not placed at its disposal. It is not by any means clear on what grounds the decision was taken to extend the diversion very considerably toward the east by calling in the III. Army. It was probably in the hope mainly of splitting up the enemy defences along as wide a front as possible. General Buat points out that the offensive, if successful, would have opened up brilliant strategic possibilities, such as extending the successful advance in the direction of Bar le Duc and rolling up the whole defensive position in the Argonne and toward Verdun. A shortening of the German position from Château-Thierry through Chalons to St. Mihiel would have been infinitely valuable.

On the other hand the 44-m. front required such large forces to occupy it that, contrary to the original intention, it was necessary to fall back on some of the divisions set aside for the Hagen attack in rear of the Rupprecht group's front. The inevitable consequence was the postponement of the date provisionally fixed for the Flanders attack to the beginning of August. Also the preparations for the combined Marneschutz-Reims attack proved so extensive and took up so much time that the date had to be put forward to July 15 at the cost of preserving secrecy. Once more the execution depended upon surprise.

Through carelessness and treachery the German plans became known to Foch to a great extent during the first half of July. He had found time for adequate preparation of his defence, which was skilfully adapted to meet the German conduct of the attack. In this way the offensive in the case of the I. and III. Armies came to a standstill everywhere in front of the French main position. The VII. Army succeeded, after a successful crossing of the Marne, in shattering the main line of defence in several places. But here, too, far-reaching results were unobtainable. On July 15 the German Supreme Command ordered the cessation of the attack for the III. Army, and on the 16th refused to allow the I. Army to continue after an attempt had proved vain. The VII. Army continued to advance with great difficulty until July 17 in some places. The offensive blow had in fact completely failed, because it fell upon an enemy who was not taken by surprise but was prepared to offer a resistance as obstinate as it was skilled.

Ludendorff lost no time in drawing his conclusions from the unexpected turn in the general situation, and immediately ordered the withdrawal of the right attacking wing of the VII. Army behind the Marne. He was determined to regroup his forces with all possible speed for the Hagen attack in Flanders. Hardly had the necessary steps been taken, however, when, on the morning of July 18, Foch's flank attack fell on the insufficiently supported W. front of the VII. and IX. Armies. Owing to the disproportionate initial success of this attack, the execution of the Hagen attack had to give place to the pressing necessity of putting fresh forces into the VII. Army and bringing it back behind the Vesle. This was the turning point in the conduct of the war in 1918, and at the same time in the whole of the World War. The German offensive had met first with a sudden interruption, then with its final close, owing to the initiative of the opponent. From this time onward the German Supreme Army Command was subject to the strategical law of the enemy.

If we pass in review the many plans of attack entertained by the German Supreme Command—the Flanders attack, for instance, was, if circumstances permitted, to be followed by an offensive on Paris or Amiens—the impression is easily formed that the leader of the German operations was no longer pursuing a definite operative aim, as at the beginning of the spring offensive and for some time afterward, but had as his sole object the shattering of the enemy by independent hammer-blows delivered one after another at tactically advantageous points. But all these hammer-blows represented not the end but the means by which the final decisive operation should be prepared, facilitated and brought to a successful issue with the highest degree of certainty and the least effort. One misgiving undeniably arises in considering this method. The limitation of the available attacking forces and fighting material made it impossible to make the individual blows follow each other so quickly that the enemy would have no time to recover between each, to a certain extent, to make good the losses he had suffered, to prepare his defence against fresh blows, or even recover so far as to proceed to counter blows himself. The question is therefore whether a different procedure, after the close of the May-June offensive at latest, might have had more chance.

Possibly the necessary forces for the Hagen attack in Flanders, which was to have been the decisive operation, might have been mobilized by the middle of July if it had been decided to sacrifice the whole of the territorial gains, which were exhausting and difficult to maintain permanently, made up till then in the Michael and Blücher offensives, by a retreat movement on a large scale by which the fronts of the XVII., II., XVIII. and VII. Armies would return to their starting positions. With these forces a new and overwhelming surprise attack in a totally different form might have been sprung on the enemy, which would prevent his throwing his released forces straight on to the Flanders front and there avoiding a crash. What Hindenburg and Ludendorff had achieved with unexampled skill in Nov. 1914, immediately after the great retiring movement through S. Poland, by advancing from a newly selected position to a flank attack on the right wing of the Russian main army, could have been repeated in the summer of 1918 on French-Belgian soil when the general situation was strategically favourable.

In view of the complete failure from the outset of the attempt to realize their daring and far-reaching projects, there has been too much of a tendency to accuse the German Supreme Command of misjudging the situation, overestimating the working value of their own instrument of war and underestimating the enemy. Yet it was under no illusions as to the difficulties that it was essential to overcome. It was clearly recognized that time was now, more than ever before, a factor on the side of their enemies. The British had regained their strength, the French were not yet sufficiently shaken, and the Americans were bringing unexpectedly large masses of troops to France with amazing rapidity. To set against these factors the German commander-in-chief could count on no more reënforcements of any kind. No additional force for attacking purposes could be extracted from the divisions left in Russia and Rumania, which had already given up all their men under the age of 32. The drafting reserve from home was becoming more and more meagre, bringing in only 28,000 men for the infantry in June as against 44,000 in May. It was composed mainly of returned lightly wounded men, and those who had recovered from sickness. The average strength of the German battalion in the field had sunk by the middle of July from the original 850 men to 660. The actual front strength was even considerably lower than this number. The process of disintegration within the army caused by the prevalence of revolutionarily minded elements, did not escape the notice of the Supreme Command. Taking all in all, there was no doubt that the fighting value of the troops was no longer on the same level as at the beginning of the spring battle.

In spite of this there was no compelling reason to doubt the adequate striking power of the jagged though not blunted weapon of the German army, so long as its intentions and plans were kept absolutely secret, as before, and the blow was once again aimed at one of the enemy's weak spots.

Unfortunately for the Germans, their method of attack had now lost its magic effect on the enemy, who had found times and means to organize his resistance accordingly. The July offensive had been made with the greatest circumspection and thoroughness of preparation, just as before; and the attacking forces were certainly not deficient in courage or endurance. But an essential factor in the success of the undertaking was lacking—no commander-in-chief can do without luck. Hitherto the luck had been generally with Ludendorff. Now, at the decisive moment of the World War, it deserted him, and went over to his opponent—his equal in determination and will-power, and now his superior too in strength. If Ludendorff had had the luck at Reims in July 1918 which attended him at Tannenberg, history might have acclaimed him the greatest commander of all time, because he had remained true in spite of everything to himself and his belief in his star. But this was not to be. (W. F.)

IV. THE ALLIED OFFENSIVES OF 1918

The fourth and last phase of the war was ushered in by the failure of the German Champagne-Marne attack of July 15 and the success of the Allied counter-attack at Soissons on July 18, the results and far-reaching consequences of which came as a surprise to German and Allied commanders alike. Von Hertling, the German Chancellor, has written: "We expected grave events in Paris for the end of July. That was on the 15th. On the 18th even the most optimistic among us understood that all was lost." To make clear the significance of that statement it is necessary to review briefly the condition of the opposing armies previous to the Soissons attack.

It was indeed well known to both sides that the German army was nearing the end of its offensive strength, but just how nearly German *moral* had been drained neither side fully appreciated until later for, superficially, it was good. The French army, on the other hand, was well known to be at its lowest ebb of *moral*. The French soldier, since April 1917, had ceased to be a war machine unit who could be depended on blindly to follow his leader and had assumed a certain independent thinking rôle. Discipline had slackened and orders to attack or defend stubbornly had lost their force unless the soldier wished to attack or defend stubbornly. Pétain considered, early in July, that, although he had a number of rested divisions in reserve, he had not a single division which could be relied upon to push home and exploit an attack successfully. Of such as he had the Moroccan Div. was rated the best. The superiority of the British *moral* had been offset by the numerical weakness of their battalions, and, although they were holding their own doggedly, their confidence in their allies had suffered a severe strain and grew still further impaired as the lower units became intermingled. The American army was, of course, as yet an undetermined factor.

It was therefore with a certain amount of reasoned justification that Ludendorff, aware of these conditions, to which moreover he added an amazing underestimate of the strength of the American effectives in France, conceived that one more push directed against the French army would put it into headlong flight and thus pave the way for a similar stroke against the British. The adverse factors in the Champagne-Marne project were, first, that the method of attack, the so-called "Riga model," now lacked the element of surprise, since the methods of concentration for it were now too well known to make concealment possible, and its success was further discounted because Pétain had discovered the tactical means of effectively stopping such an attack; second, that Ludendorff had overcentralized his command. No army group commander or army commander was called on or permitted to exercise judgment or decision; he could only carry out the plans devised by Ludendorff and his staff by methods similarly devised and prescribed. In the lower ranks of officers this benumbing influence was, if anything, still more strongly felt. Meanwhile, synchronously with his success in thus centring the power of decision in his own hands, Ludendorff had become preoccupied with a multiplicity of problems which had no immediate relation to the conduct of the army on the western front. Germany's allies, her own internal questions, the Russian and Near East situations, were all constantly taking his time and distracting his attention from the western front, although nothing on that front could be done without his dictation. A further cause of weakness was that propaganda, among soldiers and civilians alike, had been overdone. Although the soldier indeed still responded to propaganda, it was only to the most extreme statements. Therefore in order to stiffen in the men the will to fight more resolutely in the attack planned for July 15 they were told that the French were already beaten and exhausted; that the British were ready to go out of the war; that the American army could not get to France, and that, even if it could, it could not fight; that the Champagne-Marne attack was to be the "peace-assault" which would end the war if successful, although as a matter of fact the utmost which Ludendorff really expected of it was that it would pave the way for a similar attack on the Lys. When therefore this attack of July 15 failed, and the French army showed itself anything but a beaten force, and when, three days later, the supposedly non-existent Americans established alike their presence and their fighting ability by marching through the German lines S. of Soissons in a fashion which compelled the evacuation of the whole Marne salient, the scales dropped from the eyes of the German soldier. To him the war was now lost; it was time to go home. Thereafter, curiously enough, while no longer crediting his own official propaganda, the German soldier became most receptive to Allied propaganda, and looked to it for the truth.

On the Allied side conditions and conceptions were in general more correctly adjusted. The French leaders knew the weaknesses of their opponents, but were also cognizant of their own, and they were more successful psychologists in dealing with their own men. The British army, having again been recruited up to fighting strength, felt that it had nothing further to fear from the worn-down German army so long as the French line held. The American army, supremely confident in every rank, longed only for the opportunity to disprove the belittling judgments of its opponents and to remove the doubts of its allies as to its fighting capacity. Further, the Allied High Command had the supreme merit of being not only in capable hands but, to a rare degree, decentralized. The attention of its leaders was not distracted from its own field by the necessity of solving distant problems in politics or diplomacy, and was backed in all the principal Allied countries by statesmen who in every way supported and aided the military chieftains, without, on the whole, unduly interfering with the conduct of the armies. Although the Supreme Command was nominally in the hands of Marshal Foch, he was a coördinator of efforts rather than a dominant military commander; and in fact he lacked the staff which would have been necessary for such a control as that exercised by Ludendorff over the German armies.

The plan for the Soissons counter-attack of July 18 was not a new one. As early as the German offensive on the Aisne (May 27), it had been proposed by a member of Gen. Pétain's staff, had been approved by his chief, and its details had been worked out. Marshal Foch had likewise favoured it, although hesitatingly, because of the attitude of the authorities in Paris. The difficulties of execution at that time lay in finding divisions of "attack-class" for the spear head at the crucial point. By the middle of July, with the increasing number of American divisions, which had gained and were gaining battle experience, that difficulty disappeared. On July 11 Pétain, on Pershing's insistence, again urged this plan upon Marshal Foch, purposing now to make it immediately after the long-awaited German Marne attack. Foch gave it his approval, not indeed with any hope of gaining thereby any decisive advantage, but rather regarding it as a desirable counter-stroke to the German assault.

The striking success of this counter-attack, which in two days gained and held control of the German communications in the Marne salient, and thereby compelled its evacuation, brought to the Allied leaders, as it did to many in Germany, the discovery that the tide of victory had already turned. On July 24 Foch arranged a meeting of the commanders-in-chief at Bombon, to discuss the means of following up this success and of preserving to the Allies the initiative thus unexpectedly gained.

The chief misgiving of the French Government at this time, now that Paris had been rendered secure through the driving of the Germans back from the Marne, was the lingering apprehension that the enemy might still drive a wedge between the French and the British armies at Amiens. It was therefore particularly welcome that Field-Marshal Haig should propose an attack on the Amiens salient to be made by the newly formed Australian corps, now in that sector and desirous of making the attack, together with the Canadian corps, which had not yet been engaged in the year's battles. At this meeting also it was decided to assign to the American army the reduction of the St. Mihiel salient as its first distinctive operation, but meanwhile to employ this new army in completing the reduction of the Marne salient. All the commanders-in-chief at this meeting expressed themselves as favouring a continuation of offensive action, yet still with the idea of keeping the German army busy, of wearing it down, of seizing favourable occasions and localities for attacks to gain prisoners and material and reconquer useful bits of territory, rather than with any thought of a systematic plan for ending the war by victory before winter.

During the two weeks following this conference the German army was forced back slowly from the Marne salient, now become a mere pocket, which was, however, held stubbornly because in this area there had been captured from the French, in May, vast quantities of munitions and military supplies of all kinds and of materials which were urgently needed in Germany, but which there had not been time or facilities for removing. In addition a vast amount of German material had been brought up for the maintenance of the army on the Marne front, and for the July 15 attack. Much of this was irreplaceable, and the German army had to fight to gain time to remove as much of it as possible.

Ludendorff, who had been present with his army during the Champagne-Marne drive, was not especially disheartened at its result and had gone to Flanders hoping to recoup his failure in Champagne by hastening the preparations for his offensive next in contemplation in the Lys salient. It was there that he received news of the Soissons reverse. He immediately realized the threatening consequences to his armies of this Allied counter-thrust, and returned to Avesnes to arrange the necessary withdrawal from the salient.

Materially this retrograde movement did not seriously compromise the German army, since, except during the penetration by the three assault divisions (two American and one Moroccan) S. of Soissons on July 18 and 19, the withdrawal was made slowly and in good order, inflicting as heavy losses on the attackers as the Germans themselves suffered. But Ludendorff soon recognized that the Lys offensive would have to be indefinitely postponed and the troops destined for it used in easing the situation in the Marne salient, where the Allied forces—French, British, American and Italian troops—were now pressing vigorously from all points. What Ludendorff apparently failed to gauge correctly at this time was the resultant damage to the *moral* of the German army; neither did he yet, seemingly, share the conviction, which had now been brought home to the German people and to Germany's allies, that all hope of ending the war by a German victory was gone, and that the only question left impending was whether it would end by a compromise or by the utter defeat of the Central Powers. Had the German High Command faced at this time the logic of the situation and made a decision to do, after the "Second Marne," what most German officers have since agreed should have been done after the first battle of the Marne, namely, to retire to the line of the Meuse and re-form, subsequent history might have differed materially from the actual events.

As proposed by Haig on July 24, the Australian and Canadian corps on Aug. 8 attacked side by side the German salient facing Amiens, supported by a French corps on their right and a British corps on the left. This attack was one of the most brilliant and tactically interesting episodes of the war, and showed Ludendorff again that the much disparaged tanks were, on ground suitable for their employment, a potent factor in a surprise attack. Although the sector against which the assault was launched was held by first-class troops, the German divisions were overrun and virtually annihilated as organized units. This attack dealt a stunning blow to the pride of the German High Command, a deadly one to the weak *moral* of the troops, and produced a corresponding exhilaration in the British army, all ranks of which could now clearly see that a complete and final inversion of rôles had taken place.

The shock was felt throughout Germany and reacted strongly upon the Government. The unsuccessful Marne attack, with the subsequent withdrawal from the Marne salient, although manifestly a lost battle, had, nevertheless, been one initiated by the German High Command on a battle-field of its own choice. The battle of Amiens could not be so interpreted. The Allies had here initiated the attack and it had been completely successful. Ludendorff correctly names Aug. 8 as the "Black Day" of the German army in the war. So grave was the crisis felt to be that a conference of army leaders and members of the German Cabinet was called to meet at Spa on Aug. 13. It was there agreed that further prosecution of Germany's war aims was hopeless, and that a peace would have to be negotiated at the first favourable opportunity, that is, at the first turn in the military situation even temporarily favourable to Germany. That looked-for turn never came. Under the persistent Allied attacks the German army reserves steadily dwindled, munitions and supplies lessened, and *moral* evaporated.

The day following the Amiens success Foch decided not to put the American army—which now had some 1,250,000 men in France—in on the Vesle, where the situation was virtually stabilized, but to assign it at once the task of reducing the St. Mihiel salient (*see* WOËVRE, BATTLES IN).

The battle of Amiens was followed up by a French attack between the Oise and the Aisne on Aug. 20, which forced the German line back on Chauny. Still more serious for the enemy was the attack by the British III. Army, on Aug. 21, N. of the Somme, on the line Bapaume–Péronne, which brought another crisis. By the end of Aug. the military situation had become sufficiently defined to enable the Allied leaders to look beyond a mere driving of the German army back to its strongly fortified lines of the previous winter, popularly known as the Hindenburg line, and to make plans for its rupture in a way to reap the largest strategical as well as tactical fruits of victory.

For this the British army, now fully restored in man-power and in high *moral*, and the American army, untouched by war weariness or reverses, inspired by an almost religious fervour of belief in the righteousness of the cause in which it was fighting, were of necessity regarded as the chief Allied weapons. The French army was tactically a trained and skilled army, but could no longer count on any large reserves of man-power to replace losses, and the general feeling among the French that their country had already been "bled white" in the war led to the not unreasonable contention by Government and people that, while France must still do her share to the end, her army must from now on be spared as much as possible, since in any event French losses in man-power would far exceed that of any other nation in the war.

Foch, therefore, determined on two main offensives: the British, supported on their right by the French, were to break the Hindenburg line in the direction of Cambrai–St. Quentin; the Americans, after completing the reduction of the St. Mihiel salient, which had been assigned as their first task, were to break through the German lines of defence N. of Verdun, supported on their left by French armies, and to advance in the direction of Mézières. In other words, the German line in northern France, constituting as it did a huge salient, was to be attacked in the simple orthodox manner by pinching in the two flanks. Of these two the Americans had possibly the harder task, for the Verdun front was well adapted to and thoroughly organized for stubborn defence, and, inasmuch as the railway communications through Sedan–Mézières were essential to the German army so long as its front lay W. of the Meuse river, the Verdun front, only 50 m. in front of this railway line, was bound to be defended with all the vigour and skill still remaining in the German army. Connecting these two attacks, the French army was to continue its operations to throw back the Germans beyond the Aisne and the Ailette. Such was the Allied plan formulated in Foch's directives of Sept. 3.

By the end of Aug. the German High Command ordered the evacuation of the Lys salient, and it was completed Sept. 6.

On Sept. 2 the attack of the British III. Army N. of the Somme was extended northward, E. of Arras, to include the I. Army reinforced by the Canadian corps; and as a result the whole German army fell back to the so-called Hindenburg line, which the Germans themselves designated the *Siegfried Stellung*. There they hoped to gain time to reorganize the depleted units.

This withdrawal, and the accumulating evidences of increasing demoralization in the German army, made it evident to Allied military leaders that offensive operations on a still larger scale could be safely initiated; and Marshal Foch, in a conference with the British and Belgian commanders-in-chief at Cassel Sept. 9, arranged for a fourth offensive, on the extreme northern part of the western front, to force the Germans back towards Ghent.

On Sept. 12 the American I. Army, as previously agreed upon, attacked and captured the St. Mihiel salient.

During the latter part of Sept. German H.Q., harassed and preoccupied by the crucial events which were taking place in other theatres, either gave insufficient heed to the precariousness and difficulties of the German military situation on the western front or were too stunned by their sudden and general reversal of fortune everywhere to be able to grasp and cope with them. Ludendorff, it is true, had two lines in rear reconnoitred: one from the Dutch frontier–Bruges–Valenciennes; the other Antwerp–Brussels–Namur–the line of the Meuse; but neither line solved the problem, nor could it be held in the face of a victorious pursuing enemy. The desideratum was to find a secure position for the army's winter respite from active operations, and time for the resting, reorganization and recruitment of the armies. It was possible to accomplish this only by a timely withdrawal, to the line of the Meuse at least, if not to the frontier. But Ludendorff still clung to the idea of holding every foot of French territory until the last possible moment.

On Sept. 26 the final Allied offensive, prepared by the directives of Foch, began. The American army under Pershing and the French IV. Army under Gouraud attacked on the Verdun and Champagne fronts (*see* MEUSE-ARGONNE, BATTLE OF). On Sept. 28 the Belgians, supported by a French army under Degoutte and the British II. Army under Plumer, attacked the line from the coast southward beyond Ypres (*see* YPRES AND THE YSER, BATTLES OF, *Part iv.*). On Sept. 27 the British III. and I. Armies, including the Canadian corps, had attacked on a front of 13 m. in the direction of Cambrai, and on the 29th the British IV. Army under Gen. Rawlinson, after a heavy bombardment lasting two days, attacked the St. Quentin sector.

The American and Belgian attacks had the advantage of coming as a complete strategic surprise; but, in the case of the Meuse-Argonne front, the depth of the fortified zone behind the front lines enabled the German reserves to be brought up and increasingly strong resistance to be made. Both British attacks were made against strongly organized positions held by the best troops the Germans still had; but on the front of the British I., III. and IV. Armies the enemy was already virtually on his rearmost prepared line, the attack was not unexpected, and both opposing armies appreciated thoroughly the consequences of victory and defeat. If driven from the Hindenburg line the weakened German army must thereafter fight in the open. The contest was therefore bitter to the point of desperation, but, even with the aid of the elaborate system for defence afforded by the long-prepared Hindenburg line, the struggle proved unequal, and the German army was forced back with heavy losses, to begin its retreat through the open country.

The German High Command had not appreciated the risk of accepting battle on the Hindenburg line, or else had over-estimated either the strength of the position or the remaining fighting capacity of the troops. Once the line was broken, however, they awoke to the situation. On Sept. 28 Ludendorff and Hindenburg agreed that the end had come; on the 29th the Foreign Minister was informed of the army's desperate plight; on Oct. 1 Hindenburg and the Kaiser went together to Berlin, and on Oct. 4 the first peace offer was sent to President Wilson.

On the battle-front the Allies were not permitting events to lag, and this same day renewed efforts were made on all fronts. The French V. Army under Berthelot had advanced from the Aisne and on Oct. 6 reached the Suippe. On Oct. 7 Foch ordered the attack on the right flank, extended to include the heights E. of the Meuse. On Oct. 8 the British I. and III. Armies renewed their attacks, and in three days drove the Germans back beyond the line of the Selle river–Le Cateau.

Between the two sectors of the Allied main right and left flank offensives lay the strong defensive German positions W. and S. of Laon. On Oct. 9 these positions were abandoned by the enemy, and the whole German line between the Scheldt and the Aisne began its retreat. By Oct. 10 the American I. Army had penetrated to the last line of German defences on its front, the *Kriemhilde Stellung*, and cleared the Argonne forest, while on its left the French IV. Army reached the Aisne.

On Oct. 10 a new directive of Foch gave more distant objectives to the armies; the Northern Flanders Group was to advance toward Belgium; the British armies, debouching from the front Solesne–Vassigny, were to push both in the direction of Mons and toward Avesnes; on their right the French I. Army was to push up the Oise; while the French and American armies between the Aisne and the Meuse were to continue their northward movement. The Marshal defined the purposes of these converging attacks to be to force the Germans back on the rough Ardenne forest, where communications were lacking and a modern army would have difficulty in maintaining itself.

On Oct. 12 the French X. Army of Mangin, on the left of the V., reinforced by an Italian corps, passed the Aisne and occupied the Chemin des Dames. On Oct. 14 the army group under King Albert renewed its attack on the front from the Lys to Dixmude. The Germans were unable to hold; Lille had to be abandoned, and, under the combined pressure of this and the British attack, the whole German line N. of Cambrai rolled backward in disorder, toward the Scheldt, closely pursued. The Americans also attacked on the 14th, with important gains W. of the Meuse.

On Oct. 17 the British IV. Army and the French I. Army attacked the hastily improvised German line between Le Cateau and the Oise. On the 20th the III. Army attacked the line of the Selle, supported by the I. Army astride the Scheldt. Both attacks succeeded.

The conditions of the fighting are best understood by referring to the German reserves. From 69 divisions in reserve when the attack of Sept. 26 was begun the German army had been reduced by Oct. 15 to 26 divisions in reserve, of which only 9 were rested. Of the divisions in line many were unfit for combat, but could not be replaced.

Toward the end of Oct. the dissatisfaction in Berlin and elsewhere with the Government had become intense. The people felt that the war had been mismanaged and that they had been deceived. In an attempt to appease them Ludendorff was dismissed on Oct. 25, and his place as quartermaster-general was taken by Gen. Groener. But it was too late to save either the Cabinet or the Monarchy, for with the disaster to the army from the vigorous Allied attacks of Nov. 1 and following days the Kaiser was forced to abdicate on Nov. 9.

On Nov. 1 the Allied armies began their final drive. On the right the American I. Army on the Meuse-Argonne front effected a clean break through the German lines, and began an active pursuit which was only stopped by the Armistice on Nov. 11. On the left of the American armies the French IV. Army was equally successful. Farther N. the British I. Army attacked the line of the Rhônelle river and completed the evacuation of Valenciennes. This attack was followed on Nov. 4 by a general attack by the British I., III. and IV. Armies, on a 30-m. front, from Valenciennes to the Sambre, N. of Oisy. In spite of serious natural obstacles, having to force the crossings of the Sambre on the right and to penetrate the forest of Mormal in the centre, the line was advanced 5 m. on Nov. 4. This battle finally broke the German power of resistance, and the German army began a retreat along the entire northern front, though it still offered stiff resistance to the British I. Army on Nov. 5 and 6.

On Nov. 9 the important railway centre and fortress of Maubeuge was taken and the II. Army crossed the Scheldt on its entire front. On Nov. 11 the Canadian 3rd Div. captured Mons. Farther N. the Belgian army stood before Ghent.

On Nov. 9 Foch had telegraphed all commanders-in-chief: "The enemy, disorganized by our repeated attacks, yields on the entire front. I appeal to the energy and initiative of the commanders-in-chief and of their armies to render decisive the results gained." On the same day the German delegates presented themselves at Rethondes to ask terms for an armistice, which were accepted on Nov. 11.

During the last week's fighting the outbreak of the revolution in Germany, interrupting as it did the service of communication and the forwarding of supplies, had combined, with the pressure on the front, the depleted and disorganized condition of the troops, and the absence of any available reserves to replace broken and worn combat units, to render further resistance on the part of the Germans an impossibility. Had the Armistice not been concluded a great *débâcle* would have been the result.

Preparations had been made to extend the attack on Nov. 14 to include the Lorraine front E. of Metz, an attack which the German army was as little prepared to meet as it was to resist the advance of the whole Allied line to the north. But this proved unnecessary to secure the Allied war aims. (A. L. C.)

WESTER WEMYSS, ROSSLYN ERSKINE WEMYSS, 1ST BARON (1864-), British admiral, was born in London April 12 1864, the 3rd and posthumous son of James Hay Erskine Wemyss of Wemyss Castle, Fife. He entered the navy in 1877, was promoted lieutenant 1887, commander 1898, captain 1901, rear-admiral of 2nd Battle Squadron 1912–3, and of the 3rd fleet 1914, vice-admiral 1916 and admiral of the fleet 1919. He commanded a squadron during the landing of the British troops in Gallipoli (1915), was commander-in-chief in the East Indies and Egypt (1916–7), Second, and shortly afterward First Sea Lord of the Admiralty (1917–9), and member of the War Cabinet (1918). He was created K.C.B. (1916), G.C.B. (1918), and raised to the peerage (1919).

WEST INDIES, BRITISH (*see* 4.607* and separate articles on the various islands).—For administrative purposes, British Guiana and British Honduras are usually regarded as an integral part of the British West Indies, with which they have much in common. These two colonies are, therefore, included here. The area of the group remained unchanged in 1921, no new possessions having been acquired by Great Britain in the Caribbean and no territory alienated. The total pop., according to the latest estimates available in 1921, was:—Bahamas, 59,049; Barbados, 200,368; Jamaica, 891,040; Turks and Caicos Is., 5,615; Cayman Is., 5,564; Antigua, 32,865; St. Kitts, 22,415; Nevis, 11,596; Anguilla, 4,230; Dominica, 40,315; Montserrat, 10,182; Virgin Is., 5,557; Trinidad and Tobago, 386,707; Grenada, 74,490; St. Vincent, 53,210; St. Lucia, 51,505; British Guiana, 305,991; British Honduras, 43,586.

The Supply of Labour.—Though Barbados has a redundant population, the labour supply in the rest of the West Indies was insufficient for agricultural requirements, and the position had been aggravated by the emigration of British West Indians to Cuba, to which island they were tempted by the promise of higher wages, which did not, however, always materialize. Toward the end of 1919 this form of emigration began to assume serious proportions, no fewer than 21,573 labourers leaving Jamaica for Cuba, whilst only 6,457 returned. Recruiting for Cuba was also actively carried on in Barbados. With the slump in prices in 1921, however, the tide set in to some extent in the opposite direction, many labourers returning to their homes. In the British West Indies it was beginning to be realized that it is only by the payment of suitable wages, improved housing conditions and the offer of other amenities, that labourers can be induced to remain in their island homes. In British Guiana the shortage of labour was particularly acute, and with a population averaging only 3·3 to the square mile, no development of the hinterland on a large scale was possible.

In 1913, Mr. James McNeil and Mr. Chimman Lall visited the British West Indies to report on the system of indentured immigration prevailing in British Guiana, Jamaica and Trinidad, and though their report was favourable, Lord Hardinge, the then Viceroy of India, announced in the Indian Legislative Council in April 1916 the determination of the Government to abolish the indenture system. It was at first proposed to terminate the system gradually in order that the colonies might have time to adjust themselves to the change; but in practice emigration from India was completely suspended in the same year. In 1919, the need for labour having become acute in British Guiana, a deputation comprising representatives of all classes of the agricultural and commercial communities visited England to urge upon the India Office and leaders of Indian public opinion, who were then in London, the desirability of the resumption of Indian immigration on a free colonization basis. Representatives of the deputation and of the West India Committee subsequently visited India, where they interviewed prominent leaders and the members of the Government, who agreed to send a commission to British Guiana to report on the suitability of that country for receiving immigrants. The appointment of this commission was, however, delayed, it being felt desirable to await the views of the public in India regarding the proposals for dealing with the Indian question in Kenya Colony before proceeding further with the matter. In July 1921 an offer of the Indian Government to send a deputation to British Guiana was under consideration.

Government and Administration.—The question of political federation of these scattered colonies, which was discussed periodically, had failed up to 1921 to awaken any marked degree of enthusiasm in the several communities. Indications were not wanting, however, to show that a better understanding was being gradually brought about, in spite of the continued difficulties of communication. This was no doubt attributable to the work of a series of intercolonial conferences from 1899 to 1921, the main object of which had been to bring about a greater degree of uniformity in all matters of common interest concerning the British West Indies. All proved eminently successful, the Customs Conference in 1919, for example, having resulted in the adoption of uniformity of definition and arrangement of the West Indian tariffs, whilst the conference on law in 1916 was followed by the establishment of a West Indian court of appeal for the colonies lying to windward of the Caribbean. A further step in the direction of closer union has been the formation of an Associated West Indian Chamber of Commerce, which held conferences in Trinidad in 1917 and Barbados in 1920. In 1920–1 Grenada, St. Lucia, and St. Vincent individually petitioned the King for the substitution of representative government for the crown colony system. In the case of Grenada, the Secretary of State for the Colonies, to whom the matter was referred, consented to advise the King to approve of the introduction of the elective system into the constitution, the council to consist of the governor, as president, six official, three nominated unofficial and four elected unofficial members, the electives to be chosen by the people on the basis of the system of elected representation, already operative throughout the island in municipal affairs in the case of the district boards. The petitions of St. Lucia and St. Vincent, on the other hand, were rejected on the grounds that the signatories were not sufficiently representative in character.

In 1920 the Prince of Wales made Barbados his first port of call in his empire tour in H.M.S. "Renown," and visited in succession Trinidad, British Guiana, Grenada, St. Lucia, Dominica, Montserrat, Antigua and Bermuda on his homeward voyage. His Royal Highness, who was received with manifestations of the greatest loyalty wherever he went, took the opportunity of refuting the suggestion that Great Britain might be willing to dispose of her West Indian possessions to a foreign country in part settlement of her debt.

The World War.—The British West Indies contributed generously in men, money and produce toward the prosecution of the World War. Many hundreds of West Indians came over to England independently to enlist, and a contingent comprising 15,601 officers and men was recruited voluntarily for active service. The numbers of men recruited in the various islands, British Guiana and British Honduras, were:—

	Officers	Men
Barbados	20	811
Bahamas	2	439
British Guiana	14	686
British Honduras	5	528
Jamaica	303	9,977
Trinidad and Tobago	40	1,438
Grenada	4	441
St. Lucia	5	354
St. Vincent	..	305
The Leeward Is.	4	225
	397	15,204

The men were embodied in the British West Indies Regt., which served with distinction in France and Flanders, and also in Egypt and Palestine, where they participated in the victorious advance to 'Amman. The total casualties were: Killed or died of wounds, 185; died of sickness, 1,071; wounded, 697. Private contingents were also sent over for enlistment by the Trinidad Merchants' and Planters' Contingent Committee and the Barbados Citizens' Contingent Committee for recruitment in the United Kingdom. In order to provide for the welfare of the West India and Bermuda military contingents, and of men coming over independently to serve in His Majesty's forces during the war, the West Indian Contingent Committee was formed in London at the instance of Mr. Bonar Law, the then Secretary of State for the Colonies, in 1915. The total contributions made by the British West Indies toward the cost of the war, relief funds, etc., amounted to over £3,250,000, the most notable amount included in that figure being the annual contribution of £60,000 for 40 years voted by the Jamaica Legislature.

---

* *These figures indicate the volume and page number of the previous article.*

Trade.—The war brought about a remarkable revival of prosperity to the British West Indies, the total trade of those colonies rising from £25,809,884 in 1913 to £43,637,324 in 1919. The chief staples, sugar, rum, molasses, cacao, cotton and arrowroot, all commanded greatly enhanced prices, the only industry, indeed, that reaped no benefit being that of the production of lime and lime products in Dominica, which was adversely affected by the lack of shipping facilities and by import restrictions in the United States. Some anxiety was caused in 1912 by the decision of the Imperial Government to withdraw from the international convention for the suppression of sugar bounties and cartels, but the remaining high contracting Powers, having decided to adhere to that agreement, no ill effects resulted. Though Great Britain withdrew from the convention she decided to adhere to the principles of it and not to give a preference to sugar produced within the Empire or to cane over beet. In Aug. 1918 she gave to the signatories of the convention six months' notice of her intention to resume complete liberty of action in respect of her policy with regard to sugar, and the Finance Act of 1918 provided for the granting of a preference of one-sixth off the duties on sugar, molasses, tobacco, coffee, cacao and other products imported from within the Empire into the United Kingdom, and a preference of 2s. 6d. per gal. on rum.

Following an inquiry by a royal commission, of which the late Lord Balfour of Burleigh was chairman, in 1909, a conference was held at Ottawa in 1912 between representatives of the Dominion and the British West Indian colonies, the Bahamas, British Honduras and Jamaica excepted, to consider the question of closer trade between Canada and the West Indies, and on April 9 in that year an agreement was signed providing for a reciprocal trade agreement, the basis of which was a mutual preference of 20% on the chief products of the countries concerned, with a minimum preference on flour in favour of Canada, of 12 cents per 100 lb. and 15 cents on 96° test sugar not over No. 16 Dutch Standard in colour in favour of the British West Indies. Certain concessions which the Canadian refiners had enjoyed of importing foreign sugar at the British preferential rates were withdrawn. The agreement came into force on June 2 1913, and Grenada gave her adhesion to it in the same year.

In 1920 a further conference was held at Ottawa at which all the West Indian colonies, and also the Imperial Government, were represented. A new agreement was signed on June 18 1920 and brought into force in May 1921, under which Canada agreed to give to British West Indian products a tariff preference of 50%, whilst the British West Indies similarly agreed to extend to Canadian products tariff preferences of 50% in the case of Barbados, British Guiana and Trinidad, 33⅓% in that of British Honduras, the Leeward Is. and the Windward Is., 25% in Jamaica, and 10% in Bahamas, the Legislature of which colony afterwards voluntarily increased the preference to one of 25%. Certain products were again specifically dealt with, the preference on Canadian flour entering the West Indies being not less than 1s. per 196 lb. and that on West Indian sugar being not less than 83.712 cents per 100 lb. on 96° test. The Government of Canada further agreed to endeavour to arrange for a weekly freight, mail and passenger service, with steamers of 5,000 to 6,000 tons burthen, capable of steaming 12 knots per hour, between St. John (New Brunswick) or Halifax (Nova Scotia), down the islands lying to windward, British Guiana and back, the colonies contributing £27,000 per annum; also a service of freight, mail and passenger steamers of 3,500 tons burthen, capable of steaming 10 knots, from Canada to Nassau (Bahamas), Jamaica, Belize (British Honduras), and back, fortnightly, the colonies concerned contributing at the rate of £13,000 per annum toward any loss involved in the event of the service proving unremunerative. The Canada-British Honduras service was inaugurated in Jan. 1921. A declaration appended to the agreement recommended for favourable consideration the laying of British-owned and British-controlled cables as soon as possible, to connect Bermuda with Barbados, Trinidad, British Guiana, the Windward Is., the Leeward Is., and Turks Is. or Jamaica.

Communications.—In the matter of steamship communication the British West Indies were decidedly worse off after the war than before it. In 1915 the Royal Mail Steam Packet Co. terminated the transatlantic contract steamer service on the ground that they had been precluded from using their terminal port at Southampton. In the same year the fortnightly intercolonial contract service was also terminated by mutual agreement between the company and the colonies concerned. For some time thereafter the company continued to berth small passenger steamers for the West Indies at irregular intervals; but this service was also brought to an end in 1920, and passengers between the West Indies and the mother country were afterwards compelled to travel by foreign steamers, cargo boats, or *via* Canada or the United States. An intercolonial service was performed in 1921 by direct steamers running between St. John (New Brunswick) and Halifax (Nova Scotia), down the islands, and back. Under the Canada-West Indies trade agreement referred to above this service was to become a weekly one. The British Government, toward the close of the year 1920, agreed to contribute two-thirds of the cost of a temporary transatlantic steamer service for three months if the West Indian colonies would provide one-third, but this proposal was not acceptable to all the colonies concerned, mainly because it was felt that the steamers which it was proposed to use were unsuitable. In 1921 the British Government further offered to contribute £90,000 per annum toward a subsidy for a transatlantic steamer service, and proposals were made for the invitation of tenders. This proposal was, however, rejected by Trinidad, which in 1921 enjoyed a fortnightly mail and passenger service provided by the Royal Netherlands West India Mail, free of expense to the colony. The Dutch line agreed in June 1921 to allow their steamers to call at Barbados as well as Trinidad.

Agriculture.—In 1919 Visct. Milner appointed a committee to consider the desirability of establishing a tropical agricultural college in the West Indies, and in the event of their decision being favourable to report on the subject generally. The committee issued their report in 1920, favouring the establishment of a West Indian agricultural college in Trinidad. The proposals having commended themselves to the majority of the West Indian colonies, the agricultural college committee was called together again in the autumn of 1920 with a view to making the necessary arrangements for the incorporation of the college and for carrying out the plans generally. The objects for which the college was established are to afford to young men opportunities for instruction in the principles of agriculture and in the cultivation and preparation for market of tropical produce of every kind, including especially sugar and its by-products, rum and molasses, cacao, coffee, cotton, coco-nuts, rice, citrus and other fruits (notably bananas), and dyewoods, many of which commodities constitute the raw materials employed in the manufactures of the mother country; for the training of scientific investigators in matters pertaining to tropical agriculture amid suitable surroundings; for creating a body of British expert agriculturists well versed in the knowledge of the cultivation of land in the tropics, and of scientific advisers possessing an intimate knowledge of the means of combating pests and diseases, the control of which is fundamentally essential to the successful development of agriculture in the tropics. Attached to the college will be a model sugar factory, the various units of which have been contributed by the principal British sugar machinery manufacturing and allied firms.

Industries.—Sugar remained the principal staple. This industry was developed by the extension of the central factory system, whereby the canes from the surrounding estates, as well as those grown by peasant farmers, are dealt with at a central base, the concentration thus effected permitting of the instalment of machinery by which the maximum amount of sugar can be extracted from the cane. Thanks to the devoted care given to cultivation, and to the assistance of the local agricultural scientists who make it their constant aim to combat insect pests, the cacao industry, which is mainly centred in Trinidad and Grenada, continued to prosper. The Jamaica banana industry suffered from a succession of hurricanes in 1915, 1916 and 1917, but afterwards showed rapid recovery. The cultivation of citrus fruit on the other hand made little progress—except in Dominica, where the lime industry continued steadily to increase after the war—owing to the prohibitive import duties in the United States and the inadequacy of shipping facilities for fruit between the West Indies and Canada and the United Kingdom. The Sea Island cotton industry, which owed its development in the West Indies to the ravages of the boll-weevil in the United States, received a check in 1920, through the appearance of the still more dreaded boll-worm in St. Kitts and Montserrat, to which it was brought by a Brazilian vessel. A comparatively new industry, which made rapid progress, was that of rice. Formerly rice was imported into British Guiana in large quantities for the consumption of East Indian immigrants. Now that colony not only produces enough rice for its own requirements but also a substantial surplus which is available for export to the neighbouring colonies. The exports of rice from British Guiana rose from 45,223 lb. in 1905 to 18,110,400 lb., besides 4,390,051 lb. of paddy, in 1920.

Almost as rapid has been the development of the petroleum industry in Trinidad. The existence of petroleum deposits in Trinidad has long been recognized. As far back as 1864 the Trinidad Petroleum Co., promoted by Mr. H. B. Sheridan and the 11th Earl of Dundonald, started drilling for oil at La Brea. Oil was struck, but competition with the new oilfields in the United States proved too formidable, and this and other causes forced the company into liquidation. Two years later, a civil engineer, named Derwent, started boring at Aripero. He, too, struck oil, but failed to make a financial success of the venture. No further steps were taken toward winning oil until about 1900, when Mr. Randolph Rust, a local resident (Mayor of Port of Spain in 1921), imported modern oil-boring machinery and successfully struck oil at Aripero in 1901. Other prospectors came on the scene, and in 1910 followed the successful flotation of the Trinidad oilfields, and Trinidad enjoyed such a boom as no West Indian colony had experienced, at any rate for many a long day. On April 27 in the following year Sir George Le Hunte, the then governor, opened the valve at the end of the pipe line on Brighton pier, thus inaugurating the new industry, which has since been developed at a rapid rate. With many new wells being drilled it was certain that the production of oil, which in 1920 amounted to 72,905,947 gal., would undergo material expansion. (A. E. A.)

WESTINGHOUSE, GEORGE (1846–1914), American inventor and manufacturer, was born at Central Bridge, N.Y., Oct. 6 1846. In 1856 his father moved to Schenectady, N.Y., and began to manufacture farm implements. The boy early displayed inventive talent and when 15 designed and constructed a rotary engine. He entered the Union army in the Civil War in 1863 but in 1864 was appointed third assistant engineer in the navy. At the close of the war he resigned and entered Union College, but in his sophomore year, on the advice of the president, he withdrew to devote his time to mechanical invention. In 1865 he had invented a device for replacing derailed cars and also a reversible steel railway frog, but from lack of capital was unable to develop a business in Schenectady. In 1868 he went to Pittsburgh and arranged for the manufacture of his devices, which he himself sold to the railways. In 1869 he patented his air-brake and organized the Westinghouse Air Brake Co. In 1872 he invented the automatic air-brake (*see* 4.414). This brake was quickly adopted by railways in America and gradually in Europe. He also developed a system of railway signals, operated by compressed air with the assistance of electrical contrivances. In 1885 he acquired certain patents for alternating current machinery. In June 1912 he received the Edison gold medal for "meritorious achievement in connexion with the development of the alternating current system for light and power." In 1893 this system was installed at the Chicago Exposition. Later his Pittsburgh establishment built dynamos for the power plants at Niagara Falls, for the rapid transit systems of New York City, and for the London Metropolitan railway. Westinghouse also devised a method for conveying gas through long-distance pipes thus making it a practicable fuel. In 1910 he was elected president of the American Society of Mechanical Engineers. He died in New York March 12 1914. He was president of some 30 corporations with a capital of about $200,000,000, employing more than 50,000 persons.

WESTLAKE, JOHN (1828–1913), English jurist, was born at Lostwithiel, Cornwall, Feb. 4 1828. He was educated at Trinity College, Cambridge, where he graduated in 1850. He was called to the bar in 1854, and attained a great reputation as an authority on international law. In 1874 he became a Q.C. and bencher of Lincoln's Inn, and in 1885 successfully contested the Romford division of Essex in the Liberal interest. In 1888 he became professor of international law at the university of Cambridge, a position which he held until 1908. He was also an hon. president of the Institute of International Law, and from 1900 to 1906 a member of the Hague arbitration court. He died at Chelsea April 14 1913.

His works include *A Treatise on Private International Law, or the Conflict of Laws* (1858; 5th ed. 1912); *Chapters on the Principles of International Law* (1894); *International Law*, Part I., *Peace* (1904; 2nd ed. 1910); Part II., *War* (1907).

WESTON, AGNES (1840–1918), English philanthropic worker, was born in London March 26 1840. In 1868 she took up hospital visiting and parish work in Bath, and through beginning a correspondence with a seaman who asked her to write to him, developed into the devoted friend of sailors, superintendent of the Royal Naval Temperance Society and founder of the Royal Naval Sailors' Rests, or clubs for sailors, at Devonport and Portsmouth. She published *Life Among the Bluejackets* in 1909. She died at Devonport Oct. 23 1918. Shortly before her death her work for the navy had been recognized by the bestowal of the G.B.E.

See S. G. Wintz, *Our Bluejackets, Miss Weston's Work* (1894).

WEST POINT (*see* 28.558).—The following important buildings were completed at West Point after 1910: the Administration Building, East Academic Building, Riding Hall, two new cadet barracks, cadet chapel and chaplain's quarters, artillery barracks and artillery stable, cavalry barracks and cavalry stable, eight sets of officers' quarters, two apartment buildings each containing eight sets of officers' quarters, and a cadet laundry. By Act of May 4 1916, the number of cadetships authorized at the academy was increased to 1,332. By authority of the War Department, April 1915, candidates were permitted, in lieu of passing the regular entrance examination, to qualify for admission upon the presentation of satisfactory certificate of previous academic work in accredited institutions. By Acts of 1919 and 1920, the pay of cadets was fixed at $780 per annum and one ration per day or commutation thereof at the rate of $1.08 per day. The World War and the demand for trained officers led the War Department to direct the graduation of the First or Upper Class April 20 1917, and of the Second Class Aug. 30 1917. The next year the need for officers resulted in the graduation of three classes, the first, June 12 1918, and the second and third together, Nov. 1 1918. A class of new cadets was admitted at an irregular time, Nov. 2 1918, and provision was made for a temporary one-year course. After the Armistice the War Department directed, May 12 1919, that the course of instruction be fixed for three years, but the following year Congress specified that the course should be four years. The academic authorities thereupon reorganized the curriculum in the light of the most recent military and educational experience.

The new schedule contained the following salient features: (1) The upper classes on duty undergo military training June 15 to Aug. 30 at a regular army cantonment away from West Point; (2) The new Fourth Class enter the academy July 1 and receive at West Point preliminary military training until Aug. 30; (3) During the academic year, extending from Sept. 1 to June 15, tactical drills and supervised athletics alternate daily (except Wednesdays and Saturdays) after 4 P.M. for all cadets; (4) Academic instruction be given during periods between 8 A.M. and 4 P.M. in the following subjects to the respective classes—*Fourth Class*, mathematics, English, French and surveying; *Third Class*, mathematics, English, French, political history, drawing and theoretical tactics; *Second Class*, natural and experimental philosophy, chemistry and electricity, Spanish, military hygiene; *First Class*, military engineering, law, military art and history, ordnance and gunnery, economics and government. Ten Saturdays throughout the year were set apart for lectures to the whole corps by eminent men.

The number of graduates of the academy 1910 to 1920 inclusive was 1,959. The superintendents since 1910 have been: T. H. Barry (b. 1855) 1910–2; C. P. Townsley (b. 1855) 1912–5; John Biddle (b. 1859) 1916–7; S. E. Tillman (b. 1847) 1917–9; Douglas McArthur (b. 1880) 1919–22. (L. H. H.*)

WEST VIRGINIA (*see* 28.560).—In 1920 the pop. was 1,463,701, as against 1,221,119 in 1910, an increase of 242,582 or 19·9%. The urban pop. (for places of 2,500 or more) increased from 18·7% in 1910 to 25·2% in 1920. The density of pop. was 60·9 in 1920; 50·8 in 1910. The following table shows the growth of the ten largest cities for the decade 1910–20:—

	1920	1910	Percentage increase
Wheeling	56,208	41,641	34·9
Huntington	50,177	31,161	61·0
Charleston	39,608	22,996	72·2
Clarksburg	27,869	9,201	202·9
Parkersburg	20,050	17,842	12·4
Fairmont	17,851	9,711	83·8
Bluefield	15,282	11,188	36·6
Martinsburg	12,515	10,698	17·0
Morgantown	12,127	9,150	35·5

Agriculture.—Of the land area of the state 62·2% in 1920 was in farms and 57·7% was improved. The number of farms, which was 96,685 in 1910, decreased to 87,289 in 1920 (9·7%). The total farm acreage decreased from 10,026,442 to 9,569,790 (4·6%), but the total value of all farm property increased from $314,738,540 in 1910 to $496,439,617 in 1920 (57·7%). The value of farm lands and buildings increased from $264,390,954 to $410,783,406; implements and machinery from $7,011,513 to $18,395,058; and live stock from $43,336,073 to $67,261,153. The number of farms reported as being mortgaged grew from 9,525 in 1910 to 10,274 in 1920. Of these 7,878 in 1910 and 9,031 in 1920 reported the amounts represented by the mortgages—$5,592,533 and $11,205,953 respectively. The average debt per mortgaged farm was $1,241 in 1920 and the average rate of interest 5·9%. Native-born white farmers predominate in the state. Of the 87,289 farms in the state in 1920 86,785 were operated by white farmers, of whom only 752 were foreign-born, and there were only 504 coloured farmers, compared with 708 in 1910. Of the native white farmers 71,181 were owners, 1,071 managers and 13,781 tenants. The number of horses on farms in 1920 was 169,148, compared with 176,530 in 1910. Mules increased from 11,577 to 14,981; cattle from 560,770 to 587,462; and chickens from 3,106,907 to 4,027,510; while sheep decreased from 566,952 to 509,831; and hives of bees from 111,673 to 89,873.

The value of all crops for West Virginia in 1919 was $96,537,459, compared with $36,167,014 in 1909. The 1919 value of the corn crop was $29,768,131; oats $3,054,668; wheat $8,395,097; hay and forage $23,746,574; potatoes $6,461,619; tobacco $2,731,338; apples $7,540,491; peaches $1,518,784. The variations in production of the chief crops in 1909 and 1919 is shown in the following table:—

	1919		1909	
	Ac.	Bus.	Ac.	Bus.
Corn	568,219	17,010,357	676,311	17,119,097
Oats	169,915	3,054,668	103,758	1,728,806
Wheat . . .	298,036	3,747,812	209,315	2,575,996
Buckwheat . .	31,095	537,883	33,323	533,670
Potatoes . . .	34,526	2,809,398	42,621	4,077,066

The extension of agricultural teaching, which was established at the West Virginia University in 1913, has been an important factor in the development of scientific agricultural methods.

Mining.—In mineral productions West Virginia ranks second among the states of the Union. The total value was $125,111,280 in 1913 and $133,633,229 in 1914. Oil production, which in 1900 was 16,195,675 bar., declined to 9,095,296 in 1907. It increased again to 12,128,962 bar. in 1912, but steadily declined thereafter. The production in 1916 was 8,731,184 bar., valued at $21,914,080. In 1918 it was only 7,866,628 bar. (the lowest since 1893), but in 1920 it reached 8,173,000 barrels. In the production of natural gas West Virginia since 1906 has ranked first among all the states. The production, which had reached 119,100,392 thousand cub. ft. in 1906, steadily increased (except in 1908 and 1914) to 308,617,101 thousand cub. ft., (valued at $57,389,161) in 1917; but in 1918 declined to 265,160,917 thousand (valued at $41,324,365), and in 1919 to approximately 201,500,000 thousand (valued at $40,304,500).

In 1909 West Virginia, overtaking Illinois, became the second coal-producing state of the Union, but in 1920 dropped to third. Coal production in West Virginia, which had reached 22,647,207 short (net) tons in 1900, and 61,671,019 in 1910, continued to increase steadily, reaching in 1914 71,707,626 short tons, valued at $71,391,408, and furnishing employment to 78,363 persons. The industry became especially active when the United States entered the World War. In 1916 the production increased to 86,460,127 short tons, valued at $102,366,092, and in 1918 to 89,935,839 short tons, valued at $230,508,846. In 1919 it was 75,500,000 short tons, and, together with coke production 1,454,000 short tons, gave employment to 91,566 persons. In 1920 it was 87,500,000 tons. The production of coke, which steadily increased until 1910, when it reached 14,217,380 short tons, valued at $7,525,922, thereafter steadily diminished to 1,391,446 short tons in 1915, again increased to 3,349,761 in 1917, and in 1919 decreased to 1,454,000 short tons. The increase of coal production after 1910 was partly due to strikes in Ohio and other middle-western states. The determination of the United Mine Workers to unionize the mines of West Virginia led to a bitter and prolonged labour war, which began in 1912 in the Cabin Creek and Paint Creek collieries of the Kanawha valley, and resulted in losses aggregating nearly $6,000,000. This secured for the union a foothold in West Virginia. In Sept. and Nov. 1919 organized miners from the Kanawha region threatened an armed invasion of Logan County to force the unionization of that field. In order to prevent possible disturbance Gov. Cornwell asked for and obtained a regiment of Federal troops. In 1920 an attempt to unionize the miners along the Norfolk & Western railway finally precipitated an armed conflict between detectives and union miners at Matewan, in Mingo county, resulting in the death of seven detectives and the mayor and the terrorization of the community, and necessitating a call for Federal troops and the establishment of military control.

Manufactures.—In 1914 West Virginia was in importance of manufactures the 28th state. The number of establishments was 2,749, with an invested capital of $175,995,011, and a production valued at $193,511,782. The number of persons employed was 79,353 (11% more than 1909), earning $51,377,760. The leading industries were lumber and timber, steelworks, rolling-mills, tinplate and terneplate, glass, leather, railway cars and shop construction, flour milling and the manufacturing of clay products. The state ranked second in the production of glass, and also in the production of tinplate and terneplate, and eighth in the value of clay products. The Federal Government constructed on the Kanawha in 1918 two large plants, a projectile plant at Charleston and a high-explosive plant at Nitro, at an expenditure of over $60,000,000.

Transportation.—Transportation facilities continued to improve after 1909. The railway mileage, which in 1912 reached 3,557 m. by the completion of the Virginia railway (139·6 m.), by the construction of the coal and coke railway from Elkins to Charleston (196·75 m., recently acquired by the Baltimore & Ohio Railway Co.), and by the completion of the Hampshire-Southern branch of the Baltimore & Ohio to Moorefield and Petersburg, was further increased in 1913 by the extension of the Monongahela River railway southward to Fairmont (1913) and by several shorter branches. The railway mileage in 1919 was 3,892.

Banks and Banking.—The condition of the banks in West Virginia in 1920–1 was as follows:—

	National Banks, 1920	State Banks, 1920–1
Number . . .	122	227
Capital . . .	$11,573,000	$17,597,932
Surplus . . .	$7,739,000	$11,047,231
Loans . . .	$100,545,000	$150,617,886
Deposits . . .	$134,436,000	$170,370,924

Education.—In 1920 the total school pop. was 448,670, the total school enrolment 341,977, the average daily attendance 253,395. The *per capita* cost of education was $25.18 based on enumeration, $44.57 based on average daily attendance. The total number of teachers was 11,406. The average annual salary paid teachers in all grades was $581. The total number of school-houses was 6,956. The expenditure for all common schools was $11,291,563 and for state educational institutions $1,850,906, making a total of $13,141,469 for the educational system of the state. The value of all public school property was estimated at $25,639,697, and the value of state educational institutions at $2,775,000. In 1920 a compulsory school law was enacted. The development of the high schools has been a prominent feature of recent educational growth. This was partly due to the appointment of a state high school supervisor in 1909 to direct the establishment and standardization of the high schools. In 1921 the state had 172 classified high schools with 1,129 teachers, and an enrolment of 20,000 (about 3,000 graduating each year), and high school property valued at $10,000,000. In 1920 the high schools received state aid amounting to $118,000. The enrolment of candidates for degrees in West Virginia University increased from 800 in 1909–10 to 1,596 in 1919–20, and the total enrolment for the same period increased from 1,200 to 2,800, or 1,992 exclusive of short-course students. The members of the faculty increased from 62 to 141, of whom 56 were full professors, 17 were associate professors and 27 were assistant professors. The total number of women students increased from 619 to 975 in the same period. Under the Act of 1919 the control of all educational affairs of the state, from the lowest school to the university, was vested in a state board of education composed of the state superintendent (as executive officer) and six members appointed by the governor. The board has an advisory council of three coloured citizens.

Finance.—The receipts of the state for the fiscal year June 30 1920 was $19,901,931, the disbursements $19,570,122. The total bonded indebtedness Jan. 1 1921 was $11,663,700. In 1919 the total assessed value of real estate ($769,648,033), personal property ($371,602,428) and public utility property ($349,522,672) was $1,490,773,133. In 1909 the Legislature enacted a business licence tax which by July 1920 produced $226,204. In 1915 it placed on corporations and companies a special excise tax, which was increased by an additional excise tax in 1919. The two Acts produced for 1919–20 approximately $600,000.

Constitutional Amendments.—An amendment providing for prohibition was ratified in 1912 by a majority of 92,342. Another amendment proposed in 1917 and ratified in Nov. 1918 provides that an itemized and classified budget shall be prepared by the board of public works, and presented to the Legislature for its guidance in determining appropriations. A third amendment ratified in Nov. 1920 provided for two periods of every regular session of the Legislature—one of 15 days in Jan., primarily for presentation of bills, and another of 45 days in March–April, primarily for consideration and action on bills. The same amendment increased the salaries of members of the Legislature to $500 a year. A fourth amendment, ratified in Nov. 1920, authorized the Legislature to provide for a system of state roads under control and supervision of state officers, and to bond the state to a maximum of $50,000,000, if necessary.

Administrative Changes.—By Act of 1911 a state Department of Agriculture was created in 1913 and placed under the Direction of the commissioner of agriculture, an elective officer who is also a member of the board of public works. The office of highway inspector, created in 1907, was abolished in 1911; and a state bureau of roads (four members) was created in 1913. By Act of 1913 a public service commission of four members (reduced to three by Act of 1915) was created. At first it had jurisdiction over the newly established workmen's compensation fund, which later was administered by a state commissioner. Under the Yost law of 1913 the state tax commissioner is *ex officio* state commissioner of prohibition.

By Act of 1919 a department of public safety (state police) was established to relieve the military arm of the state and to aid in establishing the system of private peace officers. By Act of 1915 the membership of the House of Delegates (previously 86) was increased to 94.

Welfare Legislation.—A state tuberculosis sanatorium established by Act of 1911 was opened for patients in 1913 at Terra Alta. A similar institution for coloured people was opened in 1919. Revision of laws relating to medicine and health in 1913 marked the beginning of a new era in sanitary legislation. In 1914 a hygiene laboratory was established. In 1915 a state department of health was created, with a commissioner as executive officer, two new divisions, vital statistics and child welfare, were added by Act of 1919.

History.—Apart from the economic and educational movements above described, the outstanding event of the decade ending 1920 was the adjustment of the long-standing "Virginia debt question." It arose from the formation of West Virginia as a separate state in 1863 and at various times had been a prominent issue in state politics. A U.S. Supreme Court decision of 1911 tentatively fixed West Virginia's share of the old debt at $7,182,507.48 (leaving the question of interest for later adjustment), and by a later judgment of 1915 against West Virginia fixed the total obligations at $12,393,929.50 ($4,215,622.28 and accrued interest from Jan. 1 1861), with a decree that this total amount should draw interest at 5% until paid. In Feb. 1917 Virginia filed application for a writ of *mandamus* against the Legislature of West Virginia to compel the levy of a tax to pay the judgment; but the court deferred action in order to give West Virginia a reasonable opportunity to act without compulsion. The total amount of principal and interest on Jan. 1 1919 was $14,562,867.16. Of this amount West Virginia, by Act of March 31 1919, arranged to pay $1,062,867.16 in cash and the balance by an issue of "listable" 3½% bonds in favour of Virginia, payable in 1939 (or earlier). Bonds amounting to $12,366,500 were delivered to the Virginia debt commission at Richmond, Va., on July 3 1919. The remaining bonds ($1,133,500) were held in escrow pending the filing of remaining outstanding Virginia debt certificates.

The state continued Republican in politics, but party division resulted in the election of a Democrat to the governor's office in 1916. The governors since 1909 have been: William E. Glasscock, 1909–13; Henry D. Hatfield, 1913–7; John J. Cornwell, 1917–21; Ephraim F. Morgan, 1921– .

WHARTON, EDITH [Newbold Jones] (1862–), American writer, was born in New York City in 1862. She lived much in Italy and France. She married Edward Wharton, a Boston banker, in 1885. She began her literary career as a writer of short stories, her first story, "Mrs. Manstey's View," appearing in *Scribner's Magazine* in 1891. Her first long novel, *The Valley of Decision,* appeared in 1902, the scene being Italy toward the close of the seventeenth century. Her novel, *The House of Mirth,* appeared in 1905 and was highly successful. In 1908 it was translated into French by Paul Bourget, who called it the greatest American novel. It was dramatized with the help of Clyde Fitch, but had slight success. After the outbreak of the World War she edited in 1915 *The Book of the Homeless,* sold for the benefit of Belgian refugees; and later for services she was made a chevalier of the Legion of Honour of France. Her works include *The Greater Inclination* (1899); *The Touchstone* (1900); *Crucial Instances* (1901); *Madame de Treymes* (1907); *The Fruit of the Tree* (1907); *The Hermit and the Wild Woman* (1908); *Tales of Men and Ghosts* (1910); *Ethan Frome* (1911); *The Custom of the Country* (1913); *The Age of Innocence* (1920).

WHITBREAD, SAMUEL (1830–1915), English politician, was born at Cardington, Beds., May 5 1830, the son of Samuel Charles Whitbread, M.P. for Middlesex and grandson of Samuel Whitbread, M.P. for Beds. (*see* 28.597). He carried on the family tradition both in brewing and in politics, controlling the brewery founded by his great-grandfather from 1867 to 1889, and then becoming chairman of the company to which it was transferred. Like his father and grandfather he sat in the House of Commons as a Liberal, representing Bedford from 1852 to 1895. He died at Biggleswade Dec. 25 1915.

WHITE, ANDREW DICKSON (1832–1918), American educationalist (*see* 28.599), died at Ithaca, N.Y., Nov. 4 1918. His later works included *Seven Great Statesmen in the Warfare of Humanity With Unreason* (1910) and *The Work of Benjamin Hale* (1911). In 1913 he published a new edition of *The Warfare of Science and Theology in Christendom.*

WHITE, EDWARD DOUGLASS (1845–1921), American jurist, was born on a plantation in the parish of Lafourche, La., Nov. 3 1845. His father was seventh governor of Louisiana. He was educated at Mount St. Mary's, Md., Georgetown (D.C.) College, and, after the outbreak of the Civil War, at the Jesuit College in New Orleans. During the latter part of the war he served as a private in the Confederate army. He studied law in the office of Edward Bermudez, later chief justice of Louisiana, was admitted to the bar in 1868, and practised law in New Orleans. In 1874 he was elected to the state Senate, and four years later was appointed associate justice of the Louisiana Supreme Court. In 1891 he was elected to the U.S. Senate, and before completing his term was appointed, in 1894, associate justice of the U.S. Supreme Court by President Cleveland. In 1910 he was appointed chief justice by President Taft. Many of his notable opinions were delivered in connexion with the Sherman anti-trust law. Of special importance were his opinions requiring the dissolution of the Standard Oil Co. and the American Tobacco Co. in 1911. As chief justice he administered the oath of office to President Wilson in 1913 and 1917, and to President Harding in 1921. He died at Washington, D.C., May 19 1921.

WHITE, SIR GEORGE STUART (1835–1912), British field-marshal (*see* 28.599), died in London June 24 1912.

WHITE, SIR WILLIAM HENRY (1845–1913), English naval architect (*see* 28.602), died in London Feb. 27 1913.

WHITEAVES, JOSEPH FREDERICK (1835–1909), British palaeontologist (*see* 28.602), died at Ottawa Aug. 9 1909.

WHITLOCK, BRAND (1869–), American diplomat and writer, was born at Urbana, O., Mar. 4 1869. He was educated in the public schools, became a newspaper reporter in Toledo, O., in 1887, and was appointed political correspondent on the Chicago *Herald* in 1890. Three years later he accepted a clerkship in the office of the Secretary of State of Illinois, where he remained until 1897. Meanwhile he read law and was admitted to the bar (1894). In 1897 he returned to Toledo and practised law until 1905, when he was elected mayor. He was reëlected for three succeeding terms, but in 1911 declined the nomination for a fifth term. In 1913 he was appointed by President Wilson minister to Belgium and in 1919 his post was raised to ambassador. This office he continued to hold under President Harding until the close of 1921. Before he had been in Belgium a year the World War broke out and the German invasion took place. Although the other diplomatic bodies followed the Belgian court to Havre, Whitlock insisted on remaining in Brussels in order to render any possible aid to the oppressed people. It was largely due to his urgent advice that Brussels did not resist and thus escaped even more ruthless devastation. In the early days of the war he gave protection to many German residents who had been unable to leave the country. By his firm attitude toward the German military officials he saved many innocent Belgians from death; but his activities in behalf of Edith Cavell were unavailing as he was misled at the last moment by false promises by the Germans. After the formation of the Commission for Relief in Belgium, its operations were placed wholly under his direction. Food and clothing were provided for destitute civilians whose means of sustenance had been destroyed. His ceaseless work in their behalf won the gratitude of all the Belgians; and although worn out by the physical strain he refused to quit his post until the signing of the Armistice in Nov. 1918, when he returned to America for a short rest. He was decorated with the Grand Cordon of the Order of Leopold by King Albert (1917), and was made burgher of Brussels (1918) and of Liége (1919) and Honorary Citizen of Antwerp (1919).

The Belgian Government awarded him the Civic Cross of the First Class (1919). He was elected a member of the American Academy of Arts and Letters.

An excellent account of the German occupation is given in his *Belgium; a Personal Narrative* (1919). His other writings include *The 13th District: a Story of a Candidate* (1902); *Her Infinite Variety* (1904); *The Happy Average* (1904); *The Turn of the Balance* (1907); *Abraham Lincoln* (1909, in the *Beacon Biographies*); *The Gold Brick* (1910); *On the Enforcement of Law in Cities* (1910; enlarged form, 1913); *The Fall Guy* (1912); *Forty Years of It* (1914, a description of "democracy's progress in a mid-western city") and *Walt Whitman: How to Know Him* (1920).

WHYMPER, EDWARD (1840–1911), British explorer and mountaineer (*see* 28.617), died at Chamonix Sept. 16 1911.

WHYTE, ALEXANDER (1837–1921), British divine (*see* 28.617), retired from the ministry of Free St. George's in 1916, and from his position as principal of New College, Edinburgh, in 1918. He published *The Apostle Paul* (1903) and *Thirteen Appreciations* (1915). He died at Hampstead Jan. 6 1921.

WILBERFORCE, ALBERT BASIL ORME (1841–1916), English divine (*see* 28.630), died May 13 1916.

WILBRANDT, ADOLF (1837–1911), German novelist and dramatist (*see* 28.631), died at Rostock June 10 1911.

See E. Scharrer-Santen, *Adolf Wilbrandt als Dramatiker* (1912), and *Jahrbuch und Deutscher Nekrolog*, XVI., Totenliste 1911, p. 84.

WILEY, HARVEY WASHINGTON (1844–), American chemist, was born in Kent, Ind., Oct. 18 1844. He was educated at Hanover (Ind.) College (A.B.1867; A.M.1870), Indiana Medical College (M.D.1871), and Harvard (B.S.1873). He was professor of Greek and Latin at Butler College, Indianapolis, (1868–70); state chemist of Indiana and professor of Chemistry at Purdue University (1874-83); and chief chemist of the U.S. Department of Agriculture (1883–1912). He was elected president of the American Chemical Society in 1893, and from 1899 was professor of Agricultural Chemistry at the George Washington University. He frequently represented the United States in scientific meetings abroad. He was specially interested in preventing food adulteration, and antagonized many food packers by opposing the use of benzoate of soda as a preservative. In 1911 his enemies urged his dismissal from the Department of Agriculture on the technical charge that an expert in his department had received recompense exceeding the legal rate. Later in the year President Taft wrote a letter wholly exonerating Dr. Wiley, but failed to take the obviously proper steps to remove from the Department a hostile member, with whom Dr. Wiley had to come into constant contact. Accordingly, Dr. Wiley resigned in 1912. Henceforth, he devoted himself largely to the cause of pure food by lecturing and writing.

His numerous publications include *The Sugar Industry of the United States* (1885); *Principles and Practice of Agricultural Analysis* (1894–7; revised edition, 1906–14); *Foods and Their Adulterations* (1907; third edition, 1917); *Influence of Food Preservatives and Artificial Colors on Digestion and Health* (1904–7, with several collaborators); *1001 Tests of Foods, Beverages, and Toilet Accessories, Good and Otherwise* (1914); *The Lure of the Land* (1915), and *Beverages and Their Adulteration* (1919). He also edited a series of *Health Readers for Schools* in 1919.

WILLARD, DANIEL (1861–), American railway official, was born at North Hartland, Vt., Jan. 28 1861. He graduated from the Windsor (Vt.) high school in 1878, studied for a year at the Mass. Agricultural College, Amherst, and in 1879 began his railway career as track labourer in Vermont. He rose to fireman, then to engineer, and for twenty years held various positions on several roads, including the Minneapolis, St. Paul and Sault Ste. Marie in its early days. In 1899 he was made assistant manager of the Baltimore and Ohio R.R., and two years later assistant to the president of the Erie R.R., of which he soon became first vice-president and general manager. From 1904 to 1910 he was second vice-president of the Chicago, Burlington and Quincy R.R., and after 1909 was also president of the Colorado Midland and vice-president of the Colorado and Southern. In 1910 he was elected president of the Baltimore and Ohio. In Oct. 1916 he was appointed a member of the Advisory Commission of the Council of National Defense, and the following March chairman of the commission. After America's entrance into the World War, he was appointed in July 1917 a member of the special committee of the Council of National Defense to secure mediation in case of strikes on war contracts. In Nov. 1917 he was appointed by President Wilson chairman of the War Industries Board, charged with devising and expediting means of producing the Government's industrial requirements for effective warfare. In Jan. 1918 he resigned in order to devote personal attention to the Baltimore and Ohio Railroad. After the Government had taken over the railways as a war measure a Federal manager displaced him as operating head of his road, but he remained president in charge of its corporate affairs, in which position he continued when the U.S. Government gave up control of the railways.

WILLARD, EDWARD SMITH (1853–1915), British actor, was born at Brighton Jan. 9 1853 and first appeared in *The Lady of Lyons* at Weymouth at the age of sixteen. He toured first with E. H. Sothern and then joined various stock companies, coming to London in 1875 and playing Antonio in *The Merchant of Venice* with Charles Rice in 1876. After a varied experience in Shakespearean and other plays he was engaged by Wilson Barrett in 1881 for the Princess's theatre, London, and until 1886 played leading parts in many melodramas, the most notable amongst them being "The Spider" in Henry Arthur Jones's *The Silver King*. In 1889 he produced Jones's *The Middleman* at the Shaftesbury theatre, London, afterward taking it to America. He played Professor Goodwillie in Barrie's *The Professor's Love Story* in 1894 at the Comedy theatre, London. After 1903 he acted only in America, repeating these and other roles; but in 1911 he played Brutus at the Gala performance of scenes from Julius Caesar at His Majesty's theatre, London. He died in London Nov. 9 1915.

WILLCOCKS, SIR WILLIAM (1852–), British engineer, was born in India in 1852 and educated at Roorkee College, India. From 1872 to 1897 he was engaged successively in the Indian and Egyptian Public Works Departments. He designed and carried through the Assuan Dam in 1898, and for this work the C.M.G. was conferred upon him, followed by the K.C.M.G. in 1902. His most important undertaking, however, was the irrigation of Mesopotamia, begun in 1911 at an estimated cost of £26,195,000. The scheme provided for the irrigation of 3,500,000 acres. His published works include *Egyptian Irrigation* (1889); *The Irrigation of Mesopotamia* (1905) and *From the Garden of Eden to the Crossing of the Jordan* (1918). In Jan. 1921 he was put on trial before the Supreme Consular Court of Egypt on a charge of sedition and criminal libel, on account of statements made by him impugning the trustworthiness of the data concerning the Nile irrigation published by Sir Murdoch Macdonald, adviser of the Egyptian Ministry of Public Works. He was found guilty March 11, and on April 16 he was bound over to be of good behaviour for one year.

WILLETT, WILLIAM (1856–1915), English builder, was born at Farnham, Surrey, in Sept. 1856. He made a name for himself in London as a designer of beautiful houses; but his chief claim to fame was his conception and promotion of the system of "daylight saving." Though scoffed at in his lifetime, his idea was taken up and put into practice in 1916, and honour has been paid to Willett's memory, which was denied to him in life. He died at Chislehurst March 4 1915.

WILLIAM II. OF HOHENZOLLERN (1859–), German ex-Emperor and ex-King of Prussia (*see* 28.667). When the hour of the downfall of the German Empire and the Prussian dynasty, following upon the military collapse of Germany, arrived in Nov. 1918, the ex-Emperor's flight to Holland bore in the eyes of his countrymen the aspect of a pitiable incident, rather than of a tragic climax. For a considerable portion of the rest of the world, which had frequently overestimated his personal, as distinguished from his official, significance, his conduct and bearing on the eve of the war, throughout its course, and at the moment of his country's disaster, may indeed have come as something of a revelation. There followed a series of disclosures as to his exploits in previous years, above all that piece of personal diplomacy, the Treaty into which he tricked the still more inadequate Emperor of Russia at their meeting at Björkö on the Russian Imperial yacht (July 23, 24, 1905), and the equally characteristic "Willy-Nicky" correspondence (mainly in 1904–5), so-called on account of the signatures which the two Imperial correspondents appended to their letters. Only the Kaiser's share in that correspondence has (1920) been published.

The Björkö Treaty, which was signed by the Tsar without consultation with the minister responsible for the foreign policy of Russia, represented an attempt by William II. to imitate Bismarck's Treaty of Reinsurance with Russia (1887–1890), which the great Chancellor had concluded behind the back of his ally Austria-Hungary, and which was allowed by his successor, Caprivi, to lapse in 1890 as being "too complicated"—*i.e.* too full of duplicity.

In William II.'s Treaty of Björkö, Russia and Germany engaged "to make foreign disturbers of the peace quiet, and in case of necessity to stand by one another with their armed strength." Count Lamsdorff, then Russian Minister for Foreign Affairs, was "profoundly excited and upset" when he read the document, since, as it stood, it imposed upon Russia the obligation of fighting on Germany's side if Germany were involved in war with Russia's ally, France. It is true that Russia also pledged herself to make every effort to gain France over to this new alliance, the object of William II. being to organize a continental coalition against Great Britain. When Count Witte, on his return from signing peace with Japan at Portsmouth (U.S.A.), was informed by Count Lamsdorff of the terms of the Treaty, he asked: "Does not his Majesty (Nicholas II.) know that we have a treaty with France?" "Of course his Majesty knows that," Count Lamsdorff replied, "but the fact must have slipped from his mind, or, what is more probable, he was befogged by William's verbiage, and he failed to grasp the substance of the matter" (Count Witte's *Memoirs*, English ed. 1921). Count Witte and Count Lamsdorff were afterward able to obtain the abandonment of the Treaty, while Prince Bülow and the German Foreign Office, conscious of the absurdity of their master's achievement, were content to let the Imperial agreement be treated as *non avenu*. In the Willy-Nicky correspondence, which he conducted in bad English, William had endeavoured to hold Nicholas to the bargain by adjuring him, "God is our testator," (*sic*). The correspondence represents an attempt on the part of William to exercise a kind of tutorship over Nicholas even in Russian home affairs and to instill into his mind suspicions both of France and of Great Britain.

During the years immediately preceding the World War William II. was only gradually recovering from the *contretemps* which overtook him in 1908, when Prince Bülow, then Chancellor, repudiated the utterances published on William's behalf in the *Daily Telegraph* (Oct. 28 1908) and exacted from him by the threat of resignation a public promise that he would in future abstain from such personal incursions into the realm of foreign policy. The Emperor nevertheless continued when he visited foreign courts to impress upon those with whom he came into contact his conviction that he was an autocrat in the conduct of Germany's foreign relations.

At the end of Oct. 1910 he visited the Belgian court, accompanied by the Empress, and addressing the King of the Belgians said: "May our relations of confidence and friendly neighbourliness be drawn ever closer! May welfare and blessing be shed by Your Majesty's reign upon your Royal house and upon your people! That is my desire, which springs from the depths of my heart." At the Hotel de Ville he addressed the Mayor, M. Max, who four years later was to be sent to a German prison by the invaders of his country, and spoke of the "sober and industrious" Belgian people, expressing at the same time "our profound gratitude and our warmest wishes for the prosperity of Brussels and for a happy future." When the Emperor delivered these speeches he knew that Count von Schlieffen's plan for violating Belgian neutrality in the event of war with France lay cut and dried in the pigeon-holes of the German General Staff, and it was a plan which he himself had endorsed. In May 1911 he paid his last visit to England, and was present as the guest of King George V. at the unveiling of the monument to Queen Victoria in front of Buckingham Palace, when the King, whose advisers remained ignorant of certain of the Emperor's wilder intrigues and schemes, referred to "the strong and living ties of friendship between the thrones and persons of the two sovereigns."

In Feb. 1912 Lord Haldane visited Berlin in order to discuss proposals for a concurrent limitation in the increase of British and German naval armaments. As Lord Haldane states in his book *Before the War*, the visit was the sequel of a personal initiative of William II. through the medium of Sir Ernest Cassel. The Emperor had been concerned at the state of tension, dangerous to peace, which had attended the Morocco negotiations with France in the previous year. That critical episode had arisen out of the despatch of the German gunboat *Panther* on July 11 1911 to Agadir, not long after William II.'s return from his visit to England. In the meetings of German ministers with Lord Haldane, at one of which (between Lord Haldane and Adml. von Tirpitz) the Emperor was present in the self-imposed capacity of audience or chorus, he manifestly endeavoured for Lord Haldane's benefit to play for the time being the part of a constitutional monarch, exhibiting the balance of the ministerial advice from one side (Tirpitz) and from the other (Bethmann Hollweg) by which he had to guide his course. Lord Haldane's conclusion was that William II., and with him Germany, suffered from the lack of a constitutional system with a responsible government, the ministers being chosen more or less arbitrarily by the Emperor "and chosen in varying moods as to policy. . . . Thus the Kaiser was constantly being pulled at from different sides, and whichever minister had the most powerful combination at his back generally got the best of the argument. He had constantly to fix one eye on public opinion in Germany, and another on public opinion abroad. It is therefore not surprising that Germany seemed to foreigners a strange and unintelligible country." Lord Haldane's opinion gives one aspect of the situation, but hardly takes sufficient account of the wayward personal initiative of William II., springing either from his own conceptions (as at Björkö) or from casual outside influences which his ministers were unable to control. Incidentally it may be mentioned that except, perhaps, for the Eulenburg episode in 1905–7 there was no so-called Court party, although military influences were frequently at work. As Prince Bülow said, the mischief which was done by sudden personal interventions of the Emperor was manifest, but nothing was known of the mischief which had been prevented.

In home affairs there was a fresh Imperial outburst about Alsace-Lorraine in May 1912, when the Emperor threatened the Burgomaster of Strassburg with the withdrawal of the new constitution of the Reichsland, which had been granted in the previous year. The threat was ill-considered, but Bethmann Hollweg defended it in the Reichstag.

In March 1912 William II. paid a visit to the Emperor Francis Joseph at Schönbrunn, and in April he met King Victor Emanuel at Venice by way of preparing for the renewal of the Triple Alliance, which took place on the following Dec. 5. There was a visit of King Ferdinand of Bulgaria to Berlin in June, and in July the Emperor met the Tsar at Baltic Port. An incident which excited considerable attention was the presence of William II. for the first time at manœuvres of the Swiss army, and the favourable popular reception of the Imperial visitor at Berne, Basle and Zürich (Sept. 3–7 1912). A good number of German-Swiss officers had studied military affairs in Germany, and William II., for obvious reasons, seized every opportunity of encouraging the professional sympathies between the two armies, which bore fruit during the World War in the partiality of the Swiss General Staff.

It is noteworthy that during the critical years of the Balkan wars and negotiations, particularly in 1913, William II. kept more than usually in the background. His government was coöperating at the London Ambassadors' Conference for the localization of the conflict and the restoration of peace. He was, nevertheless, cultivating close personal relations, afterward to bear fruit during the World War, with his brother-in-law, Constantine, who had succeeded his assassinated father on the throne of Greece in March 1913. He sent Constantine flattering telegrams on his military prowess, and was consequently able in Aug. 1913 to induce the King of Greece to remove the last obstacle to the Peace of Bucharest (Aug. 10) by withdrawing the Greek claims, as against the Bulgarian, to the Thracian *Hinterland* of Kavala. King Carol of Rumania, at whose request the intervention had taken place, telegraphed to his kinsman, "thanks to you, the peace will be final."

King George V., with Queen Mary, and likewise the Tsar Nicholas II., were present in Berlin at the marriage on May 24 1913 of William II.'s only daughter, Princess Victoria Louise, with Prince Ernest Augustus of Cumberland, at last acknowledged as Duke of Brunswick, a marriage which was described as marking the reconciliation between the Guelphs of Hanover and the Hohenzollerns after the feud which had lasted since the conquest of Hanover by Prussia and the expulsion of the dynasty in 1866. These festivities were followed on June 16 and 17 by brilliant celebrations of the 25th anniversary of the accession of William II., with copious references by German sovereigns and official personages to the military strength of the German Empire under his sway as the guarantee of European peace.

A curious incident occurred in the same month. The Emperor disclosed the fact that one of his predecessors on the Prussian throne, Frederick William IV., had in a political testament recommended his successor, if opportunity arose, to annul the Prussian Constitution which he had granted, or rather imposed, in 1848. William II. announced that he had magnanimously burned this document.

A visit which excited considerable speculation at a later date, when, during the World War, the future of the Russian borderlands became a question of practical politics, was that which William II. paid on June 12 1914 to the ill-fated heir to the Austro-Hungarian monarchy, Francis Ferdinand, and his wife, the Duchess of Hohenberg, at Konopisht Castle in Bohemia. The Emperor was accompanied by Adml. von Tirpitz. It is most probable that, apart from the sustained and ultimately successful efforts of William II. to win the reluctant personal sympathies of Francis Ferdinand (partly by encouraging his ambition to make his wife—who was not of royal birth—Empress when he should succeed to the throne), the object of the visit was to enlist his host's support for the extension of Austrian and inferentially of German naval power and influence in the Mediterranean. The story that the Emperor broached vast schemes for providing, after a contemplated European war, kingdoms for Francis Ferdinand's two sons by resuscitating the Greater Poland of the Jagiellos and by creating a great South-Slav State stretching to Salonika, seems entirely fanciful. A main feature of these alleged schemes was that the hereditary Austrian dominions should politically come into the confederated German Empire. Such an idea was never entertained by any sovereign or government during the Hohenzollern epoch. It had been, indeed, the so-called "Great German" policy of the German Liberals in 1848, but it was rejected by Bismarck and by the ruling classes of Prussia. Its realization, apart from other considerations, would have entailed a diminution of the influence of the Prussian Throne and Government, and an immense strengthening of German Catholicism. It again became, of course, the cherished aspiration of republican Germany and republican Austria after the World War. But it never was an old-Prussian or a Hohenzollern policy.

The news of the assassination of the Archduke Francis Ferdinand and his wife at Serajevo on June 28 1914 reached William II. on his yacht at Kiel during the regatta. His first exclamation, "Now I must begin all over again, my work of years is undone," showed that he had reckoned upon the Archduke as an instrument of German policy when he should ascend the thrones of the dual monarchy. William II. returned from Kiel to Potsdam for a week, and the laying of the mines which caused the world-explosion began. On July 5 Count Hoyos arrived at Potsdam with a letter from the Emperor Francis Joseph containing a memorandum, written before the Serajevo assassination, describing the situation in the Balkans, the menace of the Pan-Slavist agitation, particularly in Serbia, and the changed attitude of Rumania. It was only by cultivating friendship with Bulgaria and by isolating and diminishing Serbia as a factor in the Balkans that these dangers could be averted. The crime of Serajevo, it was added, had only confirmed this estimate of the situation. William II. gave Count Hoyos a reply in which he said that any contemplated action against Serbia ought to be taken without delay, that Russia would certainly be hostile, but that he had long reckoned upon this eventuality. If it came to war between Austria and Russia, Germany would loyally take her stand by her ally. A conference (not, as erroneously reported, a Crown Council, which would have meant the presence of the whole Prussian Ministry) afterwards took place, and was attended by the Chancellor (Bethmann Hollweg), the War Minister (Gen. von Falkenhayn), the Under-Secretary for Foreign Affairs (Zimmermann) and the Chief of the Emperor's personal Military Cabinet (von Lyncker). And on the following day, July 6, there was a conference with Adml. von Kapelle, Tirpitz's right hand man at the Admiralty (Tirpitz was on leave), and with representatives of the War Ministry and the General Staff. It was resolved to take measures of preparation for the event of war, and orders in this sense were issued. At the same time it was arranged that all appearance of unusual excitement or activity should be avoided, and that the Emperor should, according to programme, proceed upon his annual cruise in northern waters. He left for Kiel on the same day, and joined the fleet during its summer manœuvres off Norway. He was constantly kept informed by telegraph of the progress of events. And now began the famous series of his marginal notes, afterward published under the German Republican Government, upon the despatches he received. He was at first enthusiastic for the most energetic measures against Serbia. He suggested that Austria should reoccupy the Sandjak, so as to sever the union of Serbia and Montenegro and prevent Serbian access to the sea. Then "there will be a row at once," he wrote. He deprecated war councils and conferences at Vienna, "because," as Frederick the Great had said, "the timid party always gets the upper hand." On July 19 he ordered the German battle-fleet not to disperse, so that it could at a moment's notice be recalled to Kiel. His chief anxiety at this stage was for the safety of the Baltic, and he wrote an angry marginal note because "the civilian Chancellor (Bethmann Hollweg) had not yet grasped his meaning." He (William II.) must "concentrate his forces on land and sea."

The text of the Austrian note to Serbia was communicated officially to the German Foreign Office on July 22, but the German ambassador in Vienna, Tschirschky, had had it on the previous day, and had probably telegraphed it direct to the German Emperor. It was presented at Belgrade on July 23.

The Kaiser at first exulted over a firmness of which he had thought Austria incapable, and expressed the belief that all Slav states were hollow. "Just tread firmly on the feet of this rabble!"—he added. On hearing that Count Berchtold, the Austrian Foreign Minister, did not desire to take any territory from Serbia he wrote, "Donkey! Austria must retake the Sandjak. . . . Austria must become preponderant over the smaller states at the expense of Russia, else there will be no peace." On the report of Serbian mobilization he recalled the German fleet from the North Sea to Kiel. "If Russia mobilizes, our fleet must be ready in the Baltic, and so it is going home." The chancellor had suggested on July 26 that the Emperor should calm European anxiety by remaining in Norwegian waters, but he was now thoroughly aroused, and on the following day he returned to Potsdam. There he received the text of the Serbian reply, and at first thought it "a great moral success." No doubt the Serbians were liars and orientals, and Austria, he said in a letter to his chancellor, might do well to claim a "*satisfaction d'honneur*" and to exercise "*une douce violence*" by a temporary occupation of Serbian territory as a guarantee.

Anxiety about the attitude of Great Britain was now beginning to influence the Kaiser's mind, and his rage was sudden and great when his ambassador in London reported that Sir Edward Grey regarded the situation as serious and had suggested mediation. He described this as a piece of English pharisaism, and Sir Edward Grey as a "base deceiver, arch-base and Mephistophelian. Great Britain ought to put pressure upon Russia," etc. On July 29 began the rapid interchange of telegrams between the Kaiser and the Tsar, which was to be continued up to and even immediately after the German declaration of war, and in which the object of the Kaiser's frequently rhetorical appeals was to induce Russia to reverse her measures of mobilization against Austria and to refrain from mobilization toward the German frontier. He hoped to score over Russia, by a policy of menace, a diplomatic victory in the Serbian question similar to, but far greater than, that which he had obtained in 1909, when, as he boasted, he had appeared beside his Austrian ally "in shining armour." On July 29 a "Kronrat" with the whole body of the Kaiser's military and political advisers was held at Potsdam, and from Bethmann Hollweg's interview the same evening with the British ambassador (Sir Edward Goschen) and his bid for British neutrality it seems clear that the decision had fallen in favour of war.

After the proclamation of the state of "danger of war" (*drohende Kriegsgefahr*) on July 31, and the delivery of an ultimatum on the same day at St. Petersburg, and after a public mobilization order on the afternoon of August 1, a previously prepared declaration of war against Russia was delivered by the German ambassador at St. Petersburg on the evening of August 1.

Throughout the final episode of the German attempts to secure British neutrality the Kaiser was in a state of violent rage and disappointment, and he gave vent to his feelings in a memorandum to his chancellor on July 30 which may well be the wildest outburst of political passion that a monarch ever committed to paper. He declared that Great Britain had caught Germany in the trap of her loyalty to her Austrian alliance, that this was the crowning success of the policy of King Edward VII., who "though he is dead, is still stronger than I am"; and, finally, he exhorted the chancellor to inflame the Mahommedan world, for "if we are to bleed to death, England shall at least lose India." William II.'s brief exchange of telegrams with King George V., based, as the Emperor's assumptions were, on a false report by his brother, Prince Henry, and on a mistaken account by the German ambassador in London of a telephonic conversation with Sir Edward Grey, may be mentioned in passing. If King George's Government would assure the neutrality of France, the Kaiser was prepared to "employ elsewhere" his troops then moving against her. After Sir Edward Goschen had asked for his passports, a Berlin mob broke the windows of the British embassy. The Kaiser sent an aide-de-camp to the ambassador with an unkingly message, truculently delivered, expressing his regret, but telling Sir E. Goschen that he would "gather from these occurrences an idea of the feelings of the German people respecting the action of Great Britain in joining with other nations against her old allies of Waterloo."

On August 4, William II. opened the session of the last Reichstag of his reign by a war speech, to which he added a personal appeal to the deputies (the Social Democrats alone were absent) to support him "through thick and thin," and individually to shake hands with him in token of their promise to do this. To one of the deputies he said, "Now we will give them (his enemies) a good thrashing."

If during the World War William II. ever attempted to interfere in military dispositions, it is clear that the leaders of the army were successful in preventing his effective intervention. He paid the inevitable visits to the fighting lines at critical moments, especially when a German success was believed to be impending, but there is no reason to believe that he was ever, in accordance with the traditions of his house, under fire. He once or twice narrowly escaped aeroplane attacks, but this was accidental. He lived in his comfortable Imperial train or in a portable asbestos hut, or at Supreme Headquarters at Pless Castle in Silesia, and afterward at Spa. He took no practical military part in the war. His crude rhetoric was from time to time employed in firing the ardour of his troops, as when he exhorted them in Oct. 1914 to destroy French's "contemptible little army," or when in the last year of the war he celebrated the 30th anniversary (June 15 1918) of his accession by describing the struggle as a mortal combat between Anglo-Saxon and Prusso-German ideals. In the eyes of his people his personal prestige did not increase; it distinctly diminished, even before the last phase of open aversion from him. He formally retained the final decision in military as in political affairs. There was a long and bitter struggle between three successive chancellors (Michaelis may be left out of account) and the higher military command on a variety of questions—hypothetical terms of peace, the Brest Litovsk negotiations, the armistice question, and, throughout the war, the best method of maintaining the war-spirit of the population. More than once Hindenburg and Ludendorff threatened to resign, and it was between them and Bethmann Hollweg that William II. had to choose when he parted (July 14 1917) with his first war chancellor. "The Government," as Ludendorff says, "had itself to blame, as it frequently appealed to its agreement with the chief military command, and dismissed proposals and demands on the ground that the military leaders objected."

In naval matters the Kaiser had greater success in resisting the authoritative methods of Grand Adml. von Tirpitz, and carrying out his own policy and Bethmann Hollweg's of holding the High Seas Fleet in reserve, or (as he called it in his order of Aug. 6 1914) "on the defensive." For a long time Bethmann, and perhaps also William II., seem to have hoped that Great Britain might be detached from the Allies, if the struggle for naval ascendency were not too keenly pressed. This hope was chimerical, but Bethmann was not a far-seeing statesman, and the views of the Kaiser, who reckoned upon an intact fleet as a valuable political asset for peace negotiations, were seldom based on sound calculations. Tirpitz found himself compelled to resign on March 16 1916.

William II.'s reputation in peace-time had been largely based upon the spectacular setting which he gave to his policy and upon his rhetorical speeches. All effects of that kind gradually failed him during the World War, and some of them lent themselves to ridicule. In Jan. 1916 he had a meeting with his Balkan ally, King Ferdinand of Bulgaria, at Nisch, when Ferdinand at a banquet addressed him in obsequious terms and exclaimed in unconsciously ambiguous Latin, "*Tu es Caesar et gloriosus!*" The Emperor's part in the attempts to secure a "German Peace" in 1916 and 1917 was singularly unfortunate. The declaration issued on Dec. 12 1916 by Germany and the powers associated with her was manifestly a manœuvre to anticipate President Wilson's peace action, to represent the Allies as blood-thirsty and unconciliatory, and to hearten the German working-classes for the fight. It gave no information as to terms, and it contained no reference to the crucial question of the future of Belgium. What the Kaiser's ideas of peace terms at that date may have been is a matter of inference from what has since become known regarding his attitude some six months later. After the Reichstag's so-called "Peace Resolution" of July 1917, efforts were made to induce the Vatican to interest itself in the question of peace, and ultimately a papal note on the subject was issued. In a document addressed on behalf of William II. to Mgr. Pacelli, the Papal Nuncio at Munich, the Kaiser's peace terms were described as including an indemnity of 30 milliard dollars from the United States and 40 milliard dollars from France. Longwy and Briey, rich mineral districts on the French frontier, were to go to Germany, and Great Britain was to give up Malta. The disclosure of these items in the Imperial document was made in the Reichstag on April 27 1921, by the Independent Socialist, Dr. Breitscheid, Chairman of the Reichstag Committee for investigating responsibility for the origin and prolongation of the World War. In 1917 as in 1916, the only peace which William II. and his military and political backers contemplated was a peace with victory (*Siegfrieden*).

The events which led up to the collapse of Germany and flight of William II. in Nov. 1918 were political as well as military. Even so stout a Catholic conservative as the Chancellor, Count Hertling, had described the Prussian franchise question, for example, as "a matter of life and death for the dynasty." Internal reforms were long overdue, and this one had been promised in the Kaiser's edicts of April and July 1917, though only as a result of the apprehensions excited by the revolution in Russia. The obstinacy of the Prussian reactionary Chamber of Deputies and the Upper House delayed the reform until the monarchy fell. In the Reichstag the Imperial prerogatives—especially the right in certain circumstances to make war and peace—were being dealt with by a committee on the Constitution. Prince Max of Baden's Coalition Government, which included several Social Democrats, was avowedly installed for the purpose of introducing Parliamentary Government as well as for making peace. Here again reform came too late.

On Aug. 14 1918, the alarm which Ludendorff had communicated to the Kaiser regarding events in the field and the *moral* of the German troops had induced William II. and his political advisers to contemplate applying to Queen Wilhelmina of Holland for mediation, but nothing was done for some weeks. In the middle of Sept. the Kaiser addressed to the workmen at Krupp's an appealing speech which showed that he recognized the military situation and the internal conditions of Germany to be almost desperate. He returned at the beginning of Oct. from headquarters at Spa to Berlin.

Meanwhile an urgent appeal by Hindenburg and Ludendorff to the German Government to open negotiations at once for an armistice had revealed the desperate state of affairs at the front to the members of the Government, including the Social Democrats. Shortly after the Emperor's return, the constitutional changes limiting his prerogatives had been adopted by the Reichstag, and the bill was awaiting his signature. On Oct. 28 he accepted the constitutional law in a letter to Prince Max, in which he avowed sentiments with regard to the rights and duties of the representatives of the people which might have saved his dynasty if he had expressed them years or perhaps even some months earlier. The question of his abdication had now definitely arisen and was being ventilated toward the end of Oct. in the Socialist and the Democratic press. President Wilson's frank declaration that he could not trust the word of the existing rulers of Germany gave a great impetus to the discussion. William II. on the throne, whatever might be his revised sentiments, was regarded in Germany as an obstacle to peace. The Independent Socialists had gone further than the other parties of the Left and, through the mouth of their leader, Haase, had declared in the Reichstag that it was no longer a question of the Kaiser alone, but of the Prussian and other German dynasties. The Majority Socialists, who at that stage would have been satisfied with the abdication of William II. and the renunciation of the Crown Prince's rights to the succession, were forced by the attitude of the Socialist left wing to make at least the Kaiser question most urgent. Scheidemann, in his book *Der Zusammenbruch* (1920), gives an account of the reception of the members of the Imperial Government by the Emperor on Oct. 20 1918 at Bellevue Castle in Berlin. It was the first time (with the exception of a parliamentary soirée at the residence of Dr. Helfferich in July 1917, at the time of the so-called Peace Resolution) that William II. had met the new Social Democratic Secretaries of State, men whom he had formerly described in public speeches as "fellows without a country." Scheidemann says that the Emperor, in uniform, advanced holding in his hand a piece of cardboard, on both sides of which on typewritten sheets the words he was to address to his new ministers were pasted. William II. wore a forced smile and moved the cardboard sheet to and fro as if he meant to say "You know how these things are made up." He read the address with a loud voice, and "it would have made an excellent impression," Scheidemann says, "if it had been delivered some years earlier." It expressed the intention that nowhere in the world should there be freer institutions than in Germany. It concluded, however, with a reference to "the last breath and the last blow"—a phrase which was singularly out of place in view of the desperate efforts to obtain an armistice. The Kaiser afterward affably conversed with the Socialists who were presented to him. After he had departed, it was decided by the Ministry that the speech should not be published, as the situation was so far advanced that it would have made a ridiculous impression.

William II. knew what was in the air, and on Oct. 30 he quietly left Berlin for the western front. The revolution now broke out in the navy at Kiel and on Nov. 7 at Munich. Everything had been prepared by the Independent Socialists for the Berlin outbreak which came on the 9th, although another date had originally been contemplated. The Governmental Socialists, unable to control the movement, felt themselves constrained to address an ultimatum on the abdication question to the Chancellor, Prince Max. Emissaries from the Government had been at Spa from Nov. 3 urging the Emperor to abdicate, but he was stubborn and considered that it was his duty to remain and save Germany from Bolshevism. "Moreover," he said, "I should willingly work with the new order and the new Government; various gentlemen in it whom I have met are very sympathetic to me." On the morning of Nov. 9 Hindenburg was early at the Villa Fraineuse, the Emperor's quarters at Spa. The field-marshal had had a thorough discussion of the situation with representatives of the different army commanders, and at one o'clock he sent a final report to the Villa Fraineuse stating that, in the fairly unanimous opinion of the generals, the troops could still be relied upon to fight against the enemy, but would never fight against their own comrades, *i.e.* in defence of the Kaiser and the Prussian dynasty. Meanwhile, abdication was constantly being urged by telephone from Berlin. About two o'clock a precise answer was sent to Berlin that the Kaiser abdicated as German Emperor but not as King of Prussia. The reply came by telephone: "Too late: we have already published his abdication." To the Crown Prince, who had arrived for luncheon, the Emperor said as he departed about three: "Tell the soldiers that it is not true that I have abdicated as King of Prussia." Later, Hindenburg arrived at the Villa with Gen. Groener and Adml. Scheer. It was then "put in the Kaiser's mouth" to abdicate as King of Prussia also. When he left the conference he said to Count Dohna-Schlodien, his aide-de-camp, "You have no longer any Supreme War Lord."

All the afternoon and evening his suite urged him, in view of the feeling among the troops, to escape to Holland. He at first refused, but consented to go and dine in the Imperial train. On the way he said: "I am so awfully ashamed. I cannot find it in my heart to do this. I cannot go away. If there be but one faithful battalion here, I shall remain at Spa." He thus was contemplating a fratricidal war in defence of his crown. In the train one alarming message after another arrived regarding disorder on the lines of communication and concerning the approach of retreating troops to Spa. To those around him the Kaiser said: "At other times I have always known what to do, now I am at a loss." At 10 P.M. Adml. von Hintze urged him to start, for "in an hour it might be too late." The Kaiser finally said: "To facilitate peace for the nation I shall go to Holland. If I went to Germany, it would be supposed that I wanted to rally a new party to help me to make a *coup d'état*." He now considered himself relieved from any duties toward the army, as it had left him in the lurch; nor did he recognize any duty toward the Government which, on its own responsibility, had announced his abdication.

At 5 o'clock next morning,[1] Nov. 10, the Emperor left his train and, with a small suite, fled in motor-cars across the Dutch frontier to Eysden, where he arrived about 8 A.M. According to one account (Lady Norah Bentinck's *The ex-Kaiser in Exile*), he had walked up to a Dutch soldier at the frontier, saying, "I am the German Emperor," and had offered his sword; but no one knew what to do. At 10 A.M. his railway train arrived at Eysden, and he took refuge in it and there spent that day and the following night. Arrangements had meanwhile been made, apparently through the Dutch authorities, with Count Godard Bentinck, who with some reluctance consented to receive him as a guest "for a few days" in his castle at Amerongen. The Imperial train left Eysden at 9 A.M. and at 3 P.M. reached Maarn where Count Bentinck and Count Lynden, governor of the province of Utrecht, were awaiting the ex-Kaiser on the platform. There was a considerable suite in the train, who remained to unpack large quantities of food and wine which they had brought with them. Count Bentinck arrived at Amerongen in his motor-car with the Emperor as evening was falling, and, as the guest entered the house, his first words were "now give me a cup of real good English tea." On Nov. 28 William II. signed his formal abdication at Amerongen, renouncing his rights to the Crown of Prussia and his consequential rights to the German Imperial Crown. On the same day the Empress Augusta Victoria arrived from Wilhelmshöhe Castle to join her husband. His personal suite, which had been a burden to his host, was soon reduced to two officials, a master of ceremonies and an aide-de-camp, but he retained a number of his servants. He seldom ventured, save for motor-car drives, beyond the precincts of the castle, which is surrounded by a moat. He spent most of his time in sawing logs of wood, an occupation in which he was so diligent that he provided the castle with firewood for the whole winter. As souvenirs, instead of autographs, he used to give away small blocks of wood on which he had inscribed his monogram. In June 1920 the ex-Kaiser and the ex-Kaiserin left Amerongen for Doorn, a property which the ex-Kaiser had just purchased, and which is situated near the main road between Utrecht and Arnheim. The house and grounds were henceforth watched by Dutch soldiers. Up to March 1920 the Allies' demand for his extradition was an open question, and notes were exchanged on the subject with the Dutch Government, which officially regarded him as a German refugee but undertook to prevent any political activities on his part. He was believed to have ample means, although it was reported toward the close of 1921 that he had been compelled further to reduce his establishment. In the autumn he managed to send a rhetorical message to a royalist demonstration in Berlin at which Ludendorff was present.

---

[1] According to some accounts he departed during the night.

The prevailing German verdict upon William II. after the war was that he had been entirely unequal, by temperament, by capacity and by education, to the task of guiding the destinies of the German nation. His training before his accession had been almost entirely in the school of Prussian militarism, and, notwithstanding his subsequent travels and his intercourse with statesmen and men of affairs in his own and other countries, he retained in many matters the narrow outlook and the modes of expression of the average Prussian officer. In his cosmogony sovereigns and dynasties occupied a place entirely apart, and he regarded himself and a certain number of other sovereigns as occupying their positions by the grace of God, and as endowed with something like infallibility in home affairs. In his public speeches he affected the rhetoric of the Prussian officers' mess-room banquets and seemed quite unable to measure the effect of his words upon international relations. He aspired to guide the art, the intellect, the industry and commerce and even the theology of his country. He never realized that the age had moved beyond him in spheres in which he was essentially a dilettante. He had a lax conception of truth and honour in his personal diplomacy, and was accustomed to shift his standpoint in foreign affairs according to the nationality of the person with whom he was conversing. Dr. Hammann,[1] however, testifies that there were almost inexplicable lacunae in the Kaiser's memory. One of the German verdicts upon him, which does not appear to be far from the truth, was that his intellect and character had never matured.

The Empress AUGUSTA VICTORIA (*see* 28.669), who was at the castle of Wilhelmshöhe (the place of Napoleon III.'s internment in 1870–71) at the time of the Emperor's flight, joined him at Amerongen on Nov. 28 1918. She was already suffering from a heart complaint, and anxiety with regard to her husband and the possibility of his extradition weighed upon her more than upon him. She died at Doorn Castle on April 11 1921. Her remains were conveyed to Potsdam and placed in a temporary mausoleum in the park of the New Palace. The funeral furnished an occasion for some royalist demonstrations in Berlin. The Empress, although she accompanied William II. on many of his political journeys, confined her interests mainly to her family duties and to works of charity. She had been active in promoting Christian enterprises, particularly the building of churches in Berlin. She was regarded as the model of a German housewife and of a *Landesmutter*, as the Germans used to call the consorts of their sovereigns.

Interesting sidelights on the ex-Kaiser's character, reign and education may be found in such books as Bismarck's *Reflections and Reminiscences* (English ed. 2 vols., 1898). The third vol. of these *Gedanken und Erinnerungen* appeared in Germany in 1921, though it is dated 1919, having long been held up by an interdict given in favour of the ex-Kaiser on the ground that the volume contained the text of confidential letters written by him. In 1921 he withdrew the interdict, as most of the obnoxious material had found its way into the newspapers. See also Prince Hohenlohe's *Memoirs* (1906). Recently published books bearing on the subject are Dr. Otto Hammann's *Der Neue Kurs* (1918), *Um den Kaiser* (1919), which contains perhaps the best character sketch of William II., and *Der Missverstandene Bismarck* (1921), also Baron von Eckhardstein's *Lebenserinnerungen*, 3 vols. (1919–21). For the last phase Scheidemann's *Der Zusammenbruch* (1921) and *Die Deutsche Revolution* by Ferdinand Runkel (1919) are useful, and there is a remarkable, if rather highly coloured, short character sketch by Walter Rathenau, *Der Kaiser* (1919). Lady Norah Bentinck wrote a book of some interest, *The ex-Kaiser in Exile* (1921). (G. S.)

WILLIAM, German Crown Prince up to 1918 (1882–), eldest child of William II. of Germany, was born at the Marble Palace, Potsdam, on May 6 1882. He was educated at the Military Cadets School at Ploen in Holstein and at the university of Bonn. After visits to the courts of Vienna and St. Petersburg and an unofficial visit to Scotland he went on a tour with his brother Prince Eitel Friedrich to Constantinople and to the Nile. On his return to Germany he began his military career by serving in the 1st Foot Guards, and accompanied the Kaiser to England (Jan. 19–Feb. 5 1901) on the occasion of the funeral of Queen Victoria. On June 6 1903 he married the Duchess Cecilia, sister of the Grand Duke of Mecklenburg-Schwerin. There were five children, four sons and one daughter, of the marriage. His political and personal interventions in public affairs gave some trouble in the years preceding the war. He was credited with pan-German sympathies, and on one occasion (Nov. 9 1911) he appeared in the royal box in the Reichstag during the debate on the Morocco settlement and demonstratively applauded speakers who were attacking Great Britain and the Imperial Chancellor, Bethmann Hollweg. He was afterward compelled by the Emperor to make amends to the Chancellor. Other ill-advised interventions were in connexion with the Brunswick settlement, in regard to which he questioned (1914) the adequacy of his brother-in-law Prince Ernest Augustus of Cumberland's renunciation of all claim to the throne of Hanover, and again, on the occasion of the conflict in Dec. 1913 at Zabern in Alsace between officers of the garrison and the civilian population, when he despatched telegrams encouraging the officers in their truculent attitude. He had, nevertheless, done a public service in 1907 by calling the attention of the Emperor to the disreputable morals of the court *camerilla*, headed by Prince Philip Eulenburg, which was being denounced in the *Zukunft* by Maximilian Harden. In 1910–1 he paid a visit to Ceylon, India and Egypt, and he published some account of his experiences in his *Jagdtagebuch*. On the outbreak of the World War he was promoted to the rank of Lt.-General and appointed to the command of the V. Army in the west, where his troops were successful in the battles of Longwy and Longuyon on Aug. 22 and 24 1914. In Sept. 1915 he received the command of an army group, and he was nominally in charge of the German operations against Verdun. After the Armistice he represented himself in newspaper interviews as having been sceptical, since the battle of the Marne, regarding the possibility of the ultimate success of the German arms. His flight to Holland speedily followed that of the Emperor in Nov. 1918, and he went to Wieringen, an island in the Zuider Zee. He formally renounced on Dec. 1 1918 his rights of succession to the crowns of Prussia and the German Empire. The ex-Crown Princess and her children continued to reside at Potsdam, where she enjoyed considerable popularity among all classes of the population.

---

[1] *Um den Kaiser* (1921).

WILLY, the pen-name adopted by the French novelist HENRI GAUTHIER-VILLARS (1859–), born at Villiers-sur-Orge Aug. 10 1859. He was educated at the Lycée Condorcet and the Collège Stanislas, and afterward adopted a literary career. His early works include a *Recueil des Sonnets* (1878), and various volumes of essays and criticism, including *Essais sur Mark Twain et les Parnassiens* (1882), but he is best known for his novels, many of which were written in collaboration with the actress and authoress Colette Willy. The most famous of these is *Claudine à l'École* (1900), with its sequels *Claudine à Paris* (1901), *Claudine en Ménage* (1902) and *Claudine s'en va* (1903). Willy contributed largely to leading reviews, and also published various plays, including a theatrical version of *Claudine à Paris,* produced in 1902.

WILSON, SIR ARTHUR KNYVET, 3RD BART. (1842–1921), English admiral, was born at Swaffham, Norfolk, March 4 1842, the son of Rear-Adml. George Knyvet Wilson. He entered the navy in 1855, and served in the naval operations of the Crimean War and the Chinese campaign of 1857–8. In 1876 he was appointed to the "Vernon," the torpedo school-ship at Portsmouth. Having reached the rank of captain in 1880, he took part in 1881 in the operations against Alexandria and in 1884 won the Victoria Cross for bravery at El Teb. He became rear-admiral in 1895, was appointed Third Sea Lord and Controller of the Navy in 1897, and in 1901 became Vice-Admiral, receiving the K.C.B. in 1902. From 1901 to 1903 he commanded the Channel Squadron, and from 1903 to 1907 was Commander-in-chief of the Home and Channel Fleets. In 1907 he was promoted by Order in Council to the rank of Admiral of the Fleet, and in 1909 was appointed First Sea Lord in succession to Lord Fisher. He retired in 1912, and received the Order of Merit. He died at Swaffham May 25 1921.

Wilson was from the early 'nineties till practically the end of his life the most universally respected figure in the British navy. Himself the most unassuming man, careless of honours (he refused a peerage) and indeed of his personal appearance, he was a scientific sailor of the highest type, and a recognized master of strategy and tactics, whose advice, in and out of office, carried the greatest weight. He had no party, no favourites, and did not advertise. He was a silent man, whom everyone trusted; and during the World War he was still a power behind the Admiralty, and the ungrudging servant of his country.

WILSON, SIR CHARLES RIVERS (1831–1916), English public official, son of Melvil Wilson, was born in 1831, and educated at Eton and Balliol College, Oxford. He entered the Treasury in 1856, was private secretary to the Chancellor of the Exchequer (Robert Lowe) 1868–73, and was Royal Commissioner for the Paris Exhibition of 1878, having been already appointed Comptroller General of Office for Reduction of National Debt in 1874. Whilst holding this position, he visited Egypt in 1876 and early in 1878 was selected as vice-president of the Commission to enquire into the Egyptian financial situation. Some months later he was nominated Financial Minister in Egypt and, in 1879, he and the Prime Minister, Nubar Pasha, were the victims of a serious outrage by the mob in the streets of Cairo—an incident which was the direct precursor of the Arabi revolt and the British occupation of Egypt in 1882. In April 1880, on the fall of the Khedive Ismail and the inauguration of his son Tewfik as Khedive, Rivers Wilson was appointed president of the Commission for the Liquidation of the Egyptian Debt, with full powers to regulate the financial position of Egypt. On the conclusion of this duty he returned to his post in London, and in March 1885 he became joint British Representative on the Suez Canal Board. On retiring from his post as Comptroller General of the National Debt Office in 1894, he became in 1895 president of the Grand Trunk Railway of Canada. He was created a K.C.M.G. in 1880 and was promoted G.C.M.G. in 1895. He died on Feb. 9 1916.

WILSON, SIR HENRY HUGHES, BART. (1864–), British Field-Marshal, was born in Ireland May 5 1864, and joined the army in 1884. He served in the field in Burma between 1886 and 1888, and was wounded. After some years on the staff at home he went out with the expeditionary force to S. Africa in 1899, and he served there, first with the Natal army, and afterward at headquarters till the end of 1900. The period from 1901 to 1906 he spent at the War Office, and after 1904, in which year he was promoted colonel, he had much to do with working out the organization of the newly created general staff. He then became commandant of the Staff College, a position which he occupied until 1910, when he was appointed Director of Military Operations. In this latter capacity he got into close touch with high French military authorities, and gave special attention to the study of strategical possibilities in the event of war with Germany. He was promoted Major-General in 1913.

On mobilization in Aug. 1914 he was appointed deputy-chief of the general staff to the expeditionary force, and he served in that position for the first five months of the struggle, after which he became principal liaison officer between British and French headquarters in the field. He was given the K.C.B., and at the end of 1915 he took up command of the IV. Army Corps; this he held until the opening of 1917 when he went out as head of a military mission to Russia, returning just before the revolution. He was promoted Lt.-General on his return and was then in charge of the eastern command until Nov., when he was sent to Versailles to act as British Military Representative on the newly established Supreme War Council. In the following Feb. he succeeded Sir W. Robertson as Chief of the Imperial General Staff. The great German offensive of March took place almost immediately after his taking up this high appointment, and he played a prominent part in the steps taken to strengthen Sir D. Haig's forces. The friendly terms on which he stood with the French supreme authorities, no less than with the Home Government, contributed materially to ensure that coöperation between the Allies which so greatly assisted in giving victory to their cause. He had been promoted General soon after taking up the appointment, and on the final distribution of honours for the war he was promoted Field-Marshal, was given a baronetcy, and received a grant of £10,000. In December 1921, however, he resigned his position at the War Office (being succeeded by Lord Cavan); and soon afterwards he ranged himself with the supporters of the Northern Irish Parliament in Ulster of which he was elected a member.

WILSON, JOHN COOK (1849–1915), English philosopher, was born at Nottingham June 6 1849. He was educated at Derby and at Balliol College, Oxford, and in 1874 was elected to a fellowship at Oriel College. After graduating, he studied logic under Hermann Lotze at Göttingen. Returning to Oxford, he became well-known as a lecturer and in 1889 was appointed Wykeham professor of Logic. He died at Oxford Aug. 11 1915. Among his publications were *Aristotelian Studies* (1879, republished 1912); lectures on *Axioms*, on Plato's *Timaeus* (1889) and on the *Traversing of Geometrical Figures* (1905).

WILSON, WOODROW (1856–), twenty-eighth president of the United States, was born in Staunton, Va., Dec. 28 1856. He was baptized with the name of Thomas Woodrow Wilson. The Scotch strain predominated in his ancestry, for his paternal grandfather came from county Down, in Ulster, and his maternal grandfather, Thomas Woodrow, a graduate of Glasgow University, from Scotland. The stern Presbyterianism of his father, a minister of small means but marked capacity as a theologian, early influenced him and left an indelible mark upon his character. His early years were spent in Georgia and South Carolina, where he was deeply affected by the sufferings of the South during the reconstruction period. In 1875 he entered Princeton, graduating four years later. His record for scholarship in college was not remarkable, but he was prominent in debating and literary circles, and became student director of athletic sport.

His most notable achievement was an article written in his senior year, and published in the *International Review*, which analyzed unfavourably the procedure of Congress and formed the basis of his more mature political principles. After studying law in the University of Virginia and following a brief attempt to practice in Atlanta, he decided to pursue his studies in government and history at Johns Hopkins University, where he received the degree of Ph.D. in 1886. His thesis, entitled *Congressional Government* and published in 1885, was a development of the attack upon Congressional methods, and because of its clear and felicitous expression has been reprinted many times. In that year[1] he began his teaching career at Bryn Mawr College, where he was associate professor of History and Political Economy until 1888; after two years as professor of the same at Wesleyan, he entered the Princeton Faculty in 1890 as professor of Jurisprudence and Political Economy. With slight changes in title he served in this capacity until 1902, when he became president of Princeton. As professor he rapidly achieved distinction. His lectures were remarkable for clarity of presentation and brilliancy of phrasing, and the same qualities characterized both his addresses and his published writings. His gift was for generalization rather than plodding scholarship, and after the publication of his thesis his happiest literary efforts were in essay form. They display keen critical capacity, but are not remarkable either for erudition or for striking creative power. As president of Princeton, Mr. Wilson devoted himself to serious reforms of the educational and social habits of the undergraduates. In the hope of elevating the standards of scholarship and of increasing the efficiency of instruction, he inaugurated in 1905 the "preceptorial system," designed through small classes to bring teachers and students into the most intimate relationship. In his endeavours to democratize the social life of the university he met determined opposition. Further difficulties developed from a disagreement with the dean of the Graduate College. Mr. Wilson's policies aroused warm controversy among alumni, faculty, and undergraduates.

While at Princeton, both as professor and as president, Mr. Wilson displayed great interest in political questions of the day, and through his addresses and articles speedily won a national reputation. In Sept. 1910 he was tendered the Democratic nomination for governor of New Jersey. The offer coming at the moment when the prospects for success of his policy at Princeton seemed most discouraging, secured his ready acceptance. Resigning his academic position he entered upon an active electoral campaign which won him the support of progressive elements throughout the state, despite the fact that his candidacy had been inaugurated largely under the auspices of the conservative Col. George Harvey (afterwards U.S. ambassador to Great Britain) and the Democratic state boss, Senator James Smith. In Nov. he was elected by a plurality of 49,000 votes. He at once made it plain that he intended, regardless of the protests of machine leaders, to fulfil his liberal pledges and would assume the leadership of the party for this purpose. As governor he successfully carried through a series of reform measures. Of these the most significant were: a Direct Primaries Law, which, supplemented by an effective Corrupt Practices Act, did much to purify the political atmosphere of New Jersey; an Employers' Liability Act; the creation of a Public Utilities Commission; reform in municipal administration, making possible the adoption of the commission form of government. Elections to the state Senate and Assembly in 1911 gave the Republicans a majority in both Houses and the legislative output was curtailed. Nevertheless his final activities as governor were characterized by the impetus which he gave to the passage of a series of bills, known as the Seven Sisters, directed to the protection of the public from exploitation by trusts.

When in June 1912 the Democratic National Convention met at Baltimore to choose a candidate for President, Mr. Wilson's reputation as an effective reformer had brought his name prominently before the delegates. The convention was apparently controlled by conservative elements and there seemed little chance of the nomination of an anti-machine progressive. But as the struggle to secure the necessary two-thirds vote proceeded, with the conservative forces divided between Champ Clark, Harmon, and Underwood, Mr. W. J. Bryan, leader of the progressive elements threw his dominating influence in favour of Mr. Wilson. It proved decisive, and on the 46th ballot he was nominated, July 2 1912. In the campaign that followed he voiced popular discontent with the conservatism of the Republican administration, which he believed to have been too closely allied with the interests of "privileged big business." His campaign speeches, characterized by a striking phraseology, won much applause, but were remarkable for their high moral tone rather than for originality of thought or policy. Like Roosevelt he demanded a national renaissance of ideals. In matters of immediate concern, such as the tariff, trust regulation, currency, the interests of labour, he insisted that the "rule of justice and right" must be set up. As regarded the future, in matters of conservation and trade, he asserted that great opportunities had been lost through the interlacing of privilege and private advantage with the framework of existing laws: "we must effect a great readjustment and get the forces of the whole people once more into play." His radicalism was of a mild sort and he insisted that "we need no revolution, we need no excited change; we need only a new point of view and a new method and spirit of counsel." The popular temper was responsive to such a tone, but success in large measure could hardly have come to him except for the division of Republican forces through the campaign of Theodore Roosevelt as Progressive candidate. In the Nov. election Mr. Wilson received 435 electoral votes as against 88 for Roosevelt and 8 for Taft; but his popular vote was a million less than that of his two chief opponents, and in only 14 states (all in the South) did he receive a clear majority.

Despite the fact that he was the choice of a minority of the whole people, Mr. Wilson's political position when he assumed office on March 4 1913 was one of remarkable strength. He was supported by a Democratic majority in both Houses of Congress, the Republicans were at loggerheads, and he might expect support from the Progressives for much of his reforming legislative programme. His Cabinet was not distinguished, but it contained certain elements of political and administrative strength, which proved advantageous for the moment, although later it was to become the mark for bitter criticism. The President soon made it plain that he was determined, as in his governorship of New Jersey, to exercise his personal influence and his position as head of the party to initiate and carry through the legislation he had advocated in his campaign. His ascendancy in Congress was soon established. After convoking both Houses in special session on April 7 1913, he delivered his first message in person, reviving the custom that had lapsed since the administration (1797) of the elder Adams. He intervened constantly during this and later sessions, to further the legislation in which he was especially interested.

The first important piece of legislation that resulted from the special session was the Underwood Tariff Act, which was passed in Sept. and signed by the President Oct. 3 1913. It provided for a notable downward revision and naturally met strong opposition from varied industrial interests. Such opposition was overcome largely through the personal efforts of Mr. Wilson, who appealed constantly to public sentiment, notably in an attack upon the activities of hostile lobbyists. The Tariff Act, in addition to lower duties and important administrative changes, introduced an income tax—long advocated by Democrats—which was destined in later developments to counterbalance the loss of revenue resulting from the lowering of the tariff; it weighed heavily upon the industrial interests of the North and increased the growing unpopularity of the President in that region. The Tariff Act was followed by a broad measure of currency reform, the Federal Reserve Act, signed Dec. 23 1913; it is generally regarded as the administration's second great legislative triumph. Mr. Wilson's purpose was to supplant the dictatorship of private banking institutions by a reorganization that should provide funds available to meet extraordinary demands and a currency that would expand and contract automatically. Early in 1914 the President called upon Congress to continue its labours of reform by the regulation of the trusts. After long debate and warm opposition, his appeal was answered by the passing of the Federal Trade Commission Act and the Clayton Anti-trust Act. The latter, besides perfecting anti-trust legislation in several ways, met the demands of labour by declaring that labour was not a commodity, by prohibiting injunctions in labour disputes unless necessary to prevent irreparable injury, and by proclaiming that strikes and boycotts were not violations of Federal law. It further exempted labour associations from the anti-trust laws.

---

[1] In 1885 he married Ellen Louise Axson of Savannah, Ga., who died in 1914, leaving three daughters. On Dec. 18 1915, he married Edith Bolling Galt of Washington, D.C.

Mr. Wilson's policy of domestic social reform had thus been developed with surprising legislative success during the first year of his administration. His foreign policy was not so clear-cut and aroused little enthusiasm. It was characterized by an evident desire to concede the rights of other nations to the limit and to avoid any stressing of the power of the United States for the material advantage of its citizens. Definite steps were taken to prepare the Filipinos for self-government. Pressure was brought to bear upon the California state Government to mitigate the severity of its anti-Japanese legislation. The "dollar diplomacy" of the preceding administration was repudiated and American bankers effectively discouraged from participating in the international Chinese loans. As a result of the President's personal demand, Congress repealed the law exempting American coastwise shipping from Panama Canal tolls. Mr. Wilson, however, failed to secure the Senate's ratification of a treaty with Colombia, which contained a virtual apology on the part of the United States and an offer to pay $25,000,000 as reparation for the alleged grievances of Colombia in connexion with the establishment of Panama as an independent country. In the Caribbean, Mr. Wilson's policy differed in principle rather than practice from that of his predecessors; in Nicaragua and Haiti the customs were taken over by U.S. officials. By a treaty signed Sept. 16 1915, a virtual protectorate of Haiti was assumed; in Santo Domingo the precautionary visits of American cruisers were followed in the summer of 1916 by the landing of marines, and in Nov. of that year by the proclamation of a military government under American auspices.

Mr. Wilson's Mexican policy aroused heated criticism. Following the accession of Gen. Huerta to power and the President's failure to arrange a settlement providing for his elimination as dictator, Mr. Wilson resigned himself to what he called a policy of "watchful waiting." Conditions in Mexico were anarchical, and intervention was strongly urged by both American and European commercial interests. To formal intervention the President was definitely opposed, but in April 1914 he was compelled to authorize the occupation of Vera Cruz in retaliation for affronts to American blue-jackets. The proffered mediation of Argentina, Brazil and Chile he gladly accepted, but the resulting protocol of Niagara Falls (June 24 1914) did not provide a basis for peace. Although Huerta fled from Mexico in July, the country continued to be torn by rival factions. American troops were withdrawn from Vera Cruz in Nov. 1914, but it was not until Oct. 1915 that the Government of Carranza was recognized by Mr. Wilson, in company with eight South and Central American Governments. Further complications ensued. The raid into American territory of Gen. Villa, March 9 1916, led Mr. Wilson to authorize a punitive expedition, which soon aroused the protests of Carranza. In May and June the President mobilized the National Guard and sent a force of about 100,000 to patrol the Mexican border. The crisis was tided over by a joint Mexican-American commission sitting at New London, Conn., which brought no definite settlement, but at least postponed hasty action on either side. In Jan. 1917, the last American troops were withdrawn from Mexican soil. The President's policy had not led to stable conditions in Mexico, and the sole advantage secured seemed to be the emphasis laid by the U.S. Government on the principle that it would not take advantage of the misfortunes of a weak neighbour for its own selfish profit.

Foreign affairs after July 1914 were naturally dominated by the World War. President Wilson insisted upon a policy of strict neutrality. This he emphasized not merely by formal proclamation on Aug. 4, but by an address to the American people of Aug. 18, in which he adjured them, in view of the mixture of nationalities in the United States, to be impartial in thought as well as action. His offer of mediation, made on Aug. 5, remained without response, and further attempts at mediation in early autumn proved fruitless. His determination to remain absolutely aloof from European quarrels was underlined in several addresses, in which he insisted that the United States was in no way concerned, and was further emphasized by his opposition to any change in its military policy. America's vital interest in the struggle, however, soon became plain and resulted in diplomatic controversies with the belligerents. Great Britain's attempt to control indirect importation of goods into Germany, by an enlargement of contraband schedules and an extension of the doctrine of "continuous voyage" to conditional contraband, was vigorously opposed by President Wilson, who authorized Mr. Bryan, his Secretary of State, to protest in strong terms. A lengthy interchange of notes followed, which led to no settlement (*see* INTERNATIONAL LAW). The diplomatic controversy with Germany proved more serious. The proclamation of a "war zone" about the British Isles, in which German submarines threatened to destroy enemy merchant vessels with consequent danger to the lives and property of neutrals, was met by a note of Feb. 10 1915, which warned Germany that she would be held to "strict accountability" for the lawless acts of submarine commanders. Mr. Wilson further attempted to find a compromise, based upon a relaxation of the British food blockade and an abandonment of the German submarine campaign. The effort failed and was followed by a series of submarine attacks, which culminated in the sinking of the "Lusitania," May 7 1915, with the loss of over 100 American lives. The President, while he disappointed opinion in the eastern states by a speech in which he reaffirmed his pacific determination, stating that a man might be "too proud to fight," at once set out to win from Germany a disavowal and a promise that merchant ships should not be torpedoed without warning and the saving of the lives of passengers. A lengthy exchange of notes ensued; the pacific Mr. Bryan, Secretary of State, regarding the President's language as too strong, resigned; on the other hand Mr. Wilson's patience with the evasions of the German Government and the continued sinkings by submarines led to bitter attacks upon the President's policy of conciliation, which was stigmatized as anæmic or even cowardly. Mr. Wilson succeeded, however, in securing from Germany a promise not to sink liners without warning (Sept. 1 1915), and continued his efforts to induce Germany to abandon the submarine campaign completely. He was hampered by an attempted revolt of Congressional leaders, who blurred the issue with Germany by introducing resolutions designed to prevent Americans from travelling upon belligerent ships. The President, through his personal influence, secured the defeat of these resolutions in Feb. 1916, insisting that he would not consent "to any abridgment of the rights of American citizens in any respect." Shortly afterwards the issue with Germany was brought to a head by the sinking of the "Sussex," March 24 1916. Mr. Wilson waited three weeks before sending a formal note of protest to Germany (April 19 1916) but couched it in the form of an ultimatum, stating that unless Germany should immediately declare and effect an abandonment of its present methods of submarine warfare, the United States would be compelled to sever diplomatic relations. The German answer, while attempting to make acceptance conditional upon Great Britain's relaxation of the blockade, was in effect a promise not to sink merchant ships without warning and without saving human lives. The submarine issue now seemed less critical.

The diplomatic victory thus apparently secured by Mr. Wilson was utilized in his behalf during the electoral campaign of 1916, in which he was inevitably the Democratic candidate. It enabled his supporters to declare that he had vindicated the rights of the United States successfully, and at the same time had "kept us out of war." The slogan made a strong appeal, especially in the districts of the Middle West. The Republicans, on the other hand, who had nominated Charles E. Hughes, criticized the whole foreign policy of the President. They insisted that he had failed to take prompt action for the protection of American lives and honour, alike in his dealings with Germany and in his handling of the Mexican crisis. They characterized his domestic policy as demagogic, instancing the Clayton Act and the Adamson Act; the latter had been urged on Congress by Mr. Wilson to avert a railroad strike in Sept. 1916, and many citizens regarded it as an untimely surrender to labour threats. They also criticized his attitude on "preparedness," to which the President had been opposed until the close of 1915, and ridiculed the cautious expansion of military and naval forces provided for in the National Defense Act of 1916. In the east and in most industrial centres of the middle west, Mr. Wilson was unpopular, but the election showed his strength in the farming districts west of the Mississippi and on the Pacific coast; in spite of Mr. Roosevelt's return to the Republican fold the President drew largely from the Progressives, and on election day received a slight electoral majority over Mr. Hughes (277 to 254) and a popular plurality of 9,129,606 to 8,538,221.

His re-election enabled Mr. Wilson to proceed with plans for peace proposals to the European belligerents. These he had been preparing since the early summer of 1916, and, regardless of the German peace balloon of Dec. 12 1916, he sent on Dec. 18 identical notes to the belligerents, asking them to state the terms upon which they would consider peace. Informed of the undercurrents of German military circles, he evidently feared that if the war continued, the United States would necessarily become involved; he also hoped that a clear definition of war aims would strengthen pacific elements in both belligerent camps. The German reply was evasive; that of the Allies refused to consider peace until Germany should offer "complete restitution, full reparation, and effectual guarantees." The replies gave the President opportunity to expound what he had come to believe was the only sure basis of an enduring peace. This he did in a speech of Jan. 22 1917, in which he insisted that the peace must be organized by the major force of mankind, thus emphasizing the need of a League of Nations; that no nation should extend its policy over another nation; that no one Power should dominate the land or the sea. There must be a limitation of armaments. As a guarantee of future peace and justice, the ending of the existing war must not be the violation of the rights of one side or the other: it must be "a peace without victory." Further efforts to secure a peaceful arrangement were frustrated by the determination of the German militarist clique to renew the submarine warfare, regardless of the effect on the United States. On Jan. 31, the German ambassador, von Bernstorff, delivered a note to this effect, and four days later the President handed him his papers. He still, however, avoided formal war with Germany, and on Feb. 26 asked for a resolution of armed neutrality, which would permit the arming of American merchant ships for entrance into the barred sea zone. The resolution was blocked by a filibuster. Finally, in view of continued sinking of American ships, the President came to Congress on April 2 1917, and asked for a declaration that a state of warfare existed with Germany. The resolution was passed by the Senate on April 4, by the House on April 6.

President Wilson had always abhorred the exercise of force in international relations, and the war which he at last regarded as necessary was, in his mind, a war to ensure peace. Nevertheless he was determined that it should be waged efficiently and that the mistakes of previous wars should not be repeated. Those mistakes, he believed, had resulted chiefly from the intermixture of politics in military affairs, and from the decentralization of the American military machine. He opposed a coalition war cabinet, as leading to divided responsibility. Military policy was handed over to the military experts. He approved the immediate development of the general staff as the centralizing military organ, and it was upon the recommendation of that body that he urged, against the wish of Congressional leaders, the Selective Service Act. On the advice of the general staff he appointed Gen. John J. Pershing commander of the expeditionary force to France, and, also following that advice, he refused to authorize a volunteer force under Mr. Roosevelt. Similarly the plans for the development of a large army in France were inaugurated and translated into fact by the military experts. As regards conduct of operations the President gave to Gen. Pershing complete authority, and permitted no interference by politicians. In the building of the new army, the President took no direct part, but he used his authority consistently to favour centralization under the general staff. He followed a similar policy in the mobilization of the industrial resources of the nation. He encouraged the centralizing efforts of the Council of National Defense and its committees, and sought always to secure for them executive rather than the merely advisory powers which they at first possessed. He urged the Lever Act, which in Aug. 1917 created a Food and a Fuel Administration, and advocated the taking over of the railroads by the Government in Dec. His policy of economic centralization was ultimately assisted by the many protests against his war policies which were made in the winter, and which centred round the demand for a non-partizan war cabinet or ministry of munitions; for his supporters were able to insist that the more effective handling of war problems demanded not new machinery but greater efficiency of the existing mechanism. The President asked for powers to cut through red tape and rearrange bureaus without reference to Congress. His demands were embodied in the Overman Act, which was passed in May 1918, and which enabled him to grant executive powers to the various boards that had been created. The War Industries Board, released from its dependence upon the Council of National Defense, at once became the centralizing organ of the economic activities of the country. In his war appointments Mr. Wilson disregarded party lines, a notable fact since in political appointments he always showed himself strictly a party man. Republicans such as Hoover, Stettinius, Goethals, Schwab, Vanderlip, were chosen because of their administrative qualities and regardless of political affiliations.

During the war President Wilson consistently developed his ideals of a new international system which should perpetuate peace and assure justice and security to every nation regardless of its material strength. He hoped thus not merely to construct a basis for just peace when the war should end, but to hasten the end of the war by appealing to the peoples of the enemy states against their Governments. The most notable of his speeches was that of Jan. 8 1918, in which he stated 14 points necessary to a just and lasting peace. This, with his later addresses, was ultimately accepted as the basis of the final settlement. Their effect in Germany and Austria-Hungary was not apparent until the military defeat of those empires, but his words acted continually as a corroding factor, weakening the enemy's determination to fight. When in the autumn of 1918 they faced military defeat, they turned to Mr. Wilson offering to accept his Fourteen Points as the basis of peace. The President's insistence upon justice as an essential to a lasting settlement had brought him great prestige in Allied countries, but the chiefs of the Allied Governments hesitated to accept the Fourteen Points in the fear that the material advantages of the victory might be thrown away. They yielded, however, to the persuasive diplomacy of Col. House, who represented the President at Paris, and it was on the understanding that the Fourteen Points (reservation made of "Freedom of the Seas" and inclusion of Germany's promise to make full reparation) should be the basis of the peace that the Armistice was granted to Germany.[1] The President realized, however, that it would be difficult to translate his principles into the actual treaty. Aside from the opposition he might expect from selfish nationalistic interests among the

---

[1] The Fourteen Points are set forth in full in the article WORLD WAR, under the subhead *Political History*.

Allies, he lacked unified support at home, where his political opponents called for a " strong peace " that would annihilate Germany; there was little enthusiasm for a League of Nations, which the President regarded as essential to a just and lasting settlement. Furthermore he had weakened his political position at home by a series of tactical mistakes. Of these, the most important was an appeal issued immediately before the Congressional election of Nov., in which Mr. Wilson asked the voters to cast their ballots for Democratic candidates, on the ground that a Republican Congress would divide the leadership at the moment of international crisis. Such an appeal would have been comprehensible if it had been made by a prime minister in a parliamentary country, but Wilson had proclaimed himself the leader of the nation and could not logically also play the rôle of party leader. The Republicans seemed to have some ground for complaining that although they had submerged partizan quarrels during the war, President Wilson was now attempting to capitalize the war and foreign affairs in order to win a partizan advantage. Many voters were antagonized by the appeal, and the elections went in favour of the Republicans. The President thus lost command of the Senate in the next Congress and its Foreign Relations Committee was to be controlled by his political and other opponents. Believing that his presence at the Peace Conference was necessary, if it was not to be dominated by old-style diplomatic practices, Mr. Wilson decided himself to go to Paris, and on Dec. 4 1918 sailed with the other members of the American Commission on the " George Washington." He arrived at Brest on Dec. 13, and was received at Paris, in England, and at Rome with tremendous enthusiasm. For the moment he was the popular hero, both in Allied and enemy countries. But his prestige rested on a precarious footing, and must inevitably diminish when he came to oppose the national aspirations of any people. He was anxious, therefore, to strike off a quick general peace, leaving details for later settlement; but this proved impossible, and formal conversations at Paris began only in Jan. 1919. The President succeeded in winning an early victory when he persuaded the conference to accept the principle of the League of Nations as the basis of the peace, and when, on Feb. 14, he won unanimous approval of the preliminary draft of the covenant. On returning to the United States, however, he found Republican opposition to the league strongly manifested in the Senate, although he had the support of Mr. Taft's influence in that party and in the country. Public opinion seemed to be uninstructed and apathetic as to the President's policies. Going back to Paris in March, he was able to secure the insertion in the covenant of certain amendments required by American sentiment, and the approval by the conference of the final draft of the covenant. But he was confronted by the demands of the French, Italians and Japanese for territorial and economic concessions from the enemy, which he regarded as excessive. Long discussions followed, culminating in Mr. Wilson's acceptance of a portion of the Allied demands, notably the granting of Shantung to the Japanese, of much of the frontier line promised by the Treaty of London to Italy, and the exaction from Germany of what amounted to a blank cheque in the matter of reparations. Such concessions aroused the opposition of liberals in England and America, who insisted that the President had surrendered his principles. Mr. Wilson, on the other hand, acknowledging that certain aspects of the settlement were not ideal, believed that he had won his main contention in securing the League of Nations, which provided the mechanism for eradicating the vices contained in the treaties. In this belief he was supported by another liberal protagonist, Gen. Smuts. On June 29 1919, the day following the signing of the Versailles Treaty, the President sailed for America. His international prestige had suffered from his opposition to national claims, especially that of the Italians to Fiume and of the French to the left bank of the Rhine. Nevertheless, as the bitterness of the moment passed, the magnitude of his accomplishments at Paris became more generally recognized. When the veil of secrecy surrounding the negotiations was gradually lifted, it was seen that the belief that he had been outmanœuvred by Lloyd George and Clemenceau was hardly justified by the facts. Lacking the negotiating ability of Lloyd George and the political experience of Clemenceau, he refused to enter the diplomatic lists with them, but by his manifest candour and sincerity early disarmed his opponents in argument. He said exactly what was in his mind, and was careful that his statements should be fortified by the documents and statistics furnished by his expert advisers.

The strain of the conference had told upon Mr. Wilson's physical and nervous strength. He was thus not well equipped to wage the struggle with his Republican opponents in the Senate which developed upon his presentation of the treaty. Had the President been willing to compromise and accept reservations to the covenant of the league, it is possible that the two-thirds necessary to ratification might have been secured. This course he refused to follow, and it soon became clear that the Foreign Relations Committee would not recommend ratification without serious reservations or amendments. In the hope of winning popular support, the President set forth upon a tour of the country and along the Pacific coast aroused enthusiasm in marked contrast to the coldness of the east. The effort, however, overtaxed his strength, and on Sept. 26 at Wichita, Kan., the President was compelled to give over his tour and return to Washington, where he suffered a complete nervous collapse. The exact nature of his illness was not made public and few realized how serious it would prove to be. Many, however, felt that in view of his inevitable abstention from active work, it would have been wiser for him to retire at least temporarily. As it was, his system had provided for no understudy and the administration was left without a leader. Entirely apart from the confusion thus caused in the conduct of the public business, Mr. Wilson's illness led directly to the defeat of the treaty. There was no one else capable either of leading the fight for ratification without reservations, or with sufficient authority to arrange a compromise. On Nov. 14 the Senate adopted reservations which Mr. Wilson declared would " nullify " (etc., etc.) the treaty; for this reason he urged the Democrats to refuse to vote for the ratifying resolution, which was accordingly defeated on Nov. 19 1919. During the succeeding weeks efforts were made to arrange a compromise. The Republican leaders agreed to soften the language of certain reservations, and the President intimated that he would accept a mild reservation on Article X. of the covenant, which had aroused the chief opposition. Neither side would yield enough, and when on March 19 1920, the final vote was taken on the ratifying resolution, which contained a strong reservation on Article X., Mr. Wilson again urged Democratic senators not to accept. The resolution thus failed of the necessary two-thirds by a margin of seven votes, 57–37. The President appealed to the autumn presidential election in 1920 as the decisive plebiscite. Although he had lost his former control of the party, and the Democratic presidential nominee at San Francisco was not his choice, the Wilsonian policies, including approval of the League of Nations, were inevitably the issue of the elections. In the electioneering campaign, however, the President himself could take no active part, for his physical collapse proved so serious as to confine him to the White House. For the overwhelming victory won by the Republicans, *see* UNITED STATES (*History*). After his defeat Mr. Wilson kept close silence on public matters, and his annual message of Dec. 1920, while it sounded the note of national duty, made no reference to that which lay nearest his heart—the League of Nations. This silence, indeed, he preserved until the close of his administration, March 4 1921. In Dec. 1920 he had been awarded the Nobel Peace prize.

The failure of President Wilson to win the approval of the United States for his peace policies presents one of the most interesting problems of American history. He had led the country through the difficult period of a war unsurpassed in magnitude and culminating in complete victory; in the face of serious obstacles he had forced European statesmen to accept the major item in his programme; he returned home only to be repudiated by his own people. Personal and partizan factors unquestionably contributed to his defeat. In private intercourse Mr. Wilson displayed a personal magnetism, a breadth of culture, and a genial cordiality that are amply attested by his intimates. But in public life he proved unable to capitalize such advantages, possibly because of natural shyness, possibly because physical delicacy restricted his social activities. Roosevelt's capacity for "mixing" with all political and human types he totally lacked. In the formation of his policies he isolated himself and was unable to establish close relations with Congressional leaders. This gave rise to the impression that the President disliked advice, was an ego-centric autocrat, and immediately dispensed with anyone who disagreed with him. Such criticism, by no means a novelty in the case of strong-willed presidents, was utilized by his political opponents and intensified his unpopularity in the industrial centres, especially of the east, an unpopularity which, except for a few months during the opening months of the war, was an outstanding factor in the political situation. Broadly speaking, the criticism does not seem to be fully justified. In matters of what he regarded as principle he was adamant, and he distrusted the judgment of those whose basic point of view was different from his own; but the evidence of those who worked with him, including that of Republican advisers at Paris, is almost unanimous to the effect that he was anxious to secure advice, was tolerant of opinions, and glad to delegate responsibility. The contrary belief was doubtless fostered by Mr. Wilson's inability to build up an efficient secretarial organization, and his incapacity, rather than unwillingness, to apportion effectively the details of administrative labour. His handling of war problems shows clearly his desire to delegate responsibility; once an appointment was made he refused to interfere and consistently protected his appointee from the importunities of politicians.

Political responsibility in general, he believed, should rest with the President. From conviction, rather than from egotism, he sought to emancipate the presidential office from the control of Congressional committees, a control which he earnestly deplored in his earliest writings. The President, he felt, should be the real leader of the nation, and not a mere executive superintendent. The Cabinet he looked on as an executive and not as a political council, and it was always strictly subordinated to his policies. So long as the Democrats held the majority in Congress he was able to translate such ideas into fact, and effectively disposed of all attempted Congressional revolts. This attitude naturally did not allay the political resentments which were inevitably aroused and which were intensified by Mr. Wilson's tendency to regard political opposition as tantamount to personal hostility; when the Democratic majority disappeared he faced uncompromising hostility. He was intensely impatient of partizan obstruction of his idealistic plans, and there is much of the Calvinist in his refusal to temporize or deviate from the path which he believed himself appointed to tread. While in matters of detail he showed at times some capacity for compromise, in matters of principle he displayed the unswerving determination characteristic of the prophet, a trait that is not always conducive to success in the exigencies of modern party warfare. Indeed it is as a prophet, rather than as a statesman that Mr. Wilson should be regarded. No one has preached more effectively the necessity of introducing a moral standard into international politics.

The following are the most important writings of President Wilson: *Congressional Government, a Study in American Politics* (1885); *The State—Elements of Historical and Practical Politics* (1889); *Division and Reunion, 1829–1889* (1893); *An Old Master and Other Political Essays* (1893); *Mere Literature and Other Essays* (1893); *George Washington* (1896); *A History of the American People* (1902); *Constitutional Government in the United States* (1908); *The New Freedom* (1913); *On Being Human* (1916); *International Ideals* (1919). Personal and political biographies of President Wilson have been written by H. J. Ford, *Woodrow Wilson: The Man and His Work* (1916); by H. W. Harris, *President Wilson: His Problems and His Policy* (1917); by W. E. Dodd, *Woodrow Wilson and His Work* (1920); and by his private secretary, Joseph P. Tumulty, *Woodrow Wilson as I Know Him* (1921). All four are eulogistic, especially the last two named. General surveys of Wilson's foreign policy are to be found in E. E. Robinson and V. J. West's *The Foreign Policy of President Wilson, 1913–1917* (1917); and in Charles Seymour's *Woodrow Wilson and the World War* (1921). Editions of President Wilson's State papers have been made by Albert Shaw, *President Wilson's State Papers and Addresses* (1917); by J. B. Scott, *President Wilson's Foreign Policy;* and *Messages, Addresses, Papers.* (C. SEY.)

WIMBORNE, IVOR BERTIE GUEST, 1ST BARON (1835–1914), British politician, was born at Dowlais Aug. 29 1835, the eldest son of Sir Josiah John Guest, 1st bart., of the firm of Guest, Keen & Nettlefold (the Dowlais Iron Works). He was educated at Harrow and Trinity College, Cambridge, and afterwards devoted himself to the management of his large property. He succeeded his father as 2nd bart. in 1852. He stood for Parliament as a Conservative several times between 1874 and 1880, and in the latter year was raised to the peerage. During the Tariff Reform controversy he seceded from the Conservative party, and afterwards sat in the House of Lords as a Liberal. He died at Canford Manor, Dorset, Feb. 22 1914. Lord Wimborne married in 1868 Lady Cornelia Spencer Churchill, eldest daughter of the 7th Duke of Marlborough.

Lord Wimborne's eldest son, IVOR CHURCHILL GUEST, was born Jan. 16 1873, and was educated at Eton and Trinity College, Cambridge. He unsuccessfully contested Plymouth in the Liberal interest in 1898 and served in S. Africa with the Dorsetshire yeomanry in 1900. In 1900 he was elected for Plymouth, holding the seat until 1906, and from 1906 to 1910 sat for Cardiff. In 1910 he was raised to the peerage as Baron Ashby St. Ledgers and sworn of the privy council, while from 1910 to 1912 he was paymaster-general. He became Lord-in-waiting to King George V. in 1913, and in 1914 succeeded his father as 2nd Baron Wimborne. In 1915 he became lord lieutenant of Ireland, but resigned in May 1916, after the Irish rebellion. He was, however, reappointed in Aug. 1916, and remained in Ireland till May 1918, when he was on his retirement created a viscount. He was well known as an enthusiastic sportsman and polo player, and to him was due the organization of the polo team which defeated the U.S.A. in the international match at Meadowbrook, Long Island, in June 1914.

WINCHESTER, England (*see* 28.704).—The pop. increased from 23,378 in 1911 to 23,791 in 1921. In 1912 the necessary work for preserving the cathedral by underpinning the walls and laying new foundations (undertaken in 1905) was completed, and on July 15 of that year the King and Queen attended a great Thanksgiving Service at the cathedral. The total cost of restoration was £113,000, raised by voluntary subscriptions. As much of the work had to be carried out under water varying in depth from 6 to 20 ft., a diver was employed continuously for 5½ years to lay down cement concrete at the base of the new foundations. The work was carried out by Sir Thomas Jackson and Sir Francis Fox. During 1919–21 a large part of the ancient stained glass in the cathedral was also restored.

In 1918 a find of iron currency bars of the early iron age was made on Worthy Down, near Winchester, and, in excavations near the same spot in 1920, some "pit dwellings" were located, the area appearing to be the site of a settlement of that age. The objects found were placed in the city museum. A number of other objects of archæological interest have been unearthed, including a portion of a stone column with its capital and dedication stone to Carinus (A.D. 283–4), the only inscription to that Emperor as yet found in Great Britain. In 1919 the valuable Dale collection of prehistoric and Roman antiquities was purchased and placed in the museum, and the Rosehill collection of prehistoric remains was transferred to the Tudor House museum at Southampton. A map of ancient Winchester, indicating all existing ancient and historic buildings and the sites of those no longer in existence, was issued by the Ordnance Survey in 1920.

A site of 100 ac. in the St. Cross district of the city has been planned on self-contained garden city lines, on which 560 houses were in course of erection in 1921. New county council offices for the county of Hampshire, on Castle Hill, were opened in 1911. The Guildhall was extended in 1914, and the old Tudor Guildhall restored in 1915. A chamber of commerce was established in 1919. During the World War Winchester was a prominent military centre, and some 50,000 troops, including Canadians and Americans, were continually in training there.

WINGATE, SIR FRANCIS REGINALD (1861–), British general and administrator in the Sudan (*see* 28.729). In Dec. 1916 he was appointed High Commissioner for Egypt and relinquished the governorship of the Anglo-Egyptian Sudan, after a successful administration during 16 years. At the beginning of 1919 Sir Reginald Wingate was summoned to London to report on the situation which had arisen in Egypt, and he remained there many months at the disposal of the Government until his resignation in Oct. 1919. He had received the G.B.E. in Jan. 1918, and was created a baronet in June 1920.

WINNIPEG (*see* 28.731), the capital of the Canadian province of Manitoba, had a pop. at the close of 1920 estimated at 198,000 (271,958 including suburbs). The Dominion census of 1911 gave a pop. of 136,035. Winnipeg is the great commercial metropolis of western Canada, its importance having been enhanced since 1911 by the completion of the Grand Trunk Pacific Railway (which later became a part of the Canadian National Railways system). The Hudson Bay railway, intended to link Winnipeg with Port Nelson on Hudson Bay and thus to provide an outlet by sea through the summer months for the produce of the west, was still under construction in 1921. Begun as a private enterprise, it had been taken over by the Canadian National Railways system: its completion was expected to improve further Winnipeg's position as the trade outlet of the west. As the wholesale centre for the prairie provinces Winnipeg housed in 1920 5,000 commercial travellers representing an annual wholesale turnover that exceeded $300,000,000. The assessed value of property in the city that year was $259,419,520. After 1911 Winnipeg grew in importance as a manufacturing centre, and in 1920 had 513 factories and industrial plants, including flour mills, packing houses, structural steel works, rolling mills, tanneries, sugar refineries, clothing, harness, soap, jewellery and dye factories, etc. The output of its industries in 1917 amounted to $98,101,632. The almost unlimited power resources of the Winnipeg river, 100 m. away, led to a scheme for an extensive hydro-electric system, to develop 175,000 H.P., which was in course of construction in 1921. The Civic Power Electric Co. had developed 60,000 H.P., and the Winnipeg Electric Railways had developed 30,000 and had 50,000 under construction in 1921. The building of the Grand Trunk Pacific Railway, Canada's third trans-continental railway, in the years following 1911, opened an important phase in Winnipeg's history. The company's extensive railway shops were located at Winnipeg, and the Fort Garry Hotel was erected by the railway in the heart of the city.

WINTER, JOHN STRANGE (MRS. ARTHUR STANNARD) (1856–1911), English writer (*see* 28.734), died in London Dec. 13 1911.

WIRELESS TELEGRAPHY AND TELEPHONY (*see* 26.529).—Wireless telegraphy and telephony (also called radiotelegraphy and radiotelephony) made enormous progress between 1910 and 1921. This was due chiefly to the improvements and advances, effected in three great inventions, viz.: the three-electrode thermionic tube developed out of the Fleming oscillation rectifying valve, the high frequency alternator, and the Poulsen arc generator of continuous waves. The first of these has given a means of detecting electric waves of immense sensitivity, and also a most effective and easily managed generator of continuous electric waves. The second has provided machines for creating high frequency electric currents, and therefore electric waves, of great power, enabling large long-distance radio stations to be equipped which can signal to any part of the world by day or night. The third has also given an alternative method of generating high-power continuous waves. These generating and receiving appliances quite revolutionized wireless telegraphy and made wireless telephony possible not merely as an experimental feat, but as a practically useful art. In addition to these inventions there have been others such as directive radiotelegraphy, and wire-guided high frequency telegraphy and telephony of immense utility. The application of the thermionic valve in ordinary wire telephony as a repeater is also bringing about improvements of very great importance. Contemporaneously with these achievements investigations have been made of a more scientific character arising out of the study of the nature of electric wave propagation round our globe and of the causes of atmospheric disturbances, called "strays," which have always been the great obstacle to practical radiotelegraphy.

We shall consider briefly the nature of these improvements in turn.

High Frequency Alternators.—It had become clear by 1904 or 1905 that the use of continuous waves in radiotelegraphy would have marked advantages over the then employed damped wave trains produced by condenser discharges, and would be essential for the accomplishment of radiotelephony. The most obvious method of producing such continuous waves (C.W.) was by some form of high frequency alternator. At that time, when wave lengths of 300 to 3,000 metres or 1,000 to 10,000 ft. were mostly in use, this meant the design of machines giving alternating currents having a frequency of 1,000,000 to 100,000,000, and such frequencies seemed unattainable by any ordinary alternator construction as long as the revolving part of the alternator had to carry coils of wire. In low frequency alternating current dynamos, generating currents, reversed 50 to 200 times a second, there is an electromagnet which provides a constant magnetic field through which field coils of wire are moved so as to generate in the latter an alternating current. Either the field coils or the armature coils may be the rotating portion. In the case of alternators required to produce high frequency currents (20,000 to 100,000) it is impossible to rotate coil-wound armatures or fields at the necessary speed, and the most usual solution of the problem is to construct inductor alternators in which the moving part consists merely of a disk or drum of steel with teeth or ridges on its edge or surface, which serve to change the magnetic flux through stationary armature coils, the field coil also being fixed. We can then balance such a drum or disk and so fashion its edge that it can be rotated at a high speed safely. With the increase in capacity and wave length of the aerial wires or antennæ requisite for long distance power stations, frequencies between 20,000 and 100,000 came into use, and attention was again directed to the design of alternators giving such frequencies.

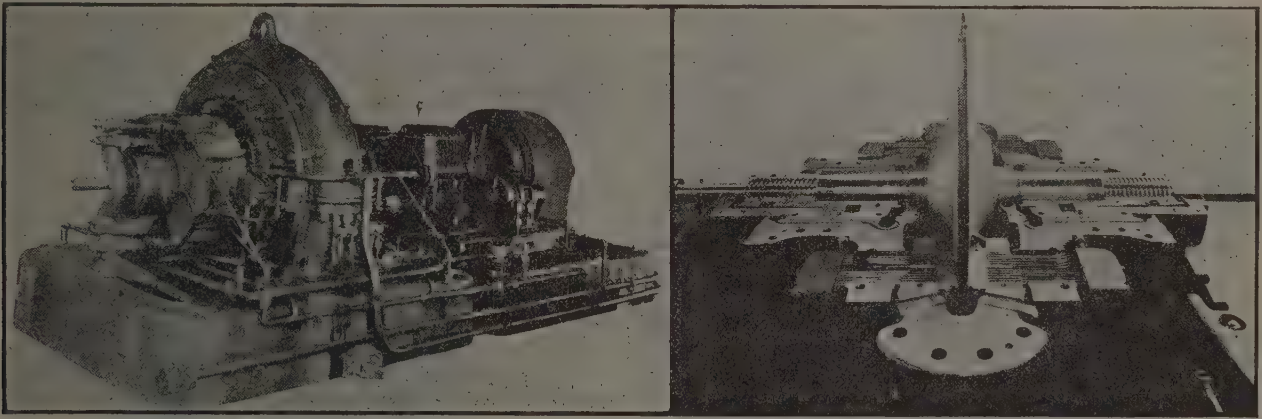
M. Latour has classified these machines into: (1) alternators in cascade, (2) internal cascade alternators, (3) homopolar or inductor alternators, (4) variable reluctance alternators, and (5) alternators with partial utilization of periphery. Although Béthenod in France constructed in 1912 a small machine of type (1), the first alternators of type (2) of 100 kilowatt output, or so, were constructed by R. Goldschmidt about 1912.

In machines of types (1) and (2) we start with the production of a single-phase alternating current of some moderate frequency, say 10,000, and multiply it up to much higher frequencies by taking advantage of a well-known principle called Fresnel's theorem. If there be two equal vectors represented by lines of equal length, which are pivoted to one point and revolve with equal angular velocities in opposite directions, their resultant is a line of constant direction but periodically varying magnitude with amplitude twice the size of that of the revolving vectors. Hence an alternating magnetic field of constant direction may be resolved into two fields of constant magnitude but rotating in opposite directions, each of half the maximum amplitude of the alternating field. If then we pass a direct electric current through the field coils of an alternator and induce in the revolving armature an alternating current say of 10,000 frequency the field due to this armature current may be resolved into two oppositely rotating fields, one of which is stationary as regards the field magnets and the other cuts them with twice the angular velocity of the rotor. This gives rise to a current of twice the frequency in the field coils. The field due to this latter current can again be resolved into two oppositely rotating fields and these induce currents of still higher frequency in the rotor coils. We can so build up currents of frequencies in the ratio of 1, 2, 4, etc. The currents of intermediate frequency can be taken up in circuits comprising capacity and inductance tuned to these frequencies respectively. The current of the highest frequency can be put into an aerial wire and employed to radiate long electric waves of corresponding wave length.

High frequency alternators of the above description were built for the radio station established at Tuckerton, N.J., in correspondence with a similarly equipped one at Eilvese, near Hanover in Germany, and used for trans-Atlantic transmission from about 1912 up to the time of the entrance of the Unite States into the World War.

The third type of high frequency (H.F.) alternator, called the homopolar inductor alternator, is represented by the machines of E.F.W. Alexanderson with disk rotor, and Béthenod-Latour and the Société Française Radio-Electrique with drum rotor.

The principle of these alternators is as follows: a fixed ring-shaped frame or stator has inwardly projecting teeth of laminated iron, and a ringshaped magnetizing coil traversed by a direct exciting current causes magnetic flux to spring across from the teeth on one side (N. poles) to the teeth on the other side (S. poles). This flux traverses the air gap. Over these teeth is a zig-zag armature winding. Between the teeth in the Alexanderson machine revolves a steel disk with teeth cut in the periphery (*see* fig. 1 and fig. 1a).



FIGS. 1 (left hand) and 1a (right hand).—FIG. 1, 200 kilowatt Alexanderson high frequency alternator, driven by an electric motor. FIG. 1a.—Half section of the Alexanderson high frequency alternator; showing the inductor disk which revolves between the stator poles. (By permission of *The Wireless Press.*)

The number of teeth in the rotor is half the number of teeth on each side of the stator. These rotor teeth as they pass between the stator teeth decrease the reluctivity of the air gap and increase the magnetic flux passing. Hence as the rotor revolves the magnetic flux linked with the armature circuit is alternately increased and decreased. This creates an electromotive force and a high frequency current in the armature circuit. The only revolving part of the machine is thus a well-balanced rigid steel disk. The field exciting coil and the armature coil are both stationary. Such machines are called in English inductor alternators and in French homopolar alternators.

In the Béthenod-Latour machines the inductor is in the form of a steel drum with exterior of laminated iron in which longitudinal grooves are ploughed out. The stator ring has inward radially pointing laminated iron teeth on both edges, and the magnetic flux, leaving one set of teeth (N. poles), passes down through the drum teeth and up again into the other set of stator teeth (S. poles). The ridges on the drum serve to increase and decrease the flux through the armature wire which is wound zig-zag on both sets of stator teeth.

The peculiarity of the French machine is that the rotor or drum has many more ridges or teeth on it than the stator ring. By this we can obtain the necessary high frequency without dangerous peripheral speed in the rotor, and yet leave plenty of space for the armature winding placed on the stator teeth.

On account of the few turns in the armature such machines give a small electromotive force, but this can be raised by suitable static transformers, one secondary terminal of which is connected to the radiating antennæ and the other to the earth plates. The aerial wire is then tuned to the frequency of the alternator and the necessary wave length. A point of importance is the exact regulation of the speed of the machines which must be kept constant to within 0·1% of the normal. This is achieved by the use of very sensitive governors which control the speed of the direct coupled electric motor which drives the alternator. The signals are made in the case of the Alexanderson machines by varying the inductance of a tertiary coil on the transformer which transfers the energy from the aerial to a non-radiative circuit. By placing condensers in series with the H.F. alternators it has been found possible to run them in parallel, that is two or more together just as in the case of low frequency alternators in electric lighting and power stations.

High frequency homopolar alternators of the Béthenod-Latour type have been built by the Société Française Radio-Electrique up to 220 kilowatts size for the French military radio station at La Doua, near Lyons. To avoid loss of power by air churning these machines are enclosed in an air-tight case in which a partial vacuum is maintained. The speed of the machines is controlled by a Thury governor, and signals are made by short circuiting the armature coils in sections. Two or more machines can be run in parallel, thus giving to the aerial 500 or 600 kilowatts of electric power. Also similar machines are employed in the large French radio station at Croix-d'Hins near Bordeaux, and are installed in the very large French radio station at St. Assise, near Melun, which began to be erected in 1921. Alexanderson alternators of 200 kilowatt power are installed at the American naval radio station at New Brunswick, N.J. This station communicates with Stavanger radio station in Norway (3,554 m.) with Lyons (3,845 m.) and Nauen, near Berlin (3,958 m.) (*see* fig. 1).

The Arc Generator.—We must next mention the improvements made in connexion with the Duddell-Poulsen arc generator. In this appliance an electric arc is formed with a direct current between a water-cooled copper electrode (the positive terminal) and a carbon negative electrode. The arc is inclosed in a chamber filled with coal-gas or kerosene or alcohol vapour, and a powerful transverse magnetic field is made across it (*see* fig. 2). If the arc terminals are shunted by a circuit containing a condenser and an inductance coil, high frequency oscillatory currents will be set up in this latter circuit under certain conditions. Their

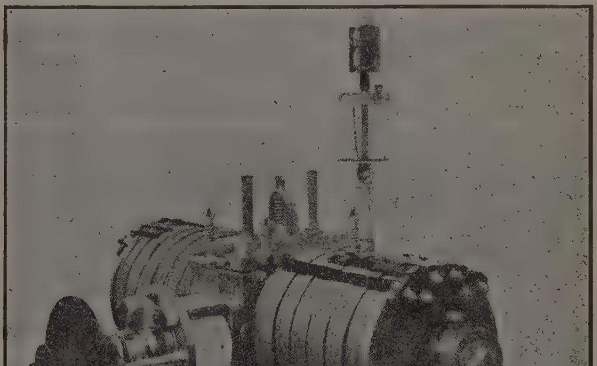


FIG. 2.—25 kilowatt Poulsen arc generator of electric oscillations; showing the electromagnet and arrangement for dropping alcohol into the arc box. (By permission of Marconi's Wireless Telegraph Co., Ltd.)

energy can be inductively transferred to an aerial wire so as to radiate continuous electric waves from it. The arc must be in a certain *active* condition determined by its length and the strength of the magnetic field in order to produce oscillations. Many investigations have been made to elucidate the working of this oscillation-producing arc.

A fairly complete list of these papers is given by P. O. Pedersen in the *Proceedings of the Institute of Radio Engineers* (United States), vol. v, p. 255, Aug. 1917.

In order that the arc may be active, *i.e.* produce oscillations in the condenser circuit, it must be drawn out to a certain length, and the transverse magnetic field must have a certain optimum value, which depends upon the density of the gas in which it is immersed and on the frequency of the oscillations and the strength of the direct current feeding the arc.

Under best conditions the effective or root mean square value of the oscillatory current is $1\sqrt{2}=0{\cdot}7$ of the strength of the direct feeding current. Thus, if the arc is fed with 100 amperes (D.C.), it should give 70 amperes (A.C.) in the oscillation circuit under best conditions: the possibility of this transformation is the result of the negative slope of the characteristic curve of the direct current arc, viz. that an increase in arc current is accompanied by a decrease in electric potential difference and vice versa. Also the necessity for maintaining round the arc a non-oxygenic atmosphere, or one consisting of hydrogen or carbon hydrides or oxides, is due to the fact that in these gases the arc characteristic has a steeper downward slope than in air (see W. L. Upson, *Phil. Mag.* July 1907). The transverse magnetic field is requisite suddenly to extinguish the arc at each oscillation, and so produce an electromotive force in the inductance coil which recharges the condenser in the reverse direction. Broadly speaking then, the operation which takes place is as follows:—if the arc is burning steadily and the condenser is shunted across the electrodes, the result is to rob the arc of some current. Hence the potential difference (P.D.) of the arc electrodes increases. This, however, continues the charging of the condenser in the same direction. Then the latter discharges back through the arc and this lowers the P.D. of the electrodes.

The study of the oscillatory arc by means of the oscillograph by H. Th. Simon, H. Barkhausen, A. Blondel, and P. O. Pedersen has shown clearly the nature of the operations taking place. If no magnetic field, or a weak one is employed, and if the arc is in air only, feeble oscillations are set up in the condenser circuit, and the current through the arc is a pulsatory unidirectional current. This is the case of the Duddell or musical arc which has no use in wireless telegraphy. If a stronger magnetic field is used and if the arc is in a hydrogen or coal gas atmosphere, then much more powerful oscillations are produced, and when the R. M. S. value of the condenser current is equal to, or greater than 70% of the direct current the arc current just falls to zero, or is extinguished at each oscillation. The function of the transverse magnetic field is then to blow out the arc by forcing the stream of electrons outward, and the effect of this sudden rupture is to create a strong adjuvant or assisting induced electromotive force in the inductance coil in the condenser circuit. This continues the arc current in the same direction, and the condenser thus becomes charged in the opposite direction. The process then repeats itself and we have powerful oscillations produced in the condenser circuit.

Although the condenser current is a sinusoidal current, and the arc current has the same form, yet owing to the shape of the dynamic characteristic curve the potential difference of the arc electrodes is an irregular curve with sharp peaks corresponding to the instants of cessation and recommencement of the arc current.

The practical construction of a Poulsen arc generator involves therefore a large electromagnet having poles which project into a box which can be kept full of alcohol, or kerosene vapour or else coal-gas. Into this box project also two electrodes, one of copper, through which water circulates to keep it cool, and one of hard carbon which is kept in slow rotation by a motor. The poles of the magnet are shaped bluntly conical so as to concentrate a powerful magnetic field transversely to the electric arc which springs from the copper (+) to the carbon (−) electrode. The arc is created by a direct current dynamo giving a voltage of 500 or more (*see* fig. 2). A separate shunt-wound dynamo is often employed to excite the electromagnet. In the circuit of the arc supply dynamo choking coils are inserted, and a circuit comprising a condenser of capacity C and an inductance (L) is connected as a shunt to the arc. If the capacity C is measured in farads and the inductance in henrys then the ratio $\sqrt{L}/\sqrt{C}$ is a function of the dimensions of a resistance reckoned in ohms, and should have some value of about 500 ohms or so.

Means must be provided for adjusting the magnetic field to its optimum value (Ho) which depends on the frequency (n) of the oscillations produced, where n is nearly equal to $1/2\pi\sqrt{LC}$, or upon the radiated wave length λ (in metres) where $n\lambda=300$ million metres.

P. O. Pedersen states that $\text{Ho}=a/\lambda-b$ where a and b are certain constants (see "The Poulsen Arc and its theory" *Proc. Institute Radio Engineers*, United States, vol. v, p. 255, Aug. 1917). L. F. Fuller states that $\text{Ho}=\frac{K\sqrt{P}}{\lambda}$ where P is the power furnished to the arc and K is a constant depending on the surrounding gas or vapour. For kerosene $K=4{\cdot}23$; for ethylic alcohol $K=8{\cdot}5$. For a power of 50 kilowatts and a wave length of 7,000 metres the arc in alcohol requires a field of 8,300 C.G.S. units and for a wave length of 20,000 metres and a power of 1,000 kilowatts the field must be 13,500 C.G.S. units. Hence as the air gap is large (generally several centimetres) extremely large magnets are required. For the 1,000 kilowatts arc plant the magnets weigh 80 tons and for the 500 kilowatts plant 65 tons. For smaller sizes of plant the magnet is of the open circuit type and for the larger of the closed circuit type. The arc chamber and magnets have to be cooled by water or oil circulation. From 100 kilowatts size and upwards this arc generator is very widely used in long distance radio stations. It labours, however, under the disadvantage that the signalling cannot be conducted by starting and stopping the arc but only by throwing the aerial out of tune or by deflecting the energy into a non-radioactive circuit. Hence power is equally consumed whether message signals are being sent out or only spacing waves.

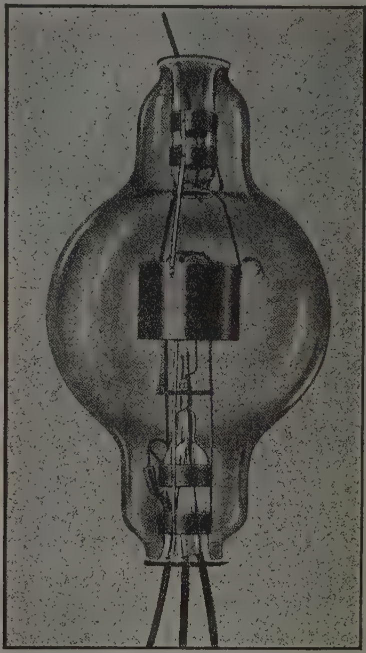

FIG. 3.—Modern thermionic generating valve; showing the cylindrical anode and metal gauze grid, as made by the Marconi-Osram Valve Company. (By permission of Marconi's Wireless Telegraph Co., Ltd.)

The Thermionic Valve.—The third type of high frequency electric oscillation generator which has become of great importance in the last five years is the thermionic valve, which is a development of the Fleming valve (*see* 26.537).

The Fleming valve comprises a glass bulb, highly exhausted of its air, and contains a carbon or metal filament which can be rendered incandescent by an electric current. Around the filament is placed a metal cylinder carried on a wire sealed through the bulb. The peculiar property of it is that, when the filament is incandescent, the space between the filament and cylinder will conduct negative electricity from the filament to the cylinder but not in the opposite direction. Hence the name "valve" given to it. It can, therefore, be used to separate out the two constituents of a high frequency alternating current and "rectify" them into a direct current. This valve was extensively used as a detector of electric waves in wireless telegraphy from 1904 onward as described later. In 1907, Lee de Forest in the United States, after he had become acquainted with Fleming's invention of the valve and its use in wireless telegraphy, added to it an additional element in the form of a grid or zig-zag of wire placed between the cylinder and the filament but carried on a separate terminal. He thus made a so-called three-electrode thermionic valve, a name sometimes shortened into *triode.*

In its modern form a thermionic valve of the latter type comprises a highly exhausted glass bulb having in it a filament of tungsten, or thoriated tungsten or of platinum wire coated with oxides of barium and strontium (*see* fig. 3). This is rendered incandescent by electric current from a storage battery. Around the filament is a spiral of nickel wire or else a cylinder of nickel wire gauze. This is technically called the grid. Around that again is a cylinder of sheet nickel called the plate. The plate and the grid are carried on separate wire stems sealed through the wall of the bulb. Although the three-electrode valve was originally devised as a detector of electric oscillations as described below yet about 1913, or before, it was found that both the two-electrode valve and also the three-electrode valve can produce electric oscillations as well as rectify or detect them. When the filament is rendered incandescent torrents of electrons or particles of negative electricity are emitted from it. If the plate is given a positive potential relatively to the filament by means of a battery called a plate battery, these electrons are attracted to it, and this creates a movement of negative electricity called a thermionic current. If the bulb is highly exhausted and has a grid in it between the filament and plate, the electrons can only reach the latter by passing through the holes in the grid. If the grid is given a negative potential it reduces or stops the thermionic current. If it is given a positive potential it increases the current. The relation between thermionic current and grid potential can therefore be represented by a characteristic curve as shown in fig. 4.

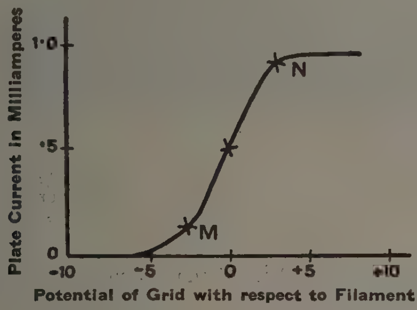

FIG. 4.—Characteristic curve of a three electrode thermionic valve.

The three variables, viz. plate and grid potential (v_p and v_g) and the thermionic current (i_p), may be regarded as three rectangular coördinates which define a characteristic surface, and sections of this, parallel to the $i_p v_g$ axes or $i_p v_p$ axes, delineate the principal characteristic curves. The central portion of this surface, corresponding to zero grid potential, is nearly a plane and has therefore the equation $i_p = av_g + bv_p$ where a and b are certain constants or coefficients.

If we pass a current by means of a high voltage battery from the filament to the plate and send this current also through the primary coil of an oscillation transformer, the secondary circuit of which is connected to the filament and grid, we have an arrangement by which continuous electric oscillations are produced and maintained. For, if properly connected, any variation of the grid potential will increase or decrease the plate current; and this acting through the transformer will in turn create the changes of grid potential which act to sustain the variations of plate current. The action is just like the well-known experiment of the singing telephone. If a magneto-telephone receiver is in series with a carbon transmitter and with a battery, then, when the transmitter is held near the receiver, the latter emits a shrill note. The sound given out by the receiver acts on the transmitter and this in turn actuates the receiver. The energy is drawn in both cases from the battery.

The three-electrode valve so used is called a transmitting valve, and the sustained electric oscillations it can produce, as above described, can be transferred to an aerial wire and cause it to radiate continuous electric waves.

Very large thermionic valves are now made with glass or silica bulbs, a foot or more in diameter, for use as transmitting valves, and numbers of these can be associated together to form a thermionic generator of large power. In this case the high voltage required to pass the plate current through the valve is obtained by the use of a battery of Fleming two-electrode valves which rectify a high tension alternating current of low frequency. A complete valve panel, as it is called, comprises the battery of rectifying valves, and three-electrode valves and also the necessary transformers, induction coils and condensers (*see* fig. 5). Large valve panels are now constructed to transform electric power from 1 kilowatt to 50 kilowatts or more into high frequency electric oscillations of great energy.

Such valve generators are extensively used by Marconi's Wireless Telegraph Co. and others for the production of continuous waves, and are employed at Clifden Station in Ireland for the transmission of wireless messages across the Atlantic Ocean.

Detectors.—We must in the next place notice the improvements which have taken place in means for detecting continuous waves (C.W.) as used in wireless telegraphy. The reader may refer to the earlier article on Wireless Telegraphy (*see* 26.535) for an account of the principal appliances used in connexion with spark or damped wave telegraphy for the detection of electric oscillations, and especially to the section on the oscillation valve or two-electrode thermionic detector, from which other types of improved thermionic detector have been developed. Subsequently to the introduction of the two-electrode, but prior to the advent of the three-electrode thermionic detector, much use was made of *crystal* or *rectifying* detectors.

It will be remembered that the electric waves sent out from the transmitting aerial wire, which are identical in nature with light waves except for their much greater wave length, fall upon an aerial wire at the receiving station, and create in this latter extremely feeble, high frequency electric currents or oscillations which are a copy on a very reduced scale of the electric oscillations established in the transmitting aerial. The strength of these feebly received currents reckoned in amperes (I_r) can be approximately computed from the strength of the currents in the sending aerial (I_s) reckoned in amperes by means of an empirical formula valid up to about 2,000 m. due to L. W. Austin and L. Cohen which is as follows:—

$$I_r = I_s \frac{377\, h_r\, h_s}{\lambda d\, R} \epsilon^{-0{\cdot}0045 d / \sqrt{\lambda}}$$

where h_s and h_r are the heights of the sending and receiving aerial wires in kilometres, d is the distance apart of the stations in kilometres, λ is the wave length in metres, ϵ the base of the Napierian logarithms, and R the total resistance of the receiving circuits in ohms.[1]

The received currents may be something of the order of 5–10 microamperes more or less in the case of long distance working. To detect these feeble oscillations special appliances called detectors are in use. The so-called rectifying detectors do this by converting the received oscillations into feeble unidirectional currents, which in the case of damped waves are equivalent to short gushes of electricity in one direction corresponding in frequency to the condenser discharges in the transmitter. These can then be detected by a telephone, as they create in the latter a musical sound agreeing in pitch with the wave group frequency, and this, by the action of the key in the transmitter, is cut up into *dot* and *dash* audible Morse signals. One of the first rectifying crystal detectors was carborundum discovered in 1906 by H. H. C. Dunwoody in the United States. This material is a crystalline carbide of silicon produced in electric furnaces, and, in certain specimens, as shown by G. W. Pierce, has an electric conductivity 40 or 50 times greater in arc direction than in the opposite along one crystalline axis.

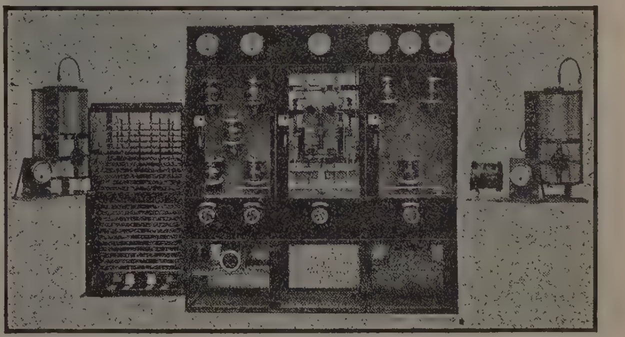

FIG. 5.—Valve panel for generating high frequency oscillations in the transmitters for wireless telegraphy, as made by Marconi's Wireless Telegraph Co., Ltd. (By permission.)

The same properties are exhibited by hessite and anatase as well as by molybdenite and other native sulphides. Furthermore, it was found by L. W. Austin and G. W. Pickard that contacts between certain pairs of substances such as tellurium and aluminium, or zincite and chalcopyrite, also plumbago and galena, have the same kind of unilateral conductivity and can be employed for "rectifying" high frequency oscillations. These crystal and rectifying detectors came at one time into great use in wireless telegraphy.[1]

---

[1] The problem of predetermining the electric and magnetic force at any point on a conducting sphere due to a Hertzian oscillator at some point on it is a very difficult one. The reader will find references to the work of Macdonald, Nicholson, Love, Rybczynski, and others in *The Principles of Electric Wave Telegraphy*, Fleming, 4th ed. chap. ix., and also in a paper by Balth van der Pol in *Phil. Mag.*, vol. xxxviii. (Sept. 1919). The final result is that diffraction alone will not account for long distance radiotelegraphy.

The limitation in the power of these crystal or rectifying detectors lay in the fact that the energy used in making the signal is only a portion of that captured by the receiving aerial from the incident waves. An immense improvement was therefore effected by the introduction of the three-electrode thermionic valve, which can act in the manner of a telegraphic relay and employs the received power merely to release a much larger amount of electric power from a local battery, which latter creates the signal in the telephone or other instrument. Moreover, this type of detector is capable of being used in series so as to amplify or magnify enormously the signal-making power.

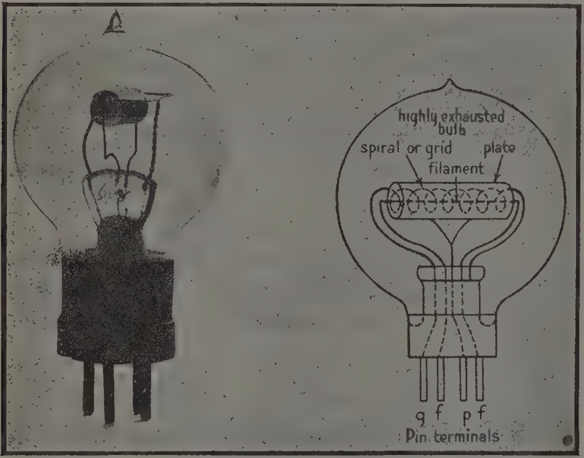

FIG. 6.—Thermionic amplifying and detecting valve of the type usually called the "French" valve with cylinder anode and spiral wire grid surrounding a straight filament.

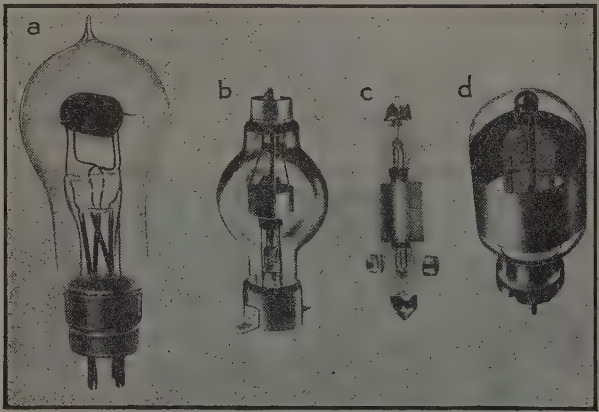

FIG. 7.—Views of various types of three-electrode thermionic valves; (*a*) detecting and amplifying valve; (*b*) transmitting or generating valve; (*c*) amplifying valve of a type made by Marconi's Wireless Telegraph Co.; (*d*) small transmitting valve with gauze grid.

The modern hard or high vacuum thermionic valve as used for reception and amplification is now generally constructed as follows:—a small glass bulb or tube, a few inches in diameter, has sealed into it a filament which can be rendered brightly incandescent by current from a 2-to 3-cell storage battery (4–6 volts). This filament is of drawn tungsten wire, or else platinum coated with oxides of barium and strontium. The bulb is highly exhausted. Around the filament and close to it is coiled a spiral of nickel wire called the grid, and outside that a cylinder of nickel called the plate. The plate and grid are carried on wires sealed through the bulb, and connexions to the grid, plate and filament are brought to four terminal pins at the base fixed to a brass collar (*see* figs. 6 and 7). These pins fit into a suitable socket. A battery of 30 to 200 volts E.M.F. has its negative terminal connected to the filament and positive to the plate, and when the filament is incandescent a stream of electrons (atoms of negative electricity), called the plate current, flows from the filament to the plate through the apertures in the grid wires. This current completes its circuit through a coil of wire in the external plate filament circuit which may be one coil of a transformer. If the grid has a small negative charge given to it the plate current decreases, and, if a positive one, the plate current increases. The relation of plate current to grid potential can be delineated by a characteristic curve (*see* fig. 4). For a certain positive grid potential the plate current becomes saturated and ceases to increase. If the grid and filament are connected to the terminals of the receiving condenser in a wireless telegraph aerial, the incidence of electric waves on the aerial will create alternations of potential in the grid and alternations of plate current, and the amplitude of the plate potential may be five to ten times greater than that of the grid. The thermionic tube is then said to have an amplifying power of five to ten.

If the coil in the plate circuit forms the primary coil of a two-coil transformer the secondary circuit of the latter may be connected to the grid and filament of a second valve, and a second amplification of potential may take place. We can thus employ a series of valves *in cascade* and the total amplification increases as the *n*th power of the number of valves (n) in cascade. Thus if one valve amplifies potential ten times, three valves will amplify 1,000 times and so on.

This use of thermionic valves in cascade has given us detectors of enormous sensitivity. In order to detect damped oscillations we can adopt one of two methods. If we place a small condenser with a leak across its terminals in the grid circuit then the side of this condenser next the grid becomes negatively charged, and the plate circuit of the valve is reduced. This charge leaks away almost instantly and the plate current of the valve rises again. Hence if the incident waves are in "damped trains" a telephone receiver inserted in the plate circuit of the valve will give a sound of the pitch of the train frequency, and this can be cut up into signals. In this case the valve is used as a rectifier as in the case of the Fleming valve. The second mode of use depends upon the form of the characteristic curve. If we employ a small battery of cells to give the grid a certain positive potential we can operate the valve at a point on the curve near to the saturation point so that a small reduction in the potential of the grid lowers the plate current, but a small increment of potential does not increase it. Hence if the grid is connected to one terminal of the tuning condenser of a receiving aerial it will oscillate in potential when a train of electric waves falls on the aerial. This, however, will cause a drop in the plate current and hence a sound in a telephone receiver included in that circuit. If the incident waves are damped or intermittent trains the result is to make a steady musical sound in the telephone of the pitch of the train frequency. Accordingly, by interrupting the groups by the sending key, audible Morse signals can be received.

The above described methods of reception are however only applicable in the case of damped or intermittent trains of waves. If the electric waves are continuous as sent out by an alternator, arc, or valve transmitter, then we can only detect signals made with them by converting the continuous waves into the equivalent of a series of damped trains. This is done by generating in the receiving aerial electric oscillations by a local valve generator which have a frequency differing from that of the incident waves by about 300 to 1,000. The result is to create in the receiving aerial resultant electrical oscillations which fluctuate periodically in amplitude just as "beats" in musical sounds are produced when two organ pipes slightly out of tune are sounded together. The number of beats per second is equal to the difference in the frequency of the two separate oscillations. In the aerial wire these electrical beats can then be detected by any of the types of detector and receiver used in spark wireless telegraphy. This method is therefore called "beat reception." The beats disappear when the signal bringing waves are interrupted at the sending station in making the spaces between the Morse code signals.

One great use of the three-electrode valve, or triode, as it is sometimes called, is in amplifying feeble signals. It has been explained already that when the grid of the valve is electrified positively or negatively it increases or decreases the plate current and, therefore, the plate potential. The amplitude of the plate potential variations may however be five or ten times or more that of the grid potential variations. Hence the valve acts as a relay or magnifier of potential. Again we can interconnect a number of such triodes in series by induction coils so that the variations in plate current of one valve are made to vary the grid potential of the next. Hence by using a series of valves in cascade we can multiply potential variations of the grid of the first valve in a geometric progression and enormously magnify them. The remarkable achievements of modern long distance wireless telegraphy are chiefly due to the use of such cascade amplifiers. In fig. 8 is shown a view of such a detector made by Marconi's Wireless Telegraph Co. in which six valves are used as amplifiers and a seventh valve as a detector. So sensitive are these cascade receivers that it is not necessary to employ any long aerial wire to receive wireless signals from distant stations. It suffices to construct a large rectangle of a few dozen turns of insulated wire called a frame aerial and connect this in series with a condenser of suitable variable capacity and tune the arrangement to the wave length of the wave to be received. This frame is then placed with its plane vertical and in the direction of the sending station. As the incident electric waves sweep over it they set up in the wire very feeble electric oscillations. If a cascade thermionic amplifier is then connected to the terminals of the receiving condenser and appropriate tuning carried out the signals will be heard in the receiving telephone. It is possible to make one small storage battery of three cells provide the electric current for incandescing the filaments, and one battery of 40–50 cells provide the plate currents for all the valves. Very compact and portable multiple valve receivers of this type have been constructed for use in aircraft and for reception of time signals from distant radio stations.

---

[1] A fuller description of these rectifying detectors is given in *The Principles of Electric Wave Telegraphy and Telephony* by J. A. Fleming, 4th ed. chapter vi. (1919).

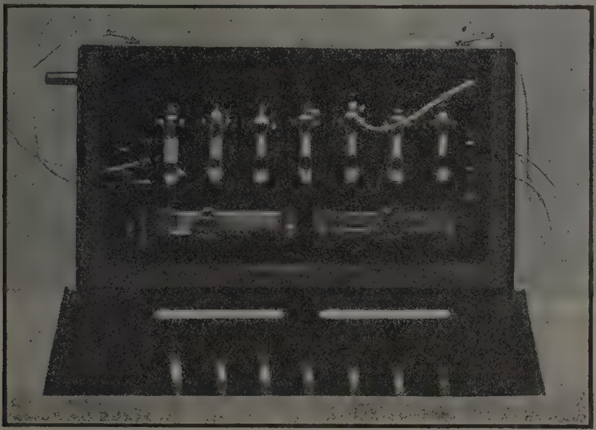

FIG. 8.—Marconi Co.'s type 55; thermionic amplifier with six amplifying valves and one detector as used in wireless telegraphy and telephony. (By permission of Marconi's Wireless Telegraph Co., Ltd.)

Directional Wireless.—The frame aerial has the important quality of being directive; that is, it tells us the direction in which the incident waves are travelling. Hence if two receiving stations at a known distance apart are provided with directive aerials, and if they simultaneously observe the direction of the arriving waves from one transmitting station, which may be on an aircraft or ship, these observations laid down on a chart will enable them to fix the position of the source of the signals. In this manner the position of aeroplanes lost in the clouds or ships in the fog may be found and their exact position communicated to them. There was a considerable development of this directive radiotelephony during the World War of 1914–8.[1] It has been found that there are peculiar difficulties in practising this direction finding at or about the times of sunrise and sunset.

In place of employing a movable frame aerial two fixed nearly closed circuit triangular aerials can be erected with their planes at right angles, and a resonant receiving circuit can be arranged to have a coil which is capable of rotation round a vertical axis but so as to be coupled inductively to both the fixed aerials by coils in the two aerial circuits. If electric waves fall on the aerials and if the movable coil of the receiving circuit is rotated into the azimuth in which it receives signals most loudly the direction of the plane of that coil will determine the line of direction of the transmitting station. It is possible by special arrangements to determine the direction along this line in which the electric waves are travelling. Many coast radio stations are now provided with direction finding aerials, and ships can call up these stations by wireless when in proximity, in case of fog, and have their bearings and exact position given to them. In another method of direction finding the coast station sends out a revolving beam of radiation which has a sharply marked point of zero radiation. The time of revolution of this beam is known, and also the instants when the zero radiation is in the true north and south direction at the sending station. Hence by observing the instants at which the zero radiation is observed at the ship, the ship's bearing with regard to the station can be determined. The station sends out time signals by which to correct the ship's chronometer.

Another ingenious application of radiotelegraphy has been made by Prof. J. Joly to enable ships to find their position in fogs and avoid collisions. For details the reader must be referred to his paper in the *Proceedings of the Royal Society* of London, vol. xcii., A, 1915–6, pp. 170, 176, 252, and also to a paper by H. C. Plumer on p. 377 in the same volume. See also J. Joly, *Proc. Roy. Soc.* Lond., vol. xciv, A, 1918, p. 547.

Wireless Telephony.—The above described improvements in the production and detection of continuous electric waves had by 1921, within a few years, placed wireless telephony on a thoroughly practical basis. It is unnecessary to describe various experimental feats which had been achieved at intervals in this art of radiotelephony, in which the Poulsen arc or some modification was employed to generate the continuous waves (C.W.). All practical radiotelephony now involves the use of the thermionic valve both as a generator of C.W. and as detector.

The general principles of this method are as follows:—one or more three-electrode valves are employed in which the plate and grid circuits are inductively coupled so as to generate continuous oscillations. The plate circuit is also coupled inductively to a radiating aerial wire and continuous waves sent off. The amplitude of these waves has then to be modulated in accordance with the wave form of a speech sound. This is done by means of another three-electrode valve called the control valve. The latter has the secondary circuit of an induction coil connected between its grid and filament, and in the primary circuit is a microphone transmitter and a voltaic cell or two. Hence if speech is made to the transmitter the potential of the grid is varied in accordance with the wave form of the speech. The plate current of this control valve is caused to act upon the plate current or grid potential of the oscillating valve so as to modulate the resulting high frequency oscillations also in accordance with the wave form of the speech made. At the receiving end the received oscillations are amplified by a series of valves and then rectified and passed through a Bell magneto-telephone. The speech sounds are then reproduced by the receiving telephone.

The advantage of this method is that only the ordinary standard telephone transmitter and receiver as used in telephony with wires are employed. To obtain the necessary high plate potentials in the oscillating valves we can either use voltaic batteries (dry cells) or else a small high tension direct current dynamo (1,000–2,000 volts), or else we can rectify a low frequency high tension alternating current by one or more Fleming valves. For aeroplane wireless telephony the plate voltage is supplied by a small dynamo driven by a wind screw which is set in action when the aeroplane flies. A large number of schemes for valve circuits for wireless telephone have been devised. During the war a great amount of ingenuity was expended in devising compact light weight sets of radiotelephone transmitters and receivers for use in aircraft and in the field (*see* figs. 9 and 9a). A problem of practical importance is that of two-way radiotelephony enabling two communicators to speak and hear simultaneously or to "cut in" or interrupt each other as can be done in ordinary telephony. If a single aerial wire has to be switched over from transmitter to receiver there is always risk of confusion owing to both operators trying to speak or listen at the same moment.

In the case of ground stations a practical solution is to use two wave lengths differing say by 5%. At each station there is a transmitter and a receiver say 100 yd. apart. One transmitter is tuned to the distant receiver but the wave length of the home receiver, which is tuned to the distant transmitter, differs by 5%. Each operator then speaks and listens on a different wave length and can "cut in" as he likes.

This method is, however, not applicable in the case of aeroplanes or ships for want of space. One suggested solution is that called the "quiescent aerial." The plate voltage of the oscillating valve is not supplied by a high voltage battery but at most by a few cells, and the remainder of the plate voltage is created by the rectification by the valve of the speech currents induced in the secondary circuit of the microphone transformer. In this case continuous waves are not thrown off from the aerial except in the act of speech to the microphone, and the receiver can then

---

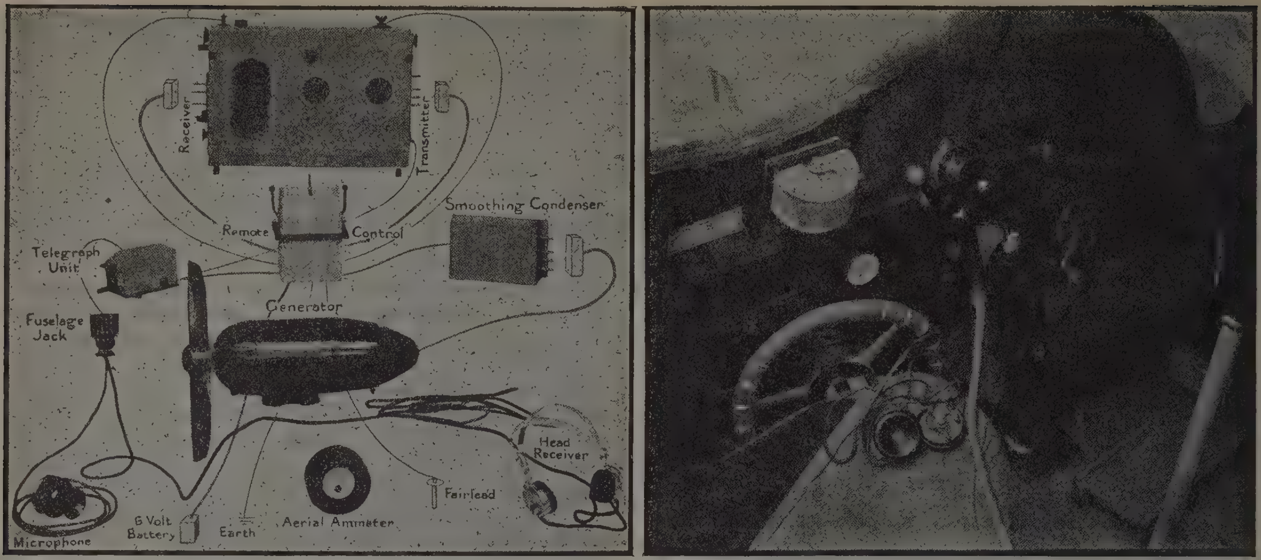

FIGS. 9 (left hand) and 9a (right hand).—The wireless equipment of an aeroplane for wireless telegraphy and telephony. The generator is fixed to the outside of the hull of the aeroplane and driven by a wind screw. Fig. 9a shows the general interior arrangement. (By permission of Marconi's Wireless Telegraph Co., Ltd.)

remain connected with the aerial. The arrangements will be understood from the diagram in fig. 9. The method is, however, not very successful and it cannot be said that two-way radiotelephony with a single aerial wire is a solved problem. On the other hand radio communication to and from aeroplanes up to 150 or 200 m. is now a thoroughly practical matter. The aerial is a wire about 230 ft. in length with a weight at the end which is unwound from a winch when the pilot wishes to communicate. The pilot generally wears a helmet with microphone transmitter opposite his mouth and two receivers over the ears. The transmission of speech from the aeroplane is more easy than reception owing to the great engine and propeller noises; nevertheless it is of immense use in connexion with air traffic as by it aircraft can be guided through the clouds to their destination, and the pilot informed of the conditions as regards fog or cloud at the landing station.

In May 1921 Marconi's Wireless Telegraph Co. carried out very successful demonstrations of practical radiotelephony on the two-wave system between Southwold in England and Zandvoort in Holland—a distance of 125 m. over the North Sea. The wave lengths used were 120 and 125 metres.

A very important use of the three-electrode valve is that of repeating speech currents from ordinary telephone wire circuits to wireless circuits and vice versa. Also this is perhaps the place to point out its extremely valuable qualities as a telephone repeater or relay for long wire circuits. Since the characteristic curve of the triode is nearly flat at the central part it follows that any irregular variations of grid potential are exactly copied by the corresponding variations of plate current. Hence if we connect the secondary terminals of a telephone transformer to the grid and filament of a valve and the primary terminals of another transformer to the plate and filament with plate battery inserted we shall have an arrangement called a *thermionic repeater*, which repeats and amplifies telephonic speech currents. If one or more such repeaters are inserted in a telephone line at intervals they will operate to neutralize the attenuation of the speech currents due to the resistance of the line and enable telephonic speech to be transmitted over larger distances without greater expenditure on the copper line conductor. Thus in the United States the long transcontinental telephone line from New York to San Francisco and Los Angeles has 13 such repeater stations in it, and speech is thus rendered possible over 4,000 m. of line.

In Oct. 1920 a remarkable feat was carried out in telephonic transmission by the aid of thermionic repeaters. A ship four hours out in the Atlantic spoke by wireless telephony to the mainland of the United States. The speech was then repeated into the transcontinental line from New York to Los Angeles and again repeated on to a radio circuit and delivered at Santa Catalina I. about 30 m. out in the Pacific. The speech transmission over this 4,000 m. was as perfect as over any exchange circuit in a large city. It is possible in this manner to speak to flying aeroplanes from the ordinary wire telephone of a town.

Long Distance Stations.—The above improvements in generation and detection of electric waves have not only made radiotelegraphy from ship to ship and ship to shore a certain and indispensable aid to navigation, but have enabled a multitude of long distance radio stations to be established which can maintain communication over distances of several thousand miles. It is now generally agreed that this possibility is due not to true diffraction of these long electric waves round the earth but to the fact that the higher levels of the earth's atmosphere are in a state of permanent ionization due to sunlight or extra-terrestrial causes. This creates a high level reflecting layer which guides the wave round the earth. There are, however, peculiar difficulties and effects at times of sunrise and sunset. In the United Kingdom the Marconi Co. have a large station at Carnarvon, Wales, near Snowdon, which is in correspondence with another at Marion, N.J., United States, for transatlantic working. The British receiving station is at Towyn, about 60 m. from Carnarvon, to enable reception and transmission to be carried out simultaneously. The direct effect of the Carnarvon radiation on the Towyn receiving aerial is neutralized by a balancing aerial (see British Patent Specification No. 13020 of 1911 of G. Marconi). The aerial at Carnarvon is a Marconi directional one, 3,600 ft. in length and 400 ft. vertical height supported on 10 tubular steel masts. The wave length of the radiation is 14,000 metres. The system of wave generation is the so-called timed-spark of Marconi. A direct current high voltage dynamo keeps two sets of condensers charged, and by means of a pair of rotating wheels with studs on their peripheries these condensers are discharged alternately through the primary coil of a transformer, the secondary coil of which is inserted between the aerial and the earth. These two sets of oscillatory discharges are made to follow each other in step and in close sequence by means of a trigger disk discharger which times two discharges so as to constitute in effect a continuous oscillation. The signalling is conducted by switches worked by compressed air which are operated through a relay by electric currents from Towyn. The same company have also a radio station at Clifden in Ireland which corresponds with another at Glace Bay, Nova Scotia. The Clifden station employs large thermionic valves as generators of continuous waves.

The Imperial Wireless Telegraph Committee which reported to Parliament in June 1920 recommended the thermionic valve generator for the imperial stations of the British Empire on the ground that the capital outlay would be less than for arc or alternator stations.

The high power radio stations in the United States comprise one at New Brunswick, N.J. which is equipped with Alexanderson alternators of 200 kilowatts capacity working on a wave length of 13,500 metres. The signals are made by means of a magnetic amplifier which is an independence coil, the impedance of which is varied by means of a small direct current which changes the permeability of the iron core (see *Proc. of the Institute of Radio Engineers*, United States, vol. iv, April 1916, p. 101; a magnetic amplifier for radiotelephony).

The Radio Corporation of America began to build in 1921 a very large wireless station on Long Island which was to have 12 directive aerials, each $1\frac{1}{4}$ m. long, arranged radially around the station. The waves were to be generated by high frequency alternators. The station would cover an area of nearly 10 sq.m. and be the most powerful in the world (see The *Engineering Supplement* of *The Times*, Aug. 1920). Another large U.S. radio station is that at Tuckerton, N.J., containing a Goldschmidt 200 kilowatts high frequency alternator. The radio frequency machine is driven by an electric motor supplied from two direct current generators in Ward Leonard connexion. This station was erected to correspond with one near Hanover, Germany. In France there are four very large radio stations; one at Croix d'Hins near Bordeaux, which was erected by the U.S. army during the war to maintain communications with Washington, contained originally 400–500 kilowatts Poulsen arc generators but is now partly converted to an alternator station. The aerial is carried on 8 lattice towers 800 ft. high (*see* fig. 10).

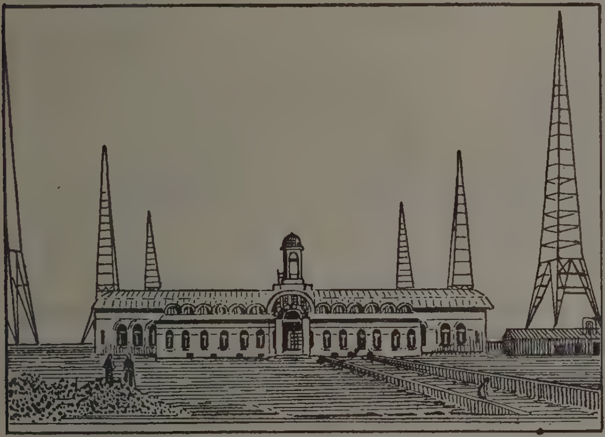

FIG. 10.—View of the large French radio station at Bordeaux erected by the American army during the World War for direct communication with the United States.

Another large French radio station at La Doua, near Lyons, with wave length of 12,000 metres is an arc station; a third exists at Nantes and a fourth is in Paris and employs the Eiffel tower to support its aerial wire.

The French Government began to erect in 1921 two large radio stations at St. Assise, near Paris, for European and world wide radiotelegraphy. These were to be equipped with Béthenod-Latour high frequency alternators and would have 1,500 kilowatts output.

In Germany there is a station at Nauen, near Berlin, which has a range of several thousand miles and wave length of 12,600 metres. This station like that at the Eiffel tower, Paris, sends out time signals at certain hours.

Broadly speaking, we may say that there were in 1921 about a dozen long distance radio stations in the world, which could signal to any part of the world by day or night, making use of wave lengths between 12,000 and 20,000 metres.

BIBLIOGRAPHY.—For the full discussion the reader must be referred to special treatises on radiotelegraphy as mentioned below. J. A. Fleming, *The Principles of Electric Wave Telegraphy and Telephony* (4th ed. 1919); R. Stanley, *Text Book on Wireless Telegraphy* (2nd ed. 2 vols. 1919); W. H. Eccles, *Continuous Wave Wireless Telegraphy* (1921); J. A. Fleming, *The Thermionic Valve in Radiotelegraphy and Telephony* (1918); W. H. Eccles, *Wireless Telegraphy and Telephony* (2nd ed. 1918); Bernard Leggett, *Wireless Telegraphy*, with special reference to the quenched-spark system (1921); J. A. Fleming, *The Scientific Problems of Electric Wave Telegraphy*, Cantor Lectures at the Royal Society of Arts (1919); also the following articles in the *Proceedings of the Institute of Radio Engineers*, United States, are authoritative and useful: vol. ii., 1914, 69, E. Van der Bijl, "Theory of the Thermionic Amplifier"; *Proc. Inst. Radio Engineers*, United States, vol. vii., 1919, 97, 603, H. J. Van der Bijl on the theory and operating characteristics of the thermionic amplifier; *Journal of the Institution of Electrical Engineers*, London, vol. lviii., 1920, p. 65, C. L. Fortescue, "The Design of Multiple Stage Amplifiers using Three-electrode thermionic valves"; *ibid.*, p. 670, B. S. Gossling, "Development of Thermionic Valves for Naval Use." For the discussion of the special difficulties introduced by the atmospheric electrical disturbances called "strays," which are vagrant electric waves produced by natural causes, the reader may be referred to a paper by Roy A. Weagant in the *Proc. Inst. Radio Engineers*, United States, 1919, vol. vii., 207, "Reception through Static and Interference." (J. A. F.)

WIRTH, KARL JOSEPH (1879–), German statesman, fourth chancellor of the post-war republican Reich, was born at Freiburg in Baden in 1879. The son of a working engineer, he was educated at the university of Freiburg. In 1908 he was appointed to the chair of Economics at the Technical College of that city; and after his election as a municipal councillor in 1911 he devoted himself to financial questions. In 1913 he obtained a seat as a member of the Catholic Centre party in the diet of Baden, and in 1918 was appointed Minister of Finance. In Jan. 1919 he was elected a member of the Constituent Assembly of the Reich which sat at Weimar. In March 1920, when the Ministry of the Reich was reconstructed after the Kapp *Putsch*, he received the portfolio of Finance, which he continued to hold in subsequent ministries. His task was to carry out the system of increased national taxation which one of his predecessors, Erzberger, had induced the Reichstag to adopt. When in May 1921 the Allied ultimatum on Reparation was presented to Germany and the "Sanctions" enforced on the Rhine, the Fehrenbach–Simons Ministry, which had rejected the London terms, resigned, and Dr. Wirth was called upon to form a new Cabinet. He succeeded in obtaining the coöperation of a number of able Democrats, Catholics and Socialists, including the prominent industrialist and economist, Dr. Walther Rathenau, as Minister of Reconstructions. Wirth himself retained the portfolio of Finance. The new Ministry then accepted the Allies' Reparation terms—132 milliard marks (£6,600,000,000) payable in yearly instalments of £100,000,000 plus the proceeds of a 25% duty on German exports. By Aug. 31 1921 Germany had paid the first half-yearly instalment of £50,000,000; and in the following Oct. Dr. Rathenau succeeded in concluding a comprehensive agreement with France for paying reparations in kind for the reconstruction of the devastated regions.

After the assassination of Erzberger on Aug. 26 1921 the conflict between the Government of the Reich and the reactionary Bavarian Ministry of von Kahr came to a head, von Kahr showing the same recalcitrancy against carrying out the special ordinances of the Reich against reactionary plots as he had previously exhibited in regard to the dissolution of the illegal volunteer force, the *Einwohnerwehr*. Dr. Wirth stood his ground, and ultimately von Kahr was compelled by his own party in Bavaria to resign and make way for a more conciliatory minister-president. The strife which arose out of this acute internal crisis had hardly abated when the announcement in mid-Oct. of the decision of the League of Nations on the partition of Upper Silesia between Germany and Poland aroused wild excitement throughout Germany, and, among other consequences, sent the exchange value of the mark down (Oct. 17) to 750 to the £. Dr. Wirth had not concealed his conviction that the severance from Germany of the rich industrial district of Upper Silesia would fatally affect Germany's capacity to pay further reparation instalments, and the political tension in Berlin again became acute. Eventually Dr. Wirth resigned, but nobody was found able to form a ministry in his place and he resumed office.

WISCONSIN (*see* 28.740).—In 1920 the pop. was 2,632,067, as compared with 2,333,860, in 1910, an increase of 298,207, or 12·8%, the state holding its rank of thirteenth. The density of pop. in 1920 was 47·6 per sq. m.; in 1910 it was 42·2. The proportion of urban pop. increased from 43% in 1910 to 47·3% in 1920. The following table shows the growth of pop. of those cities having 25,000 inhabitants:—

	1920	1910	Percentage increase
Milwaukee . . .	457,147	373,857	22·3
Racine	58,593	38,002	54·2
Kenosha . . .	40,472	21,371	89·4
Superior . . .	39,671	40,384	−1·8
Madison . . .	38,378	25,531	50·3
Oshkosh . . .	33,162	33,062	0·3
Green Bay . . .	31,017	25,236	22·9
Sheboygan . . .	30,955	26,398	17·3
La Crosse . . .	30,421	30,417	—

Agriculture.—The cultivated acreage was in 1919 8,979,000; in 1909 7,980,000. The number of farms in 1920 was 189,295; in 1900 169,795. These increases were due mostly to frontier advance. In the older part of the state, farms tended to become larger and fewer. Of the farms 84·3% were in 1920 in the hands of their owners. These farms produced in 1909 crops worth $138,000,000 and live-stock products worth $260,922,000; in 1919 $445,000,000 and $371,791,000, respectively. The food product per acre increased since 1885 37% as contrasted with 21% for the United States as a whole. The statistics of special crops year by year are meaningless if taken individually, as there is great yearly fluctuation owing largely to the confidence felt by the farmers in the market forecasts furnished in the *Bulletins* of the University of Wisconsin. For instance, in 1917 the university had advised increased tobacco acreage. When war was declared wheat was advised instead, and an unusual amount planted. This wheat acreage was later returned to other crops. There were in 1920 more silos than in any other state, Wisconsin seed had acquired a reputation and a market, and canning factories, creameries, etc., situated near the point of production, fitted raw products for the market. Relatively the leading feature was dairying, in which Wisconsin stood first among the states. The increase in dairy cows from 1,474,000 in 1910 to 2,180,000 in 1920 was attended by great improvement in quality.

Manufactures.—The total value of manufactured products ($695,172,002 in 1914) was not much below that of farm products, but the value added by manufacture was only $277,756,928. The number of establishments rose from 8,558 in 1904 to 9,104 in 1914. Between the same years the number of workers rose from 173,572 to 230,272. The Lake Michigan region showed the greatest growth, owing to the greater cheapness of coal, which is all brought into the state. The great increase in the use of water-power was chiefly for lighting and transportation. In certain industries closely related to agriculture there was a tendency toward decentralization. The manufacture of farm products took first place, although flour decreased, and beet-sugar remained stationary. This position was due chiefly to the expansion of the dairy interests, butter, cheese, condensed and malted milk, etc. In 1880 the lumber cut was 1,542,021,000 ft., mostly white pine; in 1918 1,275,000,000 ft., largely hard wood. The value of lumber products in 1914 was $55,363,000; 473,840 tons of wood pulp for paper, worth $22,049,498, was produced. In 1914 Wisconsin ranked fifth among the states in the value of furniture produced, its value being $22,586,531. Leather remained in 1914 the fourth industry in the state, with a product of $55,362,511. Foundry and machine-shop products were in 1914 $60,698,000, a 12·1% increase over 1909.

Mines and Quarries.—The output of iron ore grew steadily, reaching 1,167,640 tons in 1918. The production of pig-iron increased rapidly, being in 1900 184,794 tons, and in 1919 605,619 tons.

Forests.—The forests still constituted in 1920 one of the great resources of the state, but of decreasing importance both absolute and relative. Measures for fire protection were increasingly effective. Surveys were in progress to determine what of the cut-over region should be reforested and what turned to farm land. The earliest Wisconsin industry, the fur trade, still produced, in 1918, a value of $669,005.20.

Fisheries.—The development of the fisheries was constant. New hatcheries were established at Spooner for pike, at Sturgeon Bay for white fish, and at Sheboygan for blue fin. In 1918 247,079,876 eggs were distributed. The commercial fishing was mostly in the Great Lakes where the catch in 1918 was valued at $792,040. This was less important than the sport fishing under licence in the rivers and streams.

Transportation and Commerce.—The railway mileage in 1917 was 7,667. It varied from year to year owing to the laying and taking up of logging lines. The main system had been complete for years, the state standing fourteenth in the proportion of mileage to area. About 1900 there began a movement for interurban electric lines, and a system was developed extending from the southern boundary to Janesville and to Milwaukee, and up the Fox river valley. In 1919 the mileage of all electric roads, urban and interurban, was 760. There was no recent extension of the interurban system, and suburban extension was less after 1910 than before, owing to the increased use of automobiles. In 1920 there were 277,093 automobiles, and 16,205 motor-trucks in the state. This development of automobile traffic occasioned a demand for better roads, and extensive plans were in process of completion. In the years 1912–8 $23,086,152 was voted for highway construction by local, county and state authorities. Concrete roads proved successful where the foundation was placed below the frost line.

Government.—A constitutional amendment in 1910 granted the state power to acquire and develop water powers and forests; one in 1912 regulated the borrowing capacity of cities and incorporated villages; another in 1912 gave the state powers for creating a park system; and one in 1920 for the enforcement of the prohibition amendment to the U.S. Constitution. In 1911 the salaries of justices of the Supreme Court were increased to $7,500. A law of 1915 allowed voting by absentee electors under certain circumstances, and one of 1918 arranged for voting by enlisted soldiers. The following state boards and commissions were created in or after 1905: Accountancy (1913), Compensation Insurance (1917), Conservation (1915), Engineering Department (1915), Grain and Warehouse (1905), Health (reconstituted 1913), Highways (1911), Industrial (1911), besides boards of examination for licences for architects, boxers, barbers, plumbers, etc., and *ex-officio* boards.

Miscellaneous Laws.—The cigarette prohibition law was repealed (1915), and the laws directed against out-of-the-state insurance companies were modified. A workmen's compensation law was passed in 1911. A law of 1917 provided for the sterilization of defectives and laws of 1913, 1915, 1917 provided for an antenuptial physical examination for men.

Finance.—In 1918 there was raised for general state purposes $14,281,216, the largest item of income being $5,370,305 from the railway companies; of the total, $5,986,661 was returned to the counties in aid of schools, tuberculosis sanatoriums, highways, etc. The tax levy of 1918 produced $12,142,121 for the use of counties, $22,580,567 for cities, towns and villages, and $16,444,671 were school and school district rates. The state income taxes of 1916, paid in 1917, amounted to $9,482,595, of which $603,762 went to the state and the rest to localities in lieu of the general property tax.

Education.—In 1915 a State Board of Education was provided to correlate the educational undertakings of the state. The most important new departure was with reference to vocational education, for which a Board was provided in 1915. A law of 1917 increased the effectiveness of compulsory education for those between 9 and 14; in 1915 aid in transportation was provided for those attending school at a distance from home; 32 cities in 1920 maintained continuation schools. In 1920 the total educational expense by the state and localities was $25,901,282; $2,779,072 for the university, $1,427,959 for normal schools, $10,024,095 for city schools, and $11,361,692 for town and country schools, toward which a great effort at improvement was being made.

History.—Gov. McGovern, elected in 1911, continued the progressive policy inaugurated by Gov. La Follette. The activities of the state Government were increased, their administration being given to commissions composed in part at least of recognized experts, and similar commissions were given power of supervision and control over private activities. The extension of this policy led to a reaction in 1914 and Emanuel Phillip was elected governor on a somewhat reactionary programme. The break, however, proved to be less violent than many expected, and the main features of the legislation of the preceding 10 years were continued. The outbreak of the World War divided sentiment in the state perhaps more than elsewhere in the country. In the 'fifties some German leaders had hoped to make the state essentially German and a centre in America for the development of German culture, as New England was for English Puritanism, but turned to liberalism. This project had failed, but a large element in the state was German-born or of German parentage, and many communities retained German habits and language, and educated their children in Catholic or Lutheran schools conducted in German. While this element was by no means solid in sentiment, the majority sympathized with Germany as opposed to Great Britain and her Allies. When the question arose of the entrance of the United States into the war, this element was opposed to it, and was reënforced by a powerful sentiment in favour of peace. The national representation of the state was divided. Senator La Follette voiced the peace sentiments, and was one of those characterized by President Wilson as "a little group of wilful men." Senator Husting, a Democrat, supported the Wilson administration. The death of Senator Husting necessitated a senatorial election in the spring of 1918, which attracted wide attention as a test of public opinion in the state which was thought least likely to support the war. An active campaign of education was conducted, by means of pamphlets, speeches and organization. The result was the choice in the Republican primaries of Irvine L. Lenroot, who was pledged to support the Administration in its war policy, and who defeated the Democratic candidate in the election which followed. Later Senator Lenroot broke with President Wilson on his peace policy, taking a stand for moderate reservations in the plan for a League of Nations. This stand was endorsed by his reëlection for the regular senatorial term in 1920, when the state gave a large majority also to Harding. In the gubernatorial election of that year, the successful candidate, Mr. Blaine, represented in general the La Follette views, maintaining that the stand taken by that senator was not disloyal, but legitimate opposition. Although many regretted the necessity of fighting Germany, the number who failed to support the United States was negligible.

Gov. Phillip proved an efficient war administrator, working in harmony with the national officials and organizing extremely effective state and local machinery to handle the problems that constantly arose. The state met and exceeded every demand made upon it, for men and for money; the draft was put into operation with success; the administrative effectiveness which had been developed in the preceding 10 years was everywhere in evidence. Wisconsin troops repeated the record they had made in the Civil War. A war history commission planned to put the war record in substantial shape for the future. The Wisconsin National Guard served on the Mexican frontier, 1916–7, and was called into national service for the World War in 1917; its aggregate strength, Aug. 4 1917 was 15,266. The losses of troops from Wisconsin in France were given as 5,735; 71,790 were accepted at camp under the draft laws. To the five Liberty loans $471,194,250 was subscribed. The United War Work Campaign of 1918 produced $4,546,706. Besides this a million had been raised for the Y.M.C.A., nine millions and a quarter for the Red Cross; 8,503 French orphans were adopted, and generous contributions made to all causes of war aid and relief.

The governors of Wisconsin after 1911 were: F. C. McGovern, Republican, 1911–5; Emanuel Phillip, Republican, 1915–21; John J. Blaine, Republican, 1921– .

Howe, *Wisconsin, an Experiment in Democracy* (1912); C. McCarthy, *The Wisconsin Idea* (1912); J. B. Winslow, *The Story of a Great Court* (1912); F. Merk, *Economic History of Wisconsin in the Civil War Decade* (1916). (C. R. F.)

WISE, BERNHARD RINGROSE (1858–1916), Australian lawyer, was born at Sydney Feb. 10 1858, the second son of Edward Wise, Judge of the Supreme Court of N.S.W. He was educated in England at Rugby and Queen's College, Oxford, where he won the Cobden prize and was *proxime* for the Lothian Historial Essay, finally graduating 1st-class in law. He was also a prominent athlete, and represented Oxford in the mile race against Cambridge. He was called to the bar at the Middle Temple (1883), then returned to Australia, was elected to the N.S.W. legislature and became Attorney-General of N.S.W. 1887–8, and Q.C. in 1898, being again Attorney-General from 1899 to 1904 and, in addition, Minister of Justice 1901–4. For part of 1903–4 he was Acting-Premier of N.S.W. He did distinguished service to the cause of Federation but was defeated in the elections for the first Commonwealth Parliament, and his abilities therefore were never called upon for Federal service. From 1915 until his death, Sept. 19 1916, he was acting as Agent-General for N.S.W. in London.

WISTER, OWEN (1860–), American writer, was born in Philadelphia July 14 1860. He was a grandson of Frances Anne Kemble (*see* 15.724). On graduating from Harvard in 1882 he intended to devote himself to music. He went abroad for study; but ill-health forced him to return to America, and he spent several years in Arizona and New Mexico. He then entered the Harvard law school, graduating in 1888, was admitted to the bar in 1889 and for two years practised law in Philadelphia. Thereafter he gave his time to literary work. As an undergraduate he had contributed a poem, *Beethoven*, to the *Atlantic Monthly* in 1882. His subsequent publications include the *Modern Swiss Family Robinson* (1883); *The Dragon of Wantley: His Tail* (1892); *Lin McLean* (1898); *The Virginian: a Horseman of the Plains* (1902); *Philosophy 4: a Story of Harvard University* (1903); *Lady Baltimore* (1906); *The Seven Ages of Washington: a Biography* (1907); *Members of the Family* (1911); *The Pentecost of Calamity* (1915, a condemnation of Germany for the World War), and *A Straight Deal: or the Ancient Grudge* (1920). His novels, *The Virginian* and *Lady Baltimore* in particular, established his position as one of the foremost of contemporary American writers. He became a member of the National Institute of Arts and Letters and of the Société des Gens de Lettres de France, and in 1912 was elected a member of the Board of Overseers of Harvard.

WITTE, SERGE JULIEVICH, COUNT (1849–1915), Russian statesman (*see* 28.762), died in Petrograd March 12 1915. His diaries were posthumously published by the Soviet in Pravda in 1918, and a study of his career as Minister of Finance during 1892–1903, by D. A. Lutokhin, appeared in 1915. The *Memoirs of Count Witte*, translated from the original Russian MS. and edited by Abraham Garmolinsky, were also published in New York and in London in 1921.

WOËVRE, BATTLES IN THE, 1914-8.—The military importance of the great plain which separates the Metz ridges from the line of heights along the Meuse was evident as soon as the frontier of 1871 was drawn. On its N. side, a strip of bold undulating country, the axis of which may be taken as Montmédy–Thionville, skirts the Belgian and Luxemburg border, while at the S. it narrows, as the Meuse and Moselle converge toward Toul, to a blunted end facing the Haye Plateau and Toul. Along the Meuse (Verdun–Toul) and along the Moselle (Thionville–Metz) both sides gradually crowned the heights with permanent fortifications. The plain itself, through which the frontier ran along no very well defined line, was not fortified, each side treating it as a sort of foreground or glacis. Generally speaking, this frontier line left the plain to France, but the French ground immediately adjacent to the frontier was practically under the fire of the Metz guns. Hence the war outpost line, which was to protect the concentration of the French main armies, was drawn well back—almost to the verge of the Meuse heights—and no attempt was made to hold the frontier region itself.

This proved, in the sequel, to be of enormous importance. For, from about the end of the 19th century, vast mineral resources had been discovered in the Briey basin or Eastern Woëvre; this lay on both sides of the frontier, and was at the outbreak of war being developed by a Franco-German syndicate. From the military point of view—a short, purely military war being in prospect—no great importance was attached by the French to the evacuation of an untenable stretch of country, but when the war became a prolonged, and largely an economic, struggle, the German occupation and exploitation of the Briey area became a most important asset to the Central Powers.

Nevertheless, after the battle of the Marne and its concomitant fighting on the Meuse died away in Sept 1914, no major offensive took place in this area until the American attack of Sept. 1918. The reasons for this quiescence on the French side were not allowed to appear during the war, and are still rather obscure.

In the following article are described (1) the bitter trench-warfare fighting which—without ever becoming a major offensive—went on continually in 1914–5, around the salient of St. Mihiel—the base of which was the Woëvre plain—and (2) the American operations, which, carried out on a large scale and without reserve, reduced the salient in two days in 1918. (C. F. A.)

(I.) HAUTS DE MEUSE AND WOËVRE, 1914–6

On Sept. 19 1914 the right wing of the French III. Army was carrying out an offensive advance from the Hauts de Meuse in the direction of Mars-la-Tour when the VIII. Corps encountered at Woël an advanced guard of the German army which was being led toward the Hauts de Meuse by Gen. von Strautz. Before the engagement at Woël had assumed any great importance it was suspended by the arrival of an order from Gen. Joffre to the effect that the VIII. Corps was to proceed immediately to Ste. Menehould, where it was to remain in general reserve. Consequently the Germans found themselves confronted only by reserve troops, not yet inured to war, and dispersed over a wide front, when they launched their attacks against the Meuse heights on the 20th and following days.

At Vigneulles Gen. Grand d'Esnon of the 75th Res. Div. was killed and the enemy surmounted the Hauts de Meuse. Before long the German heavy artillery was bombarding the forts of Lionville and Géronville toward the S. and Camp des Romains in front. On Sept. 24 St. Mihiel was in the hands of the Germans, who tried to gain ground W. of the Meuse but could not get beyond Chauvoncourt. In the N. von Strautz's army was held by Gen. Pol Durand's group of reserve divisions which had come to the assistance of the VI. Corps. Toward the S. it was attacked by the XVI. Army Corps at St. Baussant and by the VII. Cav. Div.

The region of Léronville–Marbotte was without defenders, but the Germans did not advance in the direction of Commercy, as their aim was to encircle Verdun. To this end the German Crown Prince attacked to the S. of Varennes and in Argonne simultaneously and the French III. Army thus found itself threatened both to the N. W. and to the S. of Verdun.

The 15th Div. of the VIII. Corps was brought back to Chaumont-sur-Aire to the III. Army Reserve, ready to hasten either to the aid of the V. Corps in the Argonne or toward Chauvoncourt to help the 75th Res. Div.

The 16th Div. was transported by train from St. Menchould to Léronville–Sampigny and placed under the orders of the I. Army headquarters, for the purpose of covering Commercy, and was reinforced on Sept. 28 by the Belfort Brigade. From this moment von Strautz's army, which was composed of Bavarians, had its III. Army Corps bottled up at St. Mihiel and so the "Hernia," called also the "Wedge," came into being. From Les Eparges to the Meuse S. of St. Mihiel, the III. Army put in line the VI. Corps and part of Gen. Pol Durand's group. The Bislée peninsula and the front Koeur-la-Grande–Brasseitte–St. Agnant were held by the VIII. Corps with the 16th Inf. Div. and the Belfort Bde. To the E., in the region of the Bouconville ponds in Woëvre, was the 7th Cav. Div. Still farther eastward the XVI. Corps was attacking fiercely at St. Baussant, urged on by the determined commander of the I. Army.

The zone S. of the St. Mihiel wedge and Woëvre and N. of Toul was assigned to the I. Army. The point of liaison between the I. and III. Armies was on the Meuse below Bislée. Before long the III. Army was put under the command of the I. Army and it was therefore Gen. Dubail who was matched against Gen. von Strautz.

At first the Germans tried to debouch from Chauvoncourt, but without success. Elsewhere, both in the S. and the N., they made every effort to enlarge the wedge while the French attacks were directed toward diminishing it. Hence there resulted partial engagements at Chauvoncourt, in front of Les Paroches, at Les Eparges near the Hauts de Meuse, in the Bois d'Ailly, in the Bois Brulé, near Apremont, and at St. Baussant.

For the beginning of April 1915, Gen. Dubail ordered an attack on a large scale from the N. and the S. to be delivered by several army corps. A force designated the army detachment Gérard, including the I. and II. Army Corps, the Verdun Provisional Div., and the I. Cav. Corps, opened the attack on April 5 and took possession of Fromezey, Gussaniville and l'Hôpital farm (in the region of Étain), but broke down before the intact German wire—for in the marshy ground the artillery projectiles buried themselves deeply.

In conjunction with the attack by Gérard's force an attack was launched by the XII. Corps and VIII. Corps which, however, had no particular results. The fighting lasted from the 5th to the 22nd without achieving anything but the exhaustion of both attackers and defenders.

From that time forward the struggle resolved itself into a series of partial combats. The names Les Eparges, the Tranchée de Calonne, Chauvoncourt, Bois d'Ailly, Bois Brulé, Seicheprey, Bois le Prêtre recur day by day in the *communiqués* of 1915.

On May 5 1915 the VIII. Corps lost in one morning all the ground which it had taken several months to gain in the Ailly wood. There was even a moment when a gap in the line seemed to be broken through and the way opened to Commercy; but the counter-attacks came in time to regain part of the Bois d'Ailly, and restore the situation. In the course of one of these counter-attacks in the woods, a company of the 172nd, led by Commandant d'André, crossed five lines of German trenches in succession and came within sight of St. Mihiel. But here they were confronted by German reserves and surrounded. For three days these heroes resisted all attacks, having nothing but their rifles and the German grenades picked up in the fifth line of trenches. They finally succumbed to hunger and thirst. Justly indeed was this trench named "the thirst trench." When Gen. von Strautz saw Commandant d'André on the day after the fighting was over, he said, "*Vous avez été deux fois blessé, vous étiez au Bois d'Ailly, vous êtes un brave.*"

At Bois le Prêtre, near the Moselle, the fighting was incessant and for the most part to the advantage of the French.

At Les Eparges it was mine warfare. In this the Germans had generally the upper hand, but, as at the Bois d'Ailly and the Bois le Prêtre, the upper hand did not imply the gain of ground desired. In mine warfare the Germans had a very considerable advantage over their opponents in the matter of equipment and especially of boring tools. At the outset the galleries they made in the Crete des Eparges and the colossal dimensions of their mine chambers astonished even the men of the II. Corps, recruited though many of them were from the mining country of the Nord. But, though astonished, they were not dismayed, and feeble as their implements were, they often took their revenge for the mine attacks to which they were subjected.

The characteristic of the army of 1915 was the poverty of its material in comparison to that at the disposal of the enemy. In it was learned the lesson that a nation poor in coal and iron must shed much blood to save itself from slavery.

When in Sept. 1915 the Champagne offensive was launched, quiet set in on the front Les Eparges–Chauvoncourt–Bois d'Ailly–Bois le Prêtre. On both sides, the forces on this front were milked to obtain quality and quantity on the field of the great battle. When it died down, the battered formations came back to rest and recruit—and also to fight, for activity began again in Nov. and Dec. 1915.

In Feb. 1916 the storm burst at Verdun, and in July the other storm on the Somme. Then the front with which we are concerned became so calm that the commander of the VIII. Corps called the Wedge of St. Mihiel a convalescent home.

Here and there, now and then there was a *coup de main*, but the only result was to show both sides the necessity of not relaxing vigilance. The year 1917 came and went without changing either the positions or the attitude of the two parties. The great British offensive of Arras, the great French offensive on the Aisne, the Franco-British battles of Ypres absorbed all the offensive power of the adversaries on the western front. Not till 1918 did the sector Les Eparges–Chauvoncourt–Bois d'Ailly–Bois le Prêtre become again the scene of victory.

In concluding this survey of operations on the front between Les Eparges and the Moselle, it is necessary to underline again the poverty of material and munitions under which the French army laboured. Not only did it possess little heavy artillery, but even the 75's, excellent for barrages, diminished daily and were replaced by B.L. guns of 90 and 95 mm., obsolete since 1900. Track for light railways could not be had. Boring tools were so short that mine warfare in the Forest of Apremont had to be waged with pick, chisel and crowbar. Ammunition was served out by spoonfuls, and at one moment the commander of the eastern group of armies had only 350 rounds per gun for his 75's—half an hour's battle allowance.

These conditions were, of course, not peculiar to the front under consideration, and are introduced here to enable the reader to see how the Higher Command was obliged to apply the great Napoleonic principle of economy of force; to show how it was possible for the Crown Prince to break in the Verdun front or, for that matter, the whole front from the Meuse to Switzerland, for the defenders were few, their guns few, and their shell very few.

But it may be seen, too, how a German success was bound always to remain without a sequel, for it was through this conception of the economy of forces that Joffre was able always to keep in hand strong, rested reserves, free guns and unallotted ammunition. (V. L. E. C.)

(II.) Battle of St. Mihiel (Sept. 12 to 14 1918)

For four years the St. Mihiel salient had projected 28 km. deep into the French line, constituting alike a menace and an invitation to attack. Its original purpose, to serve as one of the jaws of a nutcracker attack on Verdun, having failed, it was used in 1916 as the anvil against which von Falkenhayn sought in vain to drive home his hammer-blows against Verdun from the north. In 1918 Ludendorff again hoped through its possession to gain Verdun and much more by the wider encircling attack in Champagne of July 15, but again the attack failed. During all these years also it had remained not only a threat of further German aggression but a serious interruption of French railway communication with Verdun and also with the Lorraine front. In 1915 the French army had twice attacked to compel evacuation of the salient but both attacks had failed, the first, made in April at Les Eparges, with serious losses.

Tactically, the salient afforded a strong defensive position. The Côte de Meuse, a range of hills rising abruptly 500 metres above the Meuse valley on the W. and the Woëvre plain on the E., afforded strong supporting points on the western face of the salient, while Mont Sec and the lower-lying hills S. of the Rupt de Mad were well adapted to a strong defensive organization.

To the general staff of the American Expeditionary Forces the reduction of the St. Mihiel salient had appealed strongly as a favourable initial or try-out operation for the American army as soon as sufficient forces should have arrived to undertake it. The reason for this selection was not so much the material gain to be reaped from it as the consideration that the fresh and eventually preponderant American force should preferably be employed against a part of the line where it could strike a vital blow to the Germans. Metz, the centre of important railway communications and surrounded by coal and iron fields, obviously presented itself as such a region, and, in addition, while the American forces were being gathered for the later major operations, the same installations and lines of communication needed for them could be utilized by the earlier arriving troops to gain an initial success on a smaller scale, mainly for moral effect though also as a factor in troop training.

General Pershing had discussed this view with General Pétain in June 1917, and, after further study of the front, port facilities and railway lines, this had been adopted as the working plan. However, the slowness of the transportation of troops to France during the first year of American participation in the war, and the exigencies caused by the success of the German offensive operations in the spring of 1918, caused the plan to be temporarily laid aside, and, during both spring and summer of that year, American troops in France and arriving were scattered along the western front to meet needs of the moment.

By the end of July the situation had stabilized sufficiently in favour of the Allies to enable the question of reuniting the troops of the American army to be taken up. On July 24 Marshal Foch confirmed the understanding arrived at the previous year, that the first American operation should be the reduction of the St. Mihiel salient, and, a few weeks later, he authorized the transfer to the I. American Army of that sector of the Allied front facing the salient. This transfer occurred on Aug. 30.

By this time the American army consisted of forces far beyond the number requisite for the mere reduction of the salient and the question of their subsequent employment arose. General Pershing desired to exploit the St. Mihiel attack to the utmost; Foch, however, with other plans and considerations in mind (*see* Meuse–Argonne, Battle of), limited the attack strictly to the forcing of the salient, although Pétain, in a conference on Sept. 2, sided with Pershing in desiring the American army to gain at least the German "Michael" position across the mouth of the salient.

By Marshal Foch's direction, Pétain, on Sept. 2, issued the directive for the operation which called for a main attack on the S., to debouch from the plateau Seicheprey-Limey toward the objective Vigneulles–Thiaucourt, and a secondary attack, to debouch from the vicinity Eparges–Mouilly toward the S.E., and in connexion with the main attack, to effect the cutting off of the German forces in the salient. To the main attack there were assigned eight American divisions; to the secondary, one American and one French; the French troops occupying the intermediate sector were to exercise "pressure" against the enemy forces on their front. The wording and the date of this directive and the disproportionate number of American divisions assigned to the main attack, which alone could hope speedily to reach the *Michel Stellung*, suggest that it was originally drafted to carry out Pétain's conception of at least a partial exploitation of the attack, to include the seizure of the *Michel* position, and that, in a subsequent alteration to conform to Foch's insistence on a more limited scope, only the names of the objectives were changed.

General Pershing's order for the attack assigned the main attack to the I. and IV. Corps with two regular divisions to each corps; the secondary attack, on the Côte de Meuse, to the V. Corps, the attacking troops to consist of one American National Guard Div. and one French division; the French II. Colonial Corps in the centre was to guard the adjacent flanks of the main and secondary attacks, to execute deep raids and to be prepared to follow up a withdrawal. At the disposal of the American I. Army for the operation were 2,971 guns, mostly French artillery. The I. Army also had a marked superiority in aviation, thanks to French coöperation and the assistance of the British Independent Air Force.

On the German side the salient was held by Army Detachment C, under Gen. von Fuchs and comprising, on Sept. 12, the date of the attack, eight divisions on the line, organized as three corps groups, and three in reserve.

As early as Sept. 1 a deserter had given the Germans warning of the impending attack, and Ludendorff had at the time seriously considered ordering a withdrawal from the salient, but was deterred by the representations of the army detachment and army group commanders who were confident of their ability to hold, and also by reports from Duke Albrecht's army group in the Vosges region, of American preparations for attack farther south. These feints which General Pershing had caused to be made in the vicinity of Belfort had led to German uncertainty as to the real intentions of the American commander. By Sept. 8, however, the evidences of a coming attack on the salient had become unmistakable and Army Detachment C was ordered to withdraw to the *Michel Stellung*. No need for haste was felt and the preparations were deliberate and methodical. The night preceding the attack the dismounted batteries were being withdrawn and consequently could not be used in the battle.

Preceded by a four-hour bombardment the main attack was launched at 5 A.M., Sept. 12; the secondary attack at 8:30. Deprived of artillery support the German infantry though ordered to hold, made virtually no resistance. The American I. Corps on the right made its objectives in a few hours, and, in spite of German counter-attacks brought by two divisions against it and against the right of the IV. Corps but beaten off, begged permission to continue its advance; but, because of the precise instructions by which the American staff felt itself bound, this permission was refused. The IV. and V. Corps also made their objectives and halted, awaiting orders.

Army H.Q. in this battle, as also in the earlier part of the Meuse–Argonne battle, appears to have had little conception of the difficulty and time required in the transmission of orders on the battlefield and in consequence to have left but little initiative in the hands of subordinates. The result was that the orders for the troops of the IV. and V. Corps to move forward to Vigneulles and effect the cutting off of the salient did not reach the troops concerned until after dark on the 12th so that the connexion, though unopposed, was not effected until the morning of the 13th. Meanwhile the German commander, realizing his hopeless situation, had ordered the evacuation of the tip of the salient, which had not been attacked, and during the night the movement was successfully carried out except for the loss of about 1,000 stragglers.

In the course of Sept. 13 and 14 the troops of the American IV. and V., and French II. Colonial Corps moved forward without serious opposition to the line designated by Marshal Foch facing the German *Michel* position and which the I. Corps had already reached on the 12th.

On the German side the attack showed a complete demoralization in the Higher Command and a lack of initiative in the lower officers. The men showed little will to fight. The advance of the left division of the IV. Corps with one flank uncovered and of the American division of the V. Corps with both flanks uncovered was nowhere taken advantage of.

In regard to the halting of the American offensive the German general staff, in a study of the St. Mihiel attack published for the information of the armies shortly after its occurrence, while giving high praise to the dash and fearlessness of the American soldier, added that the army H.Q., which showed itself so unable to reap the advantages so clearly afforded by its striking initial success, was not to be feared. It is not impossible that Foch, had he himself been in immediate command of the I. Army on the morning of the 12th, or had he been present, might, in view of the manifest military advantages, have felt justified in permitting the Americans to grasp the opportunity offered to complete the destruction of Army Detachment C and to seize and hold the *Michel Stellung*. Indeed Pétain, on the night of the 13th, learning that the German army behind the sector was in great disorder and that the American troops on the right had reached and in some instances gone beyond their objectives, did send an authorization to take the *Michel* position; but by the time this permission was received the opportunity of taking the position cheaply and completing the German rout had passed. Tactically, Foch's avowed purpose would have been better served had Pétain, as long as he was going to prescribe dispositions in detail for the American army, originally called for two main attacks from the two faces of the salient to meet in the centre the first day, advances which the Soissons attack had already shown could be easily made by American regular troops.

Of the troops engaged on the Allied side the Americans aggregated 550,000, the French 110,000. American losses were 7,511, of which considerably more than half were borne by the I. Corps which received the brunt of the counter-attack; French losses were 597. The captures included over 15,000 prisoners and 443 guns. (A. L. C.)

WOLFE-BARRY, SIR JOHN WOLFE (1836–1918), English engineer, was born in London Dec. 7 1836, the youngest son of Sir Charles Barry (*see* 3.443), architect of the Houses of Parliament. He was educated at Trinity College, Glenalmond, and King's College, London, and became a pupil of Sir John Hawkshaw, whom he assisted in the building of Charing Cross and Cannon St. stations and railway bridges. In 1867 he set up for himself, becoming well-known as a railway engineer and traffic expert. Through his initiative and energy the British Engineering Standards Committee was established in 1901, a great step forward in effecting railroad economy. He was made a K.C.B. in 1897. He died in London Jan. 22 1918.

WOLSELEY, GARNET JOSEPH WOLSELEY, VISCT. (1833–1913), British field-marshal (*see* 28.777). The closing years of Lord Wolseley's life were spent in virtual retirement. His health gradually failed, and on March 25 1913 he died at Mentone, the title going by special remainder to his only daughter, Frances. His eminent service to the State had not been forgotten, for he was accorded an imposing public funeral and was buried at St. Paul's; an equestrian statue of him on the Horse Guards Parade was unveiled in 1920. It had not been Lord Wolseley's good fortune to hold responsible positions in the conduct of warfare on a great scale, but he was undoubtedly a brilliant commander in the field. His campaign in Ashanti and his overthrow of Arabi Pasha were model operations of their kind, while the failure to save Gordon and Khartum in 1885 was attributable to delays in starting the expedition, for which he was not responsible. His labours in modernizing the organization and developing the efficiency of the British army—often in face of strong opposition—were of incalculable value to the country. He proved himself at the War Office to be an energetic, far-seeing and able administrator. His insistence upon officers fitting themselves for the duties that they would have to perform in war, and upon their taking their profession seriously, was to bear rich fruit in days when he had retired into the background. An excellent judge of men and of character, he was extraordinarily successful in his choice of subordinates. Cultured, possessing varied interests, well read and of wide experience in many lands, he was in private life a man of unusual charm.

WOLVERHAMPTON, HENRY HARTLEY FOWLER, VISCT. (1830–1911), English statesman, (*see* 28.781), died at Woodthorne, Wolverhampton, Feb. 25 1911.

WOMAN SUFFRAGE.—In the earlier article (under WOMEN, 28.786), the story of the movement for woman suffrage was brought down to 1910. The narrative may here be continued for the United Kingdom up to the passing of the Representation of the People Act in 1918, with some estimate of its results up to 1920, followed by accounts of the growth of woman suffrage in other countries.

UNITED KINGDOM

In the later years of the agitation in Great Britain the constitutional suffragists concentrated their efforts on the formation of public opinion: they sought to form a non-party, non-militant suffrage society in every parliamentary constituency and brought local influence to bear in contested elections to obtain promises of support from candidates of all political parties. They were so far successful as to secure a majority of members pledged to their support in every House of Commons elected since 1886: and in that year, and also in 1897, 1908, 1909, 1910 and 1911, woman suffrage bills passed their second reading, but made no further progress, each successive Government declining to give facilities for the passage of the bills into law. At this period the movement was receiving very valuable support from platform, press and pulpit, besides remarkable help from the theatre in plays by leading dramatists of the day.

In Parliament for several years important support had been given to woman suffrage by leaders of the Conservative party. Among them may be mentioned three successive Conservative Prime Ministers—Lord Beaconsfield, Lord Salisbury and Mr. Arthur Balfour—besides the 7th Duke of Rutland and Lord Iddesleigh, while the younger generation were ably represented by the Earl of Lytton, Lord Robert and Lord Hugh Cecil, and Mr. Alfred Lyttelton. On the Liberal side the leaders, with a few important exceptions (which included Sir H. Campbell-Bannerman, Mr. Lloyd George and Sir Edward Grey), were against it. Among the strongest Liberal opponents during the generation before the World War were to be found Mr. Gladstone, Mr. John Bright, Mr. Joseph Chamberlain, Sir W. Harcourt, Mr. Labouchere, and Mr. Asquith.

In 1908 the death of the suffragist Sir H. Campbell-Bannerman and the succession of the anti-suffragist Mr. Asquith to the Liberal premiership were very disadvantageous to suffrage prospects in the House of Commons. This misfortune was, however, partly counteracted by the emergence of the Labour party, the leading members of which were convinced suffragists; in a short time they induced the party to make woman suffrage a plank in their platform.

The question of "militancy" on the part of a section of the woman suffragists was mishandled from the first by the Liberal Government which came into power in 1906. The Women's Social and Political Union, led by Mrs. Pankhurst and her daughter Christabel, which came into existence about this time, confined its activities to asking inconvenient questions of members of the Government at public meetings. This was in itself a perfectly legitimate method of propaganda. Instead of meeting it by giving reasonable answers, the questions put were in many instances met only by shouts of anger and disapproval or, when written on paper, were contemptuously torn and thrown on the ground. Later, if persisted in, those who asked them were treated with shameful violence. A man at Bradford in 1911, brutally thrown out of a meeting by Liberal stewards, had his leg broken. Women were "frogmarched" out of meetings, and while thus absolutely helpless were violently struck on the face with fists or umbrellas by men in the audience. It should always be remembered that between 1905 and 1908 the militants never answered violence by violence; they suffered violence, but used none. In 1908 they definitely abandoned this policy of non-retaliation; to the last, however, they set limits for themselves, and never shed one drop of blood of either man or beast. But they smashed windows, set fire to churches and country mansions when they were empty; burnt down the refreshment pavilion at Kew Gardens when no one was in it, destroyed the contents of letter-boxes and in one instance of a ballot-box at an election; slashed and cut the Rokeby Venus by Velasquez in the National Gallery and the portrait of Henry James by Sargent in the Royal Academy, and destroyed a case of pottery in the British Museum. On June 4 1913 Emily Wilding Davison tried to upset the Derby favourite during the race at Epsom, and died four days later from her injuries. Her funeral on June 14 was made the occasion of an imposing procession through London.

These and similar actions were intensely irritating, and the punishments meted out were correspondingly severe. But long before violence had been attempted groups of women had been sentenced to three months' imprisonment for nothing worse than making speeches in the lobby of the House of Commons, or shouting in the street. The severe sentences passed upon those who had been guilty of real violence were in the later stages rarely carried into effect; for the militants adopted the hunger strike, and after an interval of, in some cases, only a few days were released because public opinion would not have exonerated the Government if these women had died in their hands. Parliament then passed a piece of panic legislation called Prisoners (Temporary Discharge for Ill Health) Act 1912, immediately nicknamed the "Cat-and-Mouse Act," which enabled the Government to rearrest the hunger strikers when they gave signs of restored vitality. The principal result of this Act was the ridicule which it created at the expense of the Government. Public opinion was greatly excited by all these proceedings. Suffrage was a universal subject of conversation. Anti-suffragists had believed that "militancy" would kill the suffrage movement, and therefore the utmost publicity had been given to every act of violence and to every intemperate speech. But so far from killing the suffrage movement the all-pervading discussion stimulated it as nothing else had ever done. Everyone, high and low, was talking about woman suffrage, arguing either for or against it with vehemence and conviction.

It was a difficult time for the law-abiding suffragists. They objected to "militancy" because they believed the use of physical force as political propaganda was invariably mischievous. They were firmly determined to roast their pig, but not to do it by burning down their house. Over and over again the National Union of Women's Suffrage Societies issued strongly-worded protests against "militancy," and they excluded militants from membership of their societies. They deprecated the use of "frightfulness," whether used by the militants or against them, and urged repeatedly that the real cure for violence was the redress of the grievances which had given rise to it. The fact that men under somewhat similar circumstances had been much more violent and destructive did not create the desire to imitate them. Serious differences thus naturally arose between the two branches of the suffrage movement. Each held firmly to its own view of the case. The militants bitterly resented criticism and made organized efforts to prevent its expression by trying to break up the meetings of the law-abiding suffragists. One effect of this situation was that for the first time since 1886 woman suffrage bills were defeated in the House of Commons, once in 1912 and once in 1913. But other circumstances had contributed to these defeats. There were two general elections in 1910—in Jan. and December. Mr. Asquith and his party emerged victorious from each of them, but in the second his majority was greatly reduced, having fallen from 334 to 124. He had promised at a public meeting in Dec. 1909, if returned to power, to bring in a Reform bill and to allow a woman suffrage amendment to the bill to be an open question for the House to decide. At a later date, in answer to a question in the House, he said, just before the second general election of 1910, that, if his Government were still in power, it "would give facilities for proceeding effectively with a woman suffrage bill, if so framed as to admit of free amendment." The *Times* parliamentary correspondent said that this made woman suffrage an issue before the country at the coming election, and that a majority for the Government would mean that Parliament had received a mandate to carry a measure to that effect. Mr. Asquith was again returned to power, and shortly after these two general elections, *i.e.* in July 1910 and in May 1911, the House of Commons carried by immense majorities second readings of the measure known as the Conciliation bill.

This bill was of a very limited character, proposing to enfranchise only about one million women householders, and it was from the outset opposed by Mr. Lloyd George on the ground that it was not sufficiently democratic. The second reading in 1910 was, however, carried in spite of his opposition. After the general election in 1911 suffrage prospects seemed particularly bright; militancy had been suspended in order to give the Conciliation bill a chance; all the suffrage societies were working harmoniously together, and were relying on Mr. Asquith's promise that, if the bill were given a second reading, opportunities should be afforded in the following session for "proceeding effectively" with its further stages. A bombshell from Mr. Asquith shattered these favourable prospects. He announced on Nov. 7 1911, to a deputation from the People's Suffrage Federation, his intention of introducing during the session of 1912 the electoral Reform bill he had foreshadowed in 1908. He said that this bill would sweep away all existing franchises: that the new franchise would be based on citizenship, and votes were to be given to "citizens of full age and competent understanding," but no mention was made of women. Mr. Asquith, on being asked what his bill would do for them, dismissed the inquiry with the curt remark that his opinions on the subject were well known and had suffered no change; but he reiterated his promises of "facilities" for the Conciliation bill in the session of 1912. If he intended to provoke a return to militancy nothing could have been better calculated to do so. A violent outbreak at once took place. Windows were smashed in the principal shopping streets of London, and personal assaults were made on members of the Government. The constitutional suffragists were as angry as the militants, but had a different way of showing it. Many strong suffragists in the Women's Liberal Federation broke away from their party and gave all their energies to the suffrage cause. Some knowledge of this may have reached Mr. Asquith, for before mid-Nov. he took the unusual course of inviting representatives of the whole woman suffrage movement, militant and non-militant, to attend in a deputation to him: this unprecedented invitation was at once accepted for Nov. 18. The N.U.W.S.S. prepared a series of four questions to put before him:—

1. Was it the intention of the Government that the Reform bill should be passed through all its stages in the session of 1912?
2. Will the bill be drafted in such a manner as to admit of amendments introducing women on other terms than men?
3. Will the Government undertake not to oppose them?
4. Will the Government regard any amendment enfranchising women which is carried in the House of Commons as an integral part of the bill, to be defended by the Government in all its stages?

To each of these questions Mr. Asquith gave the answer, absolutely unqualified: "Certainly." He further said, referring to his own position:—

> "It is perfectly consistent with the self-respect and the best traditions of our public life that, in relation to a question which divides parties, not only the head of the Government but the Government itself should say that, if the House of Commons on its responsibility is prepared to transform or extend a measure which we are agreed in thinking necessary—a measure for the franchise as regards men—and to confer the franchise on women, we shall not only acquiesce in that proposal, but we shall treat it as the considered judgment of Parliament and shall make ourselves responsible for carrying it out."

Twenty-six days after this Mr. Asquith received a deputation of anti-suffragists to whom he gave free rein to an expression of his entire sympathy with their position, and to whom he declared that he regarded "the grant of the parliamentary franchise to women as a political mistake of a very disastrous kind." It was never disclosed how he could reconcile his promise to the suffragists to make himself and his Government responsible, if the House so desired, for carrying woman suffrage, with his belief that it would prove a political mistake of a disastrous kind. His words to the second deputation went far to make his promises to the first worthless; many of his followers interpreted his meaning to be that he relied on them to deliver him, as one of them expressed it, from "the humiliation" of having to keep his word. The first step in his deliverance would be the defeat of the Conciliation bill, and the usual parliamentary devices were employed to secure this end. One of these was to detach from the support of the bill the members of the Irish Nationalist party. This was done by making them believe that the success of woman suffrage would break up the Government and thus prevent the third ratification by the Commons of the Home Rule bill necessary to secure (under the Parliament Act) its passage into law notwithstanding its rejection by the House of Lords. These tactics, aided by a coal strike which caused the absence of 13 Labour members in their constituencies, were successful, and the Conciliation bill, which had been carried on second reading on May 5 1911 by 255 to 88, was defeated on March 28 1912 by 222 to 208. It was a heavy blow to the women's cause, and the most perturbing feature to suffragists in this defeat was the conviction that the same unscrupulous tactics which had secured it would be put into operation against the woman suffrage amendments to the Government Reform bill.

When this was produced it was called a Franchise and Registration bill. It came on for second reading on July 12 1912. In his speech Mr. Asquith took full advantage of the recent defeat of the Conciliation bill. He said: "This bill does not propose to confer the franchise on women; whatever extensions of the franchise it makes are to male persons only." He then referred to the defeat of woman suffrage in March as the "considered judgment of the House," and he dismissed as "an altogether improbable hypothesis the possibility that the House would stultify itself by reversing this judgment during the same session." Notwithstanding this ominous warning Mr. Lloyd George and Sir Edward (afterwards Viscount) Grey continued to be confident that amendments to the Government bill gave suffragists the best chance they had ever had of parliamentary victory. The bill itself, however, made no further progress during 1912; the protracted session lasted all through that year and overflowed into 1913; it was officially announced that committee stage would be taken on Jan. 24. All possible plans were elaborated by the real friends of woman suffrage both inside and outside Parliament to ensure the success of one or other of the suffrage amendments. But the parliamentary air was still thick with intrigue, and many and circumstantial were the rumours that the success of any of the woman suffrage amendments would mean the resignation of anti-suffrage ministers and the break-up of the Government. No official contradiction was given to these rumours until the day before the House was expected to go into committee on the bill.

But the defeat of the bill did not proceed from this source. Three days from Jan. 24 had been allotted for the discussion of the woman suffrage amendments. This stage was, however, never reached. On Jan. 23 Mr. Bonar Law asked the Speaker to give a ruling on the point whether the Government's own amendments, regarding the occupation franchise for men, did not so far alter the bill from that which had received a second reading in July as to make it a new measure and necessitate its withdrawal and reintroduction in its new form. In his reply the Speaker intimated that this was his view, and added that there were "other amendments regarding female suffrage which of course would make a huge difference to the bill if they were inserted." The bill was killed by this ruling. Mr. Asquith did not mend the situation by his treatment of the suffragists, from whom he refused to receive a deputation, and they were more incensed against him than ever when, in lieu of what he himself called "the best chance they ever had," he only offered parliamentary time for the discussion of yet another private member's bill. All the suffrage societies repudiated this offer and did nothing to support the bill, which was brought forward in May 1913 and defeated by 266 votes to 219.

These events, the defeat of the Conciliation bill in March 1912 and the fiasco of the Government bill in Jan. 1913, convinced the N.U.W.S.S. that nothing would now be of any use but a Government bill with the whole weight of the party behind it. They accordingly gave a new interpretation to their election policy. This was, and continued to be, to support the best friend of woman suffrage; but events had proved that a suffrage candidate who belonged to a suffrage party was a better friend than a suffrage candidate whose party was either hostile or neutral. The council governing the N.U.W.S.S. therefore resolved "that in judging which of the two pro-suffrage candidates should be supported in an election, the official attitude of the party to which the candidate belongs should be taken into consideration." An analysis of the division when the Conciliation bill had been defeated showed that 42 members who had been supported by the N.U.W.S.S. as "best friends of woman suffrage" (mostly followers of Mr. Asquith) had voted against it. When party pulled one way and voteless women pulled the other, party proved the stronger. As Labour was the only party which had definitely made suffrage part of its programme, this change threw the influence of the N.U.W.S.S. in elections definitely on the side of Labour; and a special fund, called the election fighting fund, was formed for the support of Labour candidates. The N.U.W.S.S. further resolved under no circumstances to support Government candidates, and to endeavour by all legitimate means to strengthen any party which adopted woman suffrage as part of its programme. By the adoption of this policy they succeeded in 16 months in defeating six Government candidates in by-elections, making a difference of 12 in divisions. They had also succeeded in each of the elections concerned in making the whole place ring with the suffrage agitation. Public opinion moved rapidly and strongly in the suffrage direction, the general view being that suffragists had received less than fair play at the hands of Mr. Asquith and his Government.

A "pilgrimage" organized by the N.U.W.S.S. in 1913 received a remarkable degree of support from the towns and villages traversed on the seven routes by which it approached London. But the N.U.W.S.S. were convinced that a free vote of the House of Commons on their question was an impossibility as long as there was a Prime Minister who was ardently opposed to his own principles when applied to women. They were therefore determined to do everything in their power to reduce Mr. Asquith's majority. They believed that their election-fighting policy gave them an effective and constitutional method of doing this, and looked forward to helping to defeat his party in the general election which, but for the World War, must have taken place not later than 1915. They were full of work in preparation for this, when on Aug. 4 1914 the overwhelming catastrophe of the World War broke out, not only destroying all opportunity of suffrage work but jeopardizing the very existence of representative institutions in Europe.

Suffragists shared to the full in the solemn national consciousness that every ounce of strength would be needed in the gigantic effort which the successful prosecution of the war demanded. Indeed, suffragists realized this more quickly than the Government, which for many months seemed to believe that the war could be carried on solely by the efforts of the male half of the nation, without disturbance of the domestic calm which they believed to be the only legitimate role of the female half: for offers of help from women to provide, and staff hospitals to supply, women for work in public offices, thus leaving an additional number of young men free for military service, were plentifully douched with cold water.

Nevertheless suffragists, whether militant or non-militant, quickly faced the facts and clearly saw what their duty was. The militants instantly abandoned every sort of violence and organized themselves for public service. They formed a Women's Emergency Corps, ready to undertake all kinds of national work which the exigencies of the time required. Others, both militant and non-militant, in spite of official discouragement undertook the organization of hospital units entirely officered by women (*see* WOMEN'S WAR WORK). The N.U.W.S.S. committee on Aug. 3 resolved to suspend immediately all political propaganda and to use their staff, and organizing power in mitigating the distress caused by the war. Their societies, numbering over 500, were consulted by post, and all but two approved this course.

No one claims for suffrage women that they were in any degree singular in the devoted work which they gave to their country during the war. The suffragists were earliest in the field because they were already organized and accustomed to team-work. Women of all classes and all parties threw themselves with zeal and efficiency into every kind of useful patriotic work. Industrial women were beyond all praise, working as they had never worked before, early and late, Sundays and weekdays, to supply the armies with every kind of military equipment. Everyone who came into contact with them bore testimony to their splendid efficiency in departments of skilled work from which before the war they had been rigidly excluded. In March 1915 the Government concluded an Agreement with the trade unions, known as the Treasury agreement, to suspend during the war, in face of the national emergency, the rules excluding women from most of the skilled trades. The Treasury on its part gave a promise not to use the women as a reservoir of cheap labour, and agreed to give women the same wages as men for the same output. This gave an important stimulus to the principle of equal pay for equal work, and went some way also in the direction of establishing industrial freedom for women. The courage of the women in the dangerous trades was as marked as their efficiency. On one occasion 26 women were killed and 30 injured by an explosion; those who remained uninjured displayed the greatest coolness and discipline, and were prompt both in helping the wounded and in continuing the work of the factory. The legend of the innate timidity of women was thus undermined. The tide in this direction rose so high that even Mr. Asquith was floated by it, and in speaking in Oct. 1915 in the House of the heroic death of Edith Cavell, he said: "She has taught the bravest man among us a supreme lesson of courage; yes, and there are thousands of such women, *but a year ago we did not know it.*"

All through 1916 evidence of the conversion of former opponents of women's enfranchisement poured into the suffrage offices. Many of these conversions were of M.P.s, eminent leaders of the press, railway managers, commercial and financial magnates. Liberals very often pleaded militancy as an excuse for their former blindness; Conservatives, in the main, said simply: "I formerly opposed the granting of the vote to women; I thought men by themselves maintained the state; I was wrong; the women have served their country so magnificently that henceforth I shall support their having the vote."

There is no doubt that by 1915–6 the country was by a great majority favourable to the enfranchisement of women. Nevertheless it would have been impossible to induce Parliament to pass a great Reform bill during the war if it had not been that the electoral position of millions of men, caused by their services to their country, was so anomalous as to amount to a public scandal. The parliamentary register, by the direct orders of the Government, had not been revised since 1913. By 1916 it was completely out of date. By-elections had proved its unrepresentative character and it would have been a moral impossibility to take a general election upon it. There were at this time the names of about 8,000,000 men on the register. Of these nearly 7,000,000 qualified as occupiers. The occupation franchise necessitated that the qualifying premises should have been continuously "occupied" by the voter for 12 months since the last 15th July. This meant that a large proportion of the 5,000,000 young men who had voluntarily joined the New Armies since Aug. 4 1914 would, in consequence of their patriotic services, have lost their claim to the parliamentary vote. The men facing death daily, the very men to whom the country was most indebted, would be voteless, whilst those who had evaded similar sacrifices retained their electoral qualification. The position was intolerable, but it was not at first clear how best to amend it. Proposals were made by some M.P.s to create a new franchise based on naval or military service. But this received little general support. The questions: "Why exclude industrial service?" and "What about the services of women?" received no satisfactory answer. Mr. Asquith's Government repeatedly tried to deal with the situation by Special Register bills. These efforts were unsuccessful. Each successive proposal was rejected by the House of Commons with growing symptoms of exasperation. The House wanted a Reform bill; it demanded a new electorate on democratic lines. The Government wanted a Reform bill too, but appeared to believe they could get one to their liking by calling it a Special Register bill. It was long before they abandoned their efforts to get one thing by calling it another. On Aug. 14 1916 Mr. Asquith, on introducing yet another Special Register bill, announced his conversion to woman suffrage; he based it on the ground that when the war was over it would be necessary to revise industrial conditions and that in his view women had a special claim to be heard on the many questions which would directly affect their interests. It was obvious that this was no new condition. Ever since Parliament existed measures had come before it vitally affecting the well-being of women, but on which they had no constitutional means of making their claims heard. But it was not the business of suffragists to point this out. The main difficulty at the moment arose from the plausible plea that, however desirable parliamentary reform might be, it was not the time during the greatest war in history, with the issue still hanging in the balance, to recast the representative system of the country. The reply has just been indicated. The new register and the new qualifications were needed at once unless millions of the most desirable male citizens were to be disfranchised. A good deal of iteration was needed to hammer this into people's heads, and to the end, "This is not the time," continued to be the only effective weapon used against women's enfranchisement.

Mr. Walter (later Lord) Long found a way out of the impasse. He suggested the appointment of a non-party conference, consisting of members of both Houses, selected and presided over by the Speaker, to consider the whole subject of electoral reform including woman suffrage. Mr. Asquith concurred and the House agreed. The conference began its sitting in Oct. 1916 and handed in its report on Jan. 28 1917. In the interval Mr. Lloyd George had succeeded Mr. Asquith as Prime Minister, a change very favourable to immediate action in the direction of woman suffrage. The Speaker's conference unanimously recommended a new franchise for men amounting practically to manhood suffrage; for women it recommended, but not unanimously, household suffrage, including wives of householders, a higher age-limit for women and their admission to the university franchise. This was the scheme subsequently adopted by Parliament. The object of the high age-limit (30) for women was to produce a constituency in which male voters were in a substantial majority. It was believed by suffrage members of the conference that the acceptance of this was essential to success. The anticipated proportion of women to men in the new electorate was as 2 to 3. This expectation proved practically correct. The new register published in 1919 gave the exact numbers: men 12,913,160; women 8,479,156. It may here be mentioned that the United Kingdom is the only country, out of the 28 where women are enfranchised, which created a difference in the qualifications for men and women.

The parliamentary history of the measure based on the recommendations of the Speaker's conference may, as regards woman suffrage, be here sketched. Within a fortnight of his becoming Prime Minister, Mr. Lloyd George intimated to the leaders of the N.U.W.S.S. that he was keen to go forward at once in the direction of women's enfranchisement. This was a month before the Speaker's conference handed in its report. The object was to get an agreed measure supported by every party in the House. This was achieved. On March 28 1917 Mr. Asquith moved a resolution in Parliament calling on the Government to introduce a Representation of the People bill based on the recommendations of the Speaker's conference. Woman franchise was the subject of all the speeches, and the leader of every party supported the enfranchisement of women; the opposition was of the feeblest, and the motion was carried by 341 to 62.

When the bill (*see* WOMEN, LEGAL STATUS OF) was debated, the second reading was carried by 329 to 40, and Clause 4 (enfranchising women) was passed by 385 to 55, or 7 to 1, with a majority within each party into which the House was divided; and again in the last trial of strength the anti-suffrage Die-hards were reduced to a mere handful, the numbers being 214 to 17. After this the N.U.W.S.S. felt the ground sufficiently solid beneath their feet to place a new weight upon it, and, in conjunction with many other women's societies, they urged that the local government franchise for women should be amended on the same principle which the House had already accepted for the parliamentary franchise—namely, to include not only householders but wives of householders. This was at first resisted by the Government, but suffragists outside the House and even many anti-suffragists worked vigorously for it and prevailed. The Government gave way, and the amended clause was accepted on Nov. 14 without a division.

The anti-suffragists in the Lords were a more formidable group than in the Commons. Lord Curzon, president of the Anti-Suffrage Society, was the leader of the House and chief representative of the Government. The inclusion of women in the bill was vigorously resisted in the early stages of the bill by Lord Bryce and Lord Balfour of Burleigh; but there was no real fight upon it until the committee stage was reached and the women's clauses came on. After various skirmishes the battle was joined, an anti-suffrage amendment was moved, and there was a full-dress debate on Jan. 8, 9 and 10, 1918. Lord Curzon wound up the discussion. His speech, for the first five-sixths of it, was a tolerably familiar anti-suffrage oration, but the last sixth was cast in a different mould. He reminded the peers that the House of Commons was the sole constitutional representative of the feelings of the country; that in the Commons woman suffrage had been supported by large majorities of every party, "including the one to which most of your lordships belong." He invited them to contemplate what would happen if they came into collision with the other House on such a question as the representation of the people. He elaborated this point with skill, and ended by saying that to reject the clause would be to embark upon a conflict in which the Lords were certain to be worsted. He declined to be responsible for such a catastrophe, and announced his intention of not voting either for or against the amendment. This was the supreme moment for all suffragists present. They felt at once they were safe without disastrous conflict. The division was: for the clause, 134; against, 71. Thus ended the 50-years' struggle of British women for political liberty. The royal assent was given on Feb. 6 1918. The women's task had been a long one, but they were able to look back upon it with satisfaction. They had accomplished it without one scintilla of direct political power and without appeals to party passion. Their appeal had been to common sense and experience. They challenged their opponents to produce one instance of disastrous consequences following upon the women's vote. Moreover, they had not split the country into rival factions, for the bill was carried by the consent and coöperation of all parties.

Those who had worked for woman suffrage quickly perceived the difference it had made in the attitude of Parliament on almost every proposal which came before it. The parliamentary atmosphere completely changed. Measures for which women's societies had been working unsuccessfully for years, such as the Nurses' Registration bill, and an amended Midwives' bill, were taken up as Government measures, and passed through all their stages without difficulty. The grille in front of the ladies' gallery was removed, and women were admitted to the strangers' gallery. By the spontaneous action of the Government a bill was passed in Nov. 1918 to render women eligible to sit in Parliament. It was not in time to be of much use at the general election which followed in about a fortnight, but Viscountess Astor was returned for Plymouth in Nov. 1919 and Mrs. George Wintringham (widow of the previous member) for the Louth division of Lincs. in Sept. 1921. The increased number of women local electors gave a great impulse to the election of women as town and county councillors and the number of women chosen as mayors steadily increased.

The report of the Lambeth Conference 1920 showed that the Anglican communion was breathing the new atmosphere created by the women's vote. It acknowledged that in the past the Church had undervalued women and had too thanklessly used their work. It stated the belief of the Conference that the Church would be strengthened by making freer use of the spiritual gifts of women, and recommended the opening to them of the diaconate, definitely affirming that the diaconate is an "order," though a minor one, and that a woman appointed to it is not merely "set apart" but "ordained."

These changes vary in importance, but they are significant in that they all point in one direction—giving wider scope to the powers and responsibilities of women and recognizing the use of women's work in every well-ordered state.

Before the general election of Dec. 1918 Mr. Lloyd George and Mr. Bonar Law had given a public promise, if returned to power, "to remove all the existing inequalities in the law between men and women"; but when the new Parliament opened there was no indication in the King's speech of proposed legislation in fulfilment of this pledge. The Labour party, therefore, in the session of 1919 introduced a measure called the Women's Emancipation bill, completely removing every legal inequality between men and women and giving women the vote on the same terms as men. This they carried, notwithstanding Government opposition, through all its stages in the House of Commons; the Government, however, defeated it in the Lords, but not without providing a substitute—the Sex Disqualification Removal Act. This did not reopen the franchise question, but it gave women the right to study and practice law in both its branches, to act as magistrates and to sit on juries. It also made it clear to the universities of Oxford and Cambridge that they had the power to admit women to degrees and membership. Oxford availed itself of these powers without delay, but Cambridge in Dec. 1920 declined to take a similar step by 904 votes to 712, and repeated the refusal twice in 1921.

BRITISH DOMINIONS OVERSEAS

The granting of woman suffrage in Canada was almost simultaneous with its victory in England. It was first adopted in the provinces (except Quebec) in 1916, and by the Dominion in 1917. Canada was well in front of the mother country in the matter of the eligibility of women. Miss MacAdams was elected to the Legislature of Alberta entirely by the votes of soldiers on duty in England and France in July 1917. The first Woman Suffrage Act for the Dominion limited the vote to women who had near relatives serving overseas. Full woman suffrage followed very quickly and almost without opposition in March 1918. In Feb. 1921 Mrs. Mary Ellen Smith of Vancouver was chosen as Speaker of the British Columbian legislature. She, however, declined the speakership, but took office as a member of the Cabinet.

New Zealand had enfranchised its women in 1893, and enfranchisement followed in the Commonwealth of Australia in 1902; therefore, with the exception of S. Africa, all the great self-governing overseas dominions of Britain have given political freedom to women. In March 1921 Mrs. Cowan was elected to the Parliament of Western Australia, the first woman M.P. to be elected in Australia.

Jamaica, S. Rhodesia and British East Africa gave votes to women in 1919 and 1920.

A strong effort was made by Indian women, supported by the Aga Khan and the Begum of Bhopal, to induce Parliament to incorporate in the Government of India Act the principle of woman suffrage. This effort was unsuccessful but not fruitless; important support was given in the House of Commons, and the Act, as finally passed, specifically left the question of woman suffrage to be decided, province by province, by the elected Legislatures of India herself. The newly created constituencies therefore have the power, when they choose to use it, of recognizing the full citizenship of women.

UNITED STATES

American women had been the earliest to make a definite organized struggle for political freedom, having started in 1848, but they were among the last to win. This was in part due to the U.S. Constitution, which can only be amended by a two-thirds majority in both chambers of Congress, and even then the amendment does not become operative until it has been ratified by three-fourths of the 48 states. American suffragists used to say to friends in Europe, "You have to convert one Parliament: we have to convert at least 37 Parliaments." The suffragists worked state by state until there were some 20 suffrage states. The greatest victory thus gained was that in the state of New York in 1917, after America had joined in the war. To win in the "Empire" state was a turning point in the whole struggle. After this, ultimate victory was certain, and the suffragists concentrated on carrying suffrage by constitutional amendment. Theodore Roosevelt in 1912 was the first important presidential candidate who supported woman suffrage. In 1916 and 1920 all the presidential candidates were suffragists. President Wilson during his second term aided the movement by taking the unprecedented course of himself twice urging the Federal amendment upon the attention of Congress. The necessary two-thirds majority was secured in the House of Representatives in Jan. 1918, but there was not a single vote to spare, and the narrow margin weakened the position, especially as the Senate had yet to be won; but in May 1919 the amendment was again brought up in the House and was carried by 304 to 48; and victory in the Senate followed almost immediately. Then came the battle for ratification in 36 states. The first stages were easy and rapid, 11 states giving a unanimous vote in both Houses, and seven more in one or other of their chambers. After this the victories came more slowly until, in May 1920, 35 states had ratified and only one more was needed. The issue was much obscured by the impending presidential election. Both candidates were, as in 1916, suffragists. Both parties probably believed they would gain an advantage if they could plausibly claim that their efforts had given the final victory to women. Tennessee, a Democratic state, voted for the amendment by the necessary majorities in Aug. 1920; legal objections to its validity were, however, raised, but not in time to prevent the proclamation by the Secretary of State in Washington that the 19th Amendment to the U.S. Constitution had been carried. The legal points, however, awaited decision in the High Court. This gave an opportunity for a Republican state, Connecticut, to come to the rescue; a special session was called and the 19th Amendment was ratified on Sept. 21 1920. This made the Tennessee objections negligible for, valid or invalid, the 36th state had now ratified and the following article was added to the Constitution: "The right of citizens of the United States shall not be denied or abridged by the United States or by any state on account of sex." Thus after a struggle of 70 years the women's victory in America was completed.

OTHER COUNTRIES

Before the World War there were only four countries in the world where women exercised the political franchise; by the end of 1920 there were 28—namely, the United Kingdom, Canada, Australia, New Zealand, British East Africa, Rhodesia, Jamaica, Denmark, Norway, Sweden, Finland, Iceland, Holland, Rumania, Serbia, Luxemburg, Germany, Austria, Hungary, the United States; and, among the states newly formed by the peace treaties of 1919, Poland, Esthonia, Lithuania, Latvia, Czechoslovakia, the Ukraine and Palestine.

The charter of the League of Nations contains a clause rendering women eligible for all appointments, including the secretariat. This clause did not remain a dead letter. Besides a large number of women in less responsible positions, Dame Rachel Crowdy was made Director of the Section of National Health, to deal with the white-slave and opium traffic and with the anti-typhus campaign. At the first assembly of the League (Geneva Nov., Dec. 1920) Sweden appointed Mrs. Wicksell and Norway Dr. Kristine Bonnevie as alternate representatives of their respective countries; while Miss Forchhammer of Denmark brought forward in the full assembly the subject of the white-slave traffic and was successful in carrying her proposal to appoint a commission of three persons, one of whom must be a woman, to prosecute a special inquiry on the subject in the Near East. Miss Sophie Sanger was made head of the Legal Section of the International Labour Bureau. In Jan. 1921 Mrs. Wicksell was appointed a member of the Permanent Mandates Commission.

In seeking a cause for so great a development of principles for which comparatively small groups of women, without any direct political power, had worked in some countries for more than half a century, it may probably be found in one circumstance common to them all. In each country a national crisis had arisen on the issue of which the whole fate of the nation depended. National feeling in each had been stirred to its utmost depths. Under its pressure class feeling was minimized; all sorts and conditions of men and women had worked and suffered together for what each felt to be a cause of supreme importance. Men and women acted as friends and comrades when the issue was uncertain, and when the end came the men did not forget the work and the sacrifices of the women. In all countries, whether victors or vanquished, it was universally acknowledged that all through the anguish of the war the women had not been backward either in self-sacrifice, courage or capacity. It was this feeling which broke down the opposition to women's votes in nearly all the warring nations. It was felt also that men by themselves, as a well-known journalist expressed it, had made a mess of the world and needed helpers; men and women together being generally more successful than either men or women by themselves.

G. F.)

WOMEN (*see* 28.782).—The decade 1910–20 saw not only an advance in the position of women, unparalleled in any similar period, throughout the civilized world; it saw also an entire reversal of the public attitude towards their claim to equal citizenship. Yet this is true only of the second half of the period. From 1910–4 there was little or no progress; there was indeed retrogression. By 1910 the "Woman Movement" of the later 19th century had very largely resolved itself into a movement for obtaining the parliamentary franchise, a concentration upon a single object deplored by some but defended by others, who contended that the denial to women of the full rights of citizenship constituted an effective check upon their advance in any direction. The rise and progress of "militant" suffragism in England between 1910 and 1914 (*see* WOMAN SUFFRAGE) did much to alienate public sympathy. It was only the outbreak of the World War which brought about that great and sweeping reform in the position of women which had been accomplished by 1920.

(1) UNITED KINGDOM.—After 1914 changes in the United Kingdom were both numerous and rapid. The shortage of man-power during the war opened up a great diversity of fields of employment (*see* WOMEN'S WAR-WORK), and broke down barriers in the Civil Service and the learned professions, which had hitherto seemed impregnable. Nothing more was heard in the great war departments of those "structural" and other insuperable obstacles to the coemployment of men and women, which figured so largely in the evidence of practically every male civil servant before the Royal Commission on the Reform of the Civil Service, reporting in April 1914. When the institution of the two new orders of honour, the Companions of Honour and the Order of the British Empire, was announced in June 1917, it was declared that the bestowal of these decorations for war services would be irrespective of sex. In Aug. 1917 a resolution to remove the grille in front of the ladies' gallery of the House of Commons was passed by that House without debate. By the

Representation of the People Act (1918) women over 30 gained the parliamentary vote, and by a special Act passed in Nov. they were made eligible as members of Parliament, though the only woman elected at the general election of that year, Countess Markiewicz, refused, with the other Sinn Feiners, to take her seat. The Sex Disqualification (Removal) Act (Dec. 1919) gave women the right to hold practically every other public or professional position pertaining to civil life with the exception of membership of the House of Lords. Even this exception was subsequently removed: on March 2 1922 the Committee on Privileges of the House of Lords favourably passed upon a petition by Lady Rhondda holding that she and the 24 other peeresses in their own right were entitled to seats in the House of Lords.

As an immediate result of the Act women could be admitted to the degrees of any university, whatever the terms of its previous charter. The university of Oxford rose to the height of its opportunity; Cambridge, up to the close of 1921, still lagged behind. In the general election of Dec. 1918 women, who had qualified by residence and examination for degrees not yet conferred upon them, exercised the university franchise by reason of that qualification. The absurdity of such a position appealed to the more logical university. In Feb. 1920 Prof. Geldart introduced a statute into Congregation at Oxford, proposing to admit women to full membership of the university. Two amendments were moved on March 9, one to exclude women from university boards, the other from examinerships, but both were rejected by large majorities. On May 11 the statute was carried without alteration, and three subsidiary statutes, admitting women to all university offices, passed unopposed. Since Oct. 7 1920 the women students of Oxford have enjoyed the same advantages, and been subjected to the same university discipline, as the men. They even wear in slightly modified form the same academic dress at lectures and all university ceremonies. Moreover the gift was retrospective; every woman who had passed the examinations for the degree course and resided not less than 9 terms (three years) in Oxford as a member of a recognized Society of Women Students (such societies being the four women's colleges, or the Society of Oxford Home Students) became eligible for a degree, and on Oct. 14 the degree of B.A. was actually conferred upon a large number of qualified women, the principals of the various colleges and halls and the principal of the Oxford Home Students receiving the hon. degree of M.A. On March 11 1921 the hon. degree of D.C.L. was conferred on Queen Mary, on the occasion of a visit to Oxford in support of the appeal of the Oxford women's colleges for funds to meet the anticipated increase in the number of students anxious to matriculate at a university which offered them full privileges of membership. During the academic year 1920–1 the total number of degrees conferred upon women at Oxford was: B.A. 621; M.A. 345; B.Litt. 9; B.Sc. 3; B.C.L. 1; B.Mus. 2; D.Mus. 1; D.C.L. 1.

At Cambridge the position up to the summer of 1921 remained uncertain and, from the women's point of view, unsatisfactory. On Dec. 8 1920 a proposal to admit women to degrees was decisively rejected by the Senate, the figures being 712 for and 904 against. An alternative scheme to set up a separate university for women at Cambridge, conducting its own examinations and conferring its own degrees, met with no favour and was strongly opposed by the women concerned. When it came before the Senate (Feb. 12 1921) it was rejected by 146 votes to 50. A "compromise" scheme, giving membership of the university and full degrees and making women undergraduates eligible for professorships, lectureships, university boards and syndicates but not for the Senate, was again rejected on Oct. 20 when it was defeated by 908 votes to 694. An alternative scheme for conferring by diploma "titular" degrees on women, carrying with them no university membership, was passed by 1,012 votes to 370. This alternative, however, was unacceptable to the women.

Amongst the learned and academic distinctions won by women during the decade may be noted the presidency of the botanical section of the British Association held by Ethel Sargent (d. 1918) in 1913 and by E. R. Saunders in 1920. In Dec. 1920 Eugenie (Mrs. Arthur) Strong was appointed Rhind lecturer in archaeology and the first woman fellow of the Society of Antiquaries. In 1918 the Founder's Gold Medal of the Royal Geographical Society was bestowed upon Gertrude Margaret Lowthian Bell.

By Section 2 of the Sex Disqualification (Removal) Act women were permitted to become solicitors. Three years earlier (Jan. 1917) a proposal to admit women to the bar had been defeated at its annual general meeting by a large majority, though in Feb. 1917 a bill to permit them to qualify as solicitors obtained a second reading in the House of Lords. On Jan. 1 1920 Mrs. Gwyneth Marjory Thomson (Bebb), who died at the early age of 31, was admitted at Lincoln's Inn as the first woman student for the English bar. She had previously (1913) tested the legality of a woman practising as a solicitor by bringing (with others) a case against the Law Society. On May 7 1920 Miss Tata, a Parsi, was admitted, also at Lincoln's Inn, as a student preparing for the Indian bar. A few women presented themselves for the law examinations at the universities and passed with distinction, Mrs. Thomson obtaining a 1st class at Oxford, and Miss L. F. Nettlefold at Cambridge, and in June 1921 Miss K. Snell of Girton College was placed above No. 1 in Class I. of Part II. of the law tripos at Cambridge. In March 1921 five women passed the intermediate examination for the bar and on May 26 Olive Catherine Chapman passed the final examination.

Seven women (the Marchionesses of Crewe and of Londonderry, Mrs. Humphry Ward, Mrs. Lloyd George, Miss Elizabeth Haldane, Mrs. Sidney Webb and Miss Gertrude Tuckwell) were appointed justices of the peace on Jan. 1 1920. On Jan. 9 Mrs. Ada Summers, mayor of Stalybridge, took her seat as first woman chairman of the bench. In March of that year 24 women were appointed for the county of Lancaster, and in July a large number were appointed for the county of London; appointments were subsequently made throughout the United Kingdom.

On Aug. 6 1920 women jurors were for the first time empanelled, at Bristol. In Jan. 1921 women jurors were first summoned to the Central Criminal Court, London, and were also first called as "special jurors" in the Probate and Divorce Court. The first case which they had to try involved details of an unpleasant character, and some controversy subsequently arose as to the suitability of mixed juries in divorce and other cases. It was, however, generally held that the discretion left to the judge to make an order exempting women from service in cases of a certain kind was sufficient safeguard, and a bill, introduced into the House of Commons by Mr. G. Terrell on April 15 to amend the Sex Disqualification Act by providing that no women should be compelled to serve on a jury, failed to secure support, only 19 members being present when he introduced it.

Shortage of candidates for the medical profession during the World War encouraged a very large number of women students to present themselves. War conditions led to the admission of women students to several of the London general hospitals; before the war they were restricted to the Royal Free Hospital and the School of Medicine attached to it, or to the few hospitals for women, staffed by women. A notable advance was also made in placing the Endell Street (London) military hospital, opened Feb. 1915 by the R.A.M.C., under Dr. Louise Garrett Anderson and Dr. Flora Murray, and by the employment of other women surgeons and physicians under the R.A.M.C. in Malta, Salonika and elsewhere.

Progress in the Civil Service was rapid during the war, when women, as temporary civil servants, held many responsible posts, and were paid on a higher scale than had previously obtained. On May 19 1920 the House of Commons passed a resolution declaring that women employed in the service of the State should have equal opportunities and equal pay with men engaged on the same work. But the power to reserve to men certain departments of the service, given to the Treasury by Order in Council, was widely exercised, and the progress made fell short of the desires and expectations of the women affected (*see* WOMEN'S EMPLOYMENT). On Aug. 5 1921 a debate on the subject took place in the House of Commons on a resolution moved by a private member. A Government amendment to it was agreed to, whereby for a provisional period of three years special conditions were to obtain both as to method of selection and rates of pay, but subsequent conditions were to be the same for both sexes.

No barriers now exist excluding women from any profession, except the army and navy, and ministry of the Church of England or the Roman Catholic Church. In Feb. 1920 Convocation passed a resolution against giving permission, even to accredited women "to preach and pray in congregations composed of women and children," but in July the Lambeth Conference recommended the admission of women to the diaconate and a wider use of their ministry in non-liturgical services. Permission was, however, refused to Miss Maude Royden to preach in a London church at a special Good Friday service in March 1921. The General Assembly of the English Presbyterian Church resolved in May 1921, by 156 votes to 124, to admit women as elders and deacons.

In practically all other directions the field lies open to women. Their achievements during the war proved that they but needed opportunity. The remaining struggle was not for permission to work but for adequate remuneration. "Equal pay for equal work" became their rallying cry. It was inscribed upon the banners of an imposing procession, demanding equality in the Civil Service, which paraded London on April 28 1920; it formed the basis of the protest of women teachers to the Minister of Education (May 1920) and of their demonstration in Trafalgar Square (Nov. 1920) against the proportion (four-fifths) of male salaries allowed them under the Burnham scale. In the industrial world the women's claim to an equal bonus prompted the successful strike of tramway and omnibus workers in London in Aug. 1918. Not inappropriately the National Union of Women Suffrage Societies renamed itself the National Union of Societies for Equal Citizenship.

The problem was no longer political, or even social; it was economic. The removal of the few remaining disabilities of women, such as their inferior share in the guardianship and control of their children, depends in the last resort upon the securing for them, whether in marriage or out of it, of economic independence. Otherwise freedom to control those whom she cannot maintain, or the right to leave a husband when she is incapable of maintaining herself, are illusory rights of little value to a woman. When the last traces of the legal theory that husband and wife are one person, and that the woman, as such, must be under the tutelage or guardianship of parent or husband, have been obliterated, there will still remain need for legislation securing to a woman freedom to work outside her home, or, as an alternative, wages for work within it going beyond bed and board, as well as a fair share of joint earnings. Not till this is accomplished will the theory of equal citizenship have been translated into fact. (J. E. C.*)

(2) UNITED STATES.—The increase in interest in professional work for women in the United States, during the World War, was evidenced by the number of bureaux and associations for the exchange of information in this field. A book published in 1920 by the director of the Intercollegiate Vocational Guidance Association told the story of over 30 groups of professional occupations where women were already at work. An examination of the many branches under the main groups indicated that there was practically no profession women had not entered. The Bureau of Vocational Information published intensive studies of the leading professions, and the National Social Workers' Exchange was organized to place trained workers in professional positions throughout the country. During the World War increased opportunities came to women, both in the accustomed professions and also in new lines of endeavour. It is probably true, however, that most of the professional work, which was considered "new" to women, was "new" only in the sense that it was unknown to the general public. In the case of employment managers, personnel and welfare workers, for instance, women had been employed for some time, but the war increased the number and brought their work vividly before the public.

Industry.—Many of the women taking executive positions in industry had been forewomen and were promoted in the war emergency. In one investigation of 250 plants, 146 employed women executives other than forewomen. The more important positions included those of designers, office or factory managers, employment managers, welfare directors, nurses and occasionally doctors, matrons, lunchroom managers, production supervisors, department heads, statisticians and saleswomen on the road. Later there developed a tendency to employ college women in these positions, and by 1920 at least three universities and a half-dozen schools had offered special training courses. One school alone graduated over 200 women whose salaries ranged from $2,000 to $5,000 a year.

Medicine.—Perhaps the most important demand among the already recognized professions was for an increased number of nurses and doctors. In 1920 there were registered about 40,000 nurses in private practice and about 10,000 in public health work. It was in the latter field where every effort was being made to increase the number to 50,000. The number of women physicians at the same time was about 6,000, and practically all of the American medical schools were open to women, although not always on quite the same terms as for men. Women were not only practising physicians but they also held important positions in surgery, dentistry, laboratory research, and on the staffs of hospitals and medical schools. In addition to the "regular" physician it was estimated that there were about seven or eight thousand women practising osteopathy.

Law.—Since 1869, when the first woman was admitted to the bar in Illinois, the profession of law has claimed an increasing number of women. By 1921 every state in the Union except Delaware had admitted both sexes, and at least 1,600 women were practising in various branches of both civil and criminal law. Out of 129 law schools only 27 then refused admittance to woman students, but among those refusing were two of the leading schools, Harvard and Columbia. In many cases women who were graduate lawyers specialized in one phase of work such as corporation law, patent law, legal research or court work. Others did not enter the practice of law but engaged in work where their legal training became valuable background. Among the important Government positions held by women lawyers in 1921 were those of the U. S. probate attorney, judge of the juvenile court in the District of Columbia, city magistrate in New York City, deputy collector of customs, and county attorneys, treasurers, clerks, probate judges and justices of the peace in various states. Two states have had women assistant attorneys-general, and probably the most important position held by a legally trained woman was that of assistant attorney-general of the United States.

Education.—One of the few professions given over very largely to women was that of teaching. Women almost completely filled the ranks in the elementary public schools, and very nearly so in the higher grades. Men predominated in the colleges and universities, but women held many important positions as faculty members and occasionally as presidents of women's colleges. Many of the higher educational institutions employed women deans to supervise and advise the women students. Salaries for these positions were seldom above $3,000 or $4,000, but occasionally the dean of women held the rank of full professor and received a corresponding salary. Many smaller cities employed women as superintendents of schools, but in 1921 only one or two of the larger cities had engaged women in this position. An increasing number of women were employed in private schools either as teachers or principals, and often private schools were owned and managed by women. Since 1900 particular problems in education have been emphasized and women specialists developed in such fields as manual training, recreation, kindergarten, physical education, vocational training, and the education of the blind, feeble-minded or subnormal.

Immediately following the World War an acute shortage of teachers occurred, due to the large numbers drawn off into better-paid positions. This exodus amounted almost to an "invisible strike" for higher wages and became so serious that schools in many places either closed entirely or were open for only half-day sessions. A movement was started to establish a minimum salary of $1,500 a year in order again to attract women to the profession, but the wave of economy which spread over the legislative bodies in 1921 greatly impeded the efforts to raise the standard of teaching and to secure better educational facilities.

Social Work.—Since 1900 a remarkable increase occurred in the numbers of women engaged in various forms of social service. Women have of course been the traditional bearers of charity and have long been connected with correctional work. But this was largely in the form of volunteer service. With the greater development of paid service, and the desire to treat causes rather than effects, there developed a wide field of work and a large number of workers. Social service was classified by the National Social Workers' Exchange as follows: (1) Social case work, dealing with individuals, as church visiting, family case work, medical social service, probation, protective and prison work, public health nursing and visiting, school visiting, and employment exchange work, both public and private (2) Social group work, including community-centre work, Americanization boys' and girls' club work, playground and recreation work. (3) Social reform work dealing with people as a mass—as housing reform legislation, anti-tuberculosis work, and the promotion of child hygiene. (4) Social research, comprising special investigations, research and statistical work including surveys and exhibits. No fewer than 14 schools for the training of social workers had been established by 1921 and the demand for women with proper training usually exceeded the supply.

Civil Service.—Extensive opportunities for women are to be found in civil service positions offered by city, state, and Federal governments. In 1920 about 200 cities, 11 states and the Federal Government had adopted the competitive civil service plan. The number of women employed in the civil service throughout the country could not be accurately ascertained but a conservative estimate of those in the Federal service in 1920 placed the number at about 50,000 in the District of Columbia alone. During the first half of the year 1919, examinations were held for 260 different types of service with positions varying from that of charwoman at $240 a year to a Federal Trade Commissioner at $10,000.

The plan of the classified civil service aims, on the whole, to give equal opportunity to both sexes. But in practice women are often discriminated against by the custom of excluding them from certain types of service and also by permitting the heads of departments to determine the sex qualifications both for examinations and for appointments. In the Federal Government service, where women were admitted by statute in 1870 at the discretion of the head of the department, the custom of giving preference to men had been so powerful that in the civil service examinations held between Jan. 1 and July 1 1919 women were excluded from over 64% of the positions in scientific and professional services, from 86% of the positions in the manufacturing and mechanical services and from 75% in the medical services. In the work of collecting information from original sources only 4 out of 16 different kinds of positions were open to women. Even the Federal Bureau of Efficiency and the Federal Board for Vocational Education closed its examinations to women.

This policy of discrimination was deeply affected by the shortage of labour during the World War, and the situation was partly remedied when the Civil Service Commission, after an investigation by the women's bureau of the Department of Labor, opened all examinations to both sexes, but with the reservation that heads of departments may specify which sex was desired. This latter provision will need to be modified before equal opportunity is completely secured. There also exists in the Federal service serious discrimination against women in the matter of salary levels and in the classification of grades. During the first two months of 1919, for instance, over 86% of all women appointed received salaries ranging between $900 and $1,300 a year, while only 36% of the men received these salaries. The number of women receiving probational and temporary appointments, in this same period, was about twice as great as the number of men in the same classes. But efforts to remedy this situation are increasingly successful.

Positions most commonly open to women include those of stenographer, secretary, librarian, statistician, editorial and clerical worker. Many departments, however, require women with expert technical training such as biologists, bacteriologists, chemists, dietitians, linguists, draftsmen, doctors, nurses, directors for playgrounds and recreation centres, and specialists in social welfare such as child hygienists and factory inspectors. Public institutions also offer opportunities for women in such positions as matrons, supervisors, inspectors and in the more technical positions as physicians or psychologists. Tenure of office based upon merit, often with a pension upon retirement, is probably one of the most alluring features in civil service work.

General.—The entrance of women into many other professions was given a special impetus during the war, including journalism, advertising, commercial art and banking, where women were employed both as clerks and as officers and directors. Architecture, interior decoration, landscape gardening and motion-picture work attracted an increasing number of women. In motion-pictures women were not only actresses but also title editors, research workers, readers and occasionally directors or even producers. The exceptionally large salaries of $25,000 and $50,000 were occasionally reported, and a rare motion-picture director or a play broker was said to earn $100,000 a year. It is apparent that women have entered a very large number of professions exclusively held by men in earlier years, and their success indicates that they are certain to remain and to carry important responsibilities. (I. O. A.)

WOMEN, LEGAL STATUS OF (*see* 28.784*).—(1) UNITED KINGDOM.—The position of women in England was almost revolutionized between 1910 and 1921. Very little actual change in the law took place between 1882 and 1918, but beneath the surface inevitable changes were impending, and the World War brought about the outward change as probably nothing else could have done. The parliamentary suffrage (*see* WOMAN SUFFRAGE) was granted in the early summer of 1918 to all women over 30 years of age whether single, married or widows;[1] and in Dec. 1919 they were declared eligible for any office.

It may be taken as a general proposition that from the beginning of the year 1920 onwards there has been no difference in the legal position of men and women on account of their sex throughout the United Kingdom, and since that time no woman has been under any civil disqualification by reason of sex or marriage. As far as property was concerned, even under the old law, the non-married woman, whether spinster or widow, held her property on the same terms as a man. She could buy and sell, go to law and make her will just as a man could. The married woman's position before the year 1882 was far different. It is well stated by one who, though born in the United States, became one of England's greatest lawyers, thus: "A married woman is absolutely incompetent to enter into contracts, and has in the contemplation of law no separate existence. She cannot make a valid purchase on her own account even for necessaries, and when credit is given to her there is no remedy but an appeal to her honor" (*Benjamin on Sales*, 3rd ed., p. 32). All this has completely disappeared. The Married Woman's Property Act 1882 was a great step in advance, and the last remnant of the medieval doctrine that for every purpose husband and wife were one person (and that person the husband) disappeared in 1920 when they were made capable of stealing from one another except when living together. A married woman is now as capable of dealing with her own property as a man is.

Married women (and of course all spinsters and widows) can now make their wills and dispose of their property as they wish. In England neither the husband nor the children have a right to any part of it except in the absence of a will. In Scotland the children have a legal share, on which they can insist on their parent's death. A married woman is not obliged to ask her husband's leave to make a will, nor need she make him executor or leave him any part of her property, unless she wishes to do so. Among wealthy people the married woman's position as to property is often controlled by her marriage settlement. The provisions are almost invariably the same, viz. that the capital of the property is in the hands of trustees and the income goes to the wife, who cannot anticipate it. On the death of the wife the husband sometimes has the income for his life. If there are children the capital is divided among them, generally in equal shares. If there are no children or other descendants of the wife the property goes back to the wife's relations, unless she disposes of it by will as she can generally do.

It is, however, an irony that even in 1921, in respect of her motherhood and the custody of her own children, the woman was still inferior to man (*see* 14.514), and also as to inheritance she was still not in such a good position as her husband or brother. In case she does not make a will all her property except her land goes to her husband, whereas if he dies intestate she only gets a third of his property, or half if he has no children (*see* 14.568 and

---

[1] By the Representation of the People Act (1918) all the old franchises were swept away. There are now three qualifications for women as parliamentary electors under the Act: residential, university, and as the wife of a local government elector. In her own right a woman may qualify by residence in the electoral area and may in addition have one or more university votes. As the wife of a local government elector she may also have a parliamentary vote, but she may not vote more than once in the same election nor for more than one ordinary constituency in a general election. In addition she has one university vote at a general election. To qualify as a local government elector she must have (*a*) attained the age of 21, be resident in the area on the last day of the qualifying period (Jan. 15 or July 15), have occupied some land or premises in the area for the whole of the qualifying period, or in the alternative (*b*) must have attained the age of 30 and be the wife of a man who is entitled to be registered as a local government elector in respect of the premises in which they both reside. To qualify as a parliamentary elector she must have attained the age of 30 and must be entitled to be registered as a local government elector in respect of the occupation in the electoral area of land or premises of the yearly value of not less than £5, or of a dwelling house, however small the value, or be the wife of a husband entitled to be so registered. This means that the husband must own land or premises in the area of the yearly value of not less than £5. In all the above cases the women must not be under any legal incapacity. A peeress in her own right can be an elector and also a peeress by marriage. There are certain offices, chiefly in Scotland, which if conferred on a woman would incapacitate her as a voter. She must not be a lunatic, an alien or a convict. The wife of a person serving in military or naval forces of the Crown, who would if he were not so serving be entitled to be registered as an elector, is not disqualified. The wife of a "conscientious objector" is not disqualified.

In the case of a university vote the woman elector must be 30 years of age, and fulfil the same local conditions as a man elector, or have passed the final examination and kept the period of residence necessary to qualify a man at the time when the university did not grant degrees to women.

14.714). A very elaborate bill was in 1921 before Parliament intended to give her an equal share with her brothers in her parents' landed property.

The Sex Disqualification (Removal) Act, 1919, provides that no person (whether man or woman) shall be disqualified by sex or marriage from the exercise of any public function, or from being appointed to or holding any civil or judicial office or post or from entering or assuming or carrying on any civil profession or vocation or for admission to any incorporated society (whether incorporated by Royal Charter or otherwise), and a person shall not be exempted by sex or marriage from liability to serve as a juror. The word "person" in English law includes woman as well as man. The Act further provides (*a*) that His Majesty may by order in Council authorize the admission of women to the Civil Service, and reserve to men any branch of, or posts in, the Civil Service in H.M. possessions overseas or in any foreign country; (*b*) that any judge or other person before whom a case is heard may in his discretion on application (in both civil and criminal cases) by either party or at his own instance make an order that the jury be composed of men or women only, or may on her application exempt a woman from service on a jury by reason of the nature of the evidence or issues to be tried. Rules of Court have been made as to summoning jurors, exempting women who are for medical reasons unfit to attend and as to procedure. Section 2 provides for the admission of women as solicitors. Section 3 enables any university to admit women to membership or any degree notwithstanding any statute or charter of such university. The Act overrides all previous statutes, orders in council, royal charters or other provisions inconsistent with it, and applies to the whole United Kingdom.[1]

It will be observed that the qualification to hold office only applies to civil life. Military and ecclesiastical offices are not open to women. On the passing of the Act Viscountess Astor was almost immediately elected to the House of Commons and took her seat as a member, and women were appointed justices of the peace and began to serve on juries. The contrast between the position of women in 1921 and 50 years earlier is certainly very striking. The unmarried woman, both spinster and widow, was equally disqualified formerly from public functions and offices, but she was in the same legal position as a man for the purposes of contract and wrong-doing. In criminal law the married woman as well as the single one has now the same position as a man with some trifling exceptions. The recent Larceny Act, which codifies the law, finally makes it possible for the wife as well as the husband to steal from one another when they are living apart, or deserting, or intending to desert the other. Up to the last-mentioned date the medieval conception that the husband and wife were one person made it impossible for them to steal from each other, just as it formerly made it impossible for one of them to give or convey property to the other. All this is now abolished and, with the exceptions presently stated, a woman, even when married, must be treated in law as a man. This is not however the case with military or ecclesiastical law. A woman is not liable to serve in the forces of the Crown, and she cannot in the Church of England or the Church of Rome be a priest or hold such ecclesiastical offices as are held by men. She is also subject to her husband in ecclesiastical law, and they are regarded for many purposes as one person. She is also by the law of marriage regarded as under the authority of her husband. Her duty is obedience in all things not sinful. The husband has a right to her custody and control. She must live in the house he appoints and sleep with him if he wishes it. She has no remedy except to leave him, and if she does so for such a reason he is not bound to support her. He cannot however legally prevent her from leaving him (*Jackson v. Jackson 1891*). She cannot get damages from him for imprisonment (*Tinkley v. Tinkley 1908*).

The wife can obtain a maintenance order from a magistrate if she separates from her husband on the ground of his assault on her, or his desertion. Orders made abroad can now be enforced in England, and, if made in England, can be enforced against the husband abroad. Maintenance for the children can also be obtained up to 10s. per child (Married Woman Maintenance Act 1920).

In England until the Act of 1874 (36 and 37 Vict. c. 12) the father was the sole guardian of the children of any marriage and was entitled to the sole custody and control of them. The mother had no legal rights whatever. By an Act of Charles II. (1660) the father was given the sole right to appoint a guardian or guardians of his children to act after the father's death so long as they are under twenty-one. By the Guardianship of Infants Act (1886) the mother, if surviving, is the guardian of each child either alone, when no guardian has been appointed by the father, or jointly with the guardian appointed by him. The mother may also appoint a guardian to act after her own and the father's death. Subject to the confirmation by the Court she may also appoint a guardian to act with the guardians appointed by the father. By Section 5 the Court may make such order as it thinks fit regarding the custody of the child and the right of access thereto by either parent "having regard (*a*) to the welfare of the child, (*b*) the conduct of the parents, and (*c*) *the wishes as well of the father as of the mother*." This statute however has been interpreted by the judges to mean that where the father's wishes and the mother's were opposed the father's wishes must prevail. By the Guardianship of Infants bill (1921) the above Act would be wholly repealed. The father and mother in future and for all purposes would be joint guardians, and have joint custody, and have "equal authority, rights and responsibility with regard to every legitimate child, any former rule of law or equity to the contrary notwithstanding." The father and mother would be jointly and severally liable for the maintenance and education of the child according to his or her means on the application of either the father or mother or any other person acting as next friend. Their executors would also be liable.

There is an old saying that lawyers are divided into two classes: those who think man is made for the law and those who think the law was made for man. It is the first class that makes the law unpopular; but it should be remembered that when husband and wife quarrel about their children the task of the judge is a very difficult one. The most difficult case is where they differ in religion. It has been laid down (*Agar-Ellis* case 1878) that the child must be brought up in the religion of the father. In this case he was a Roman Catholic and had not been guilty of misbehaviour. It was decided that the children must not be brought up by their mother on the ground that she might make them Protestants; if the father had been a Protestant and the mother a Roman Catholic she would have been deprived of her children on the same grounds. It was further laid down that no promise by the father before marriage as to the education of his children can be enforced after marriage, as he has a right to alter his mind. The last named decision might well be reversed by statute. In the case of property the husband's agreement before marriage can be enforced, and it seems unjust not to enforce his agreement as to the children. But in cases where the father and mother are of different religions and no promise has been given, it makes the judge's task a difficult one. Hard cases make bad law. and the difficulty lies, not with the judges, but in the real tragedy of these disagreements. (R. TH.)

(2) UNITED STATES.—Although the legal emancipation of women was far advanced in the United States at the end of the 19th century, three things were yet incomplete: (1) full recognition and securing of the individual interests of women in the domestic relations, which were often left unsecured legally because of survival of doctrines or institutions coming down from a state of society in which all women were dependents, and were normally under a sort of guardianship; (2) full logical development of the legal capacity of married women and doing away with the remnants of their common-law disabilities, already long abrogated for the most part in the United States, but surviving here and there in curious local anomalies; (3) legal taking account of the facts of women's physical constitution in their relation to wages and hours and conditions of labour in industry, and securing of the social interest in the individual life of women by adequately protecting them in these connexions.

With the progressive breaking down of the legal conception of the household as an entity ruled from within by a head, and as an agency of social control, it becomes necessary to give legal recognition and protection to individual interests of women in the domestic relations, which at common law were supposed to be secured through the internal economy of the household, or were left unsecured in view of a paramount social interest in the household as a social institution. Summarily, these may be put as *parental* interests—interests of women in the relation of parent and child, and *marital* interests—interests of women in the relation of husband and wife.

Parent and Child.—At common law the father was entitled to the custody of his minor child and the mother had a right to custody only after the father's death. In form this still stands in the books as law, but in substance there has been a complete change within a generation. Equity long ago refused to give effect to the father's common-law right of custody as against the interest of the child, and by taking the equitable doctrine of regard for the interest of the child over into the law, the courts have been able to put father and mother upon an equality for practical purposes in almost all jurisdictions. Yet the common-law doctrine remains theoretically in force in the absence of legislation, and legislation halts. One decision as late as 1905 holds that as between father and mother, the former has a legal right to control the religious training of the children. (*Hernandez v. Thomas, 50 Florida Reports, 522, 536.*)

Husband and Wife.—Marital interests of women include claims against the world at large growing out of the relation of husband and wife, and claims of wives against husbands because of that relation. As interests of personality a wife has claims to the society of her husband, quite apart from any economic advantage; to the affection of her husband, analogous to the legally recognized claim of the husband to the society and affection of the wife; and to the chastity and constancy of the husband as involving her self-respect and honour. These interests, however, are not yet recognized to their full extent and are not fully secured even in legal theory. The first and second are now protected by an action for alienating the husband's affections, which has come to be allowed by the overwhelming weight of American authority. (*Turner v. Heavrin, 182 Kentucky Reports, 65, 1918*). The third is at most but partially recognized and indirectly secured; but it should be said that the obvious inutility of the husband's means of redress, which should be applied by analogy to make the law logically complete, has had much to do with the apparent backwardness of the law on this subject. As an interest of substance the wife may claim to be secured in the marriage relation as an economically advantageous relation, providing her with support and shelter. Where the husband is enticed or induced to abandon his wife or to divert earnings which should be devoted to her support, the courts are coming to recognize this interest directly. (The wife's action was allowed in *Flandermeyer v. Cooper, 85 Ohio State Reports, 327, 1912*: it was denied in *Brown v. Kistleman, 177 Indiana Reports, 692, 1912*.) On the other hand in case of physical injury to, or abduction of, the husband, the wife is still usually denied an action, although the husband may recover in the converse case for "loss of service." No doubt there are practical difficulties here, arising in part from our mode of trial and of assessing damages. Yet the present state of the law, shaped by obsolete conceptions of the position of the wife in the household, is so out of accord with the present-day position of married women that legislative overhauling in the near future is not unlikely. Regarding the claims of the wife against the husband, modern law everywhere has agreed to leave the interest of husband and wife respectively in the society and affection of the other without effective legal sanction as between the two. The claim of the wife to support was recognized fully and secured adequately at common law. Recent legislation setting up domestic relations courts and providing for criminal prosecution in case of non-support has only put more effective administrative machinery behind existing legal duties of the husband. The most serious inequalities in this connexion were in the procedural difficulties encountered in enforcing the wife's legal rights. Domestic relations courts, which have had a considerable development in the U.S. in the last decade, are adapted especially to removing these obstacles (see Smith, *Justice and the Poor*, chap. 11.). It should be noted also that modern legislation, although taking away from the husband all control over the wife's property and earnings and committing it solely to the wife, has left untouched the common-law duty of the husband to support the wife even if she has property and he has none. Some courts go so far as to allow a wife possessed of means who has supported herself out of her separate estate to sue the husband and obtain restitution of the amount thus contributed. (*De Brauwere v. De Brauwere, 203 New York Reports, 460, 1911.*) A few western states, however, now impose upon a wife of means and ability a duty of supporting an indigent and infirm husband, and allow an action by the husband to enforce this duty. (*Hagert v. Hagert, 22 North Dakota Reports, 290, 1911.*)

---

[1] Women who wish to be solicitors should apply to the Incorporated Law Society, Chancery Lane, W. C. 2, or barristers to the Benches of the Temple, E. C., or Gray's Inn or Lincoln's Inn, W. C. Nurses and midwives are under the Ministry of Health. There are penalties for using either title without registration.

Disabilities of Married Women.—Unmarried women of sound mind and lawful age were under no common-law disabilities. On the other hand married women were without power to determine their own national character or legal domicile, following their husbands in these respects as a matter of law; were subject to serious disabilities with respect to ownership, use and enjoyment of property; were restricted in their power to sue in the courts; could not convey property; and had no power to contract. Some of these disabilities were rested on a fiction of the legal unity of husband and wife, derived from the position of the husband as guardian of the dependent members of the household in the old Germanic polity and reinforced by certain texts of Scripture, whose authority was decisive in the Middle Ages. Legislation began to abrogate these disabilities early in the 19th century. But it was often far from comprehensive in its scope, and when sweeping provisions were enacted they were often interpreted narrowly because of the doctrine requiring strict construction of statutes in derogation of the common law. There has been a gradual but steady progress in the direction of removing all of these disabilities partly by legislation and partly by judicial decision, and many anomalies which resulted from halfway legislative measures or strict judicial interpretation were in the decade 1910–20 shaken, if not overthrown. With respect to separate domicile of married women and actions by wives against husbands, the social interest in the security of marriage and the family as social institutions of paramount importance has necessarily given the courts pause, since the doctrine that the wife's domicile depended on that of the husband, and that the one might not sue the other, seemed but corollaries of a legal recognition of the family as an entity. Yet when that entity is *de facto* dissolved, these doctrines amount to serious disabilities imposed upon one member. Accordingly in one way or another American courts now recognized the separate domicile of the wife substantially to the full extent of her individual interest in free self-assertion. (*Williamson v. Osenton, 232 U.S. Reports, 619, 1914.*) So also with respect to actions by the wife against the husband. The older Married Women's Acts which in form merely removed disabilities as to property and contract, were long construed as not allowing such actions since they did not do so expressly, and a policy against aggravation of domestic troubles by dragging them into court was taken to be in the way. This sacrifice of the individual interests of the wife to the supposed exigencies of a social interest has now definitely given way, and conservative courts are allowing such actions even under statutes in terms dealing with property rights only. (*Brown v. Brown, 88 Connecticut Reports, 42, 1914.*) The more recent type of statute, providing that a married woman shall have the same legal existence and personality after marriage as before marriage, necessarily permits such litigation. (*Fiedler v. Fiedler, 42 Oklahoma Reports, 124, 1914.*) As to capacity to own, acquire, use and enjoy property, little remains of the old law, and there are but few jurisdictions where legislation might still accomplish anything. In one respect, however, improvement by judicial decision is still going forward. A number of states, by derivation directly or indirectly from Spanish law, have the institution of "community property," in which with respect to certain property, and especially property acquired after marriage, husband and wife are treated legally as a sort of property-owning entity. The older view was that the husband was the administering agent of this collectivity during their joint lives, and hence could dispose of it, alter its form and charge it with his personal debts; and that it could even be taken in execution for his wrongful acts. Recent decisions in some of these jurisdictions, recognizing the individual interest of the wife, hold that the community property is not liable for acts done by the husband outside of the reasonable scope of his authority as agent of the community. (*Schramm v. Steele, 97 Washington Reports, 309, 1917.*) Yet even there a claim for an injury to the wife being an acquisition after marriage and community property, she is not allowed to sue therefore if her husband refuses to join. (*Hynes v. Colman Dock Co., 108 Washington Reports, 642, 1919.*) As to contractual capacity, little remains to be done anywhere in order to give married women full beneficial powers of contracting in their own interest. Yet in more than one jurisdiction privileges which compensated for the older disabilities still remain in force in whole or in part and enable married women to escape from contracts for which as persons of full capacity they ought to be held. This is especially true of contracts of suretyship, by which married women are very generally incapable of binding their separate property.

Protection of Women in Industry.—While American courts have been reluctant to give over, or to construe legislation as abrogating, common-law privileges or disabilities which protected married women when in a condition of legal dependence, they have also been reluctant to uphold legislation restricting freedom of contract on the part of women in industry with respect to hours and conditions of labour and minimum wage. When such statutes were first enacted, they were held unconstitutional as being arbitrary and unreasonable interferences with liberty of contract by a court which had had no hesitation in keeping alive common-law disabilities, that had long ceased to secure any individual or social interest. That decision has been overruled (*Ritchie v. Wayman, 244 Illinois Reports, 509, 1910*), and it seems to be settled that legislation may take account of the facts of women's physical make-up and secure the social interest in a healthy womanhood by regulating the hours of labour of adult females. (*Muller v. Oregon, 208 U.S. Reports, 412, 1908; Bunting v. Oregon, 243 U.S. Reports 416, 1917.*) But it is still a matter of controversy whether this may be carried to the extent of fixing a minimum wage for women employees. (*Stettler v. O'Hara, 243 U.S. Reports, 629, 1917.*) Curiously enough, the political and legal emancipation of women is urged as a reason against such legislation, as if the removal of political and legal disabilities had any relation to, or effect upon, the physical handicaps upon women in industry which are the occasion of these statutes.

Women on Juries.—In 1917 California provided for the drawing of women upon juries. (*Laws of 1917, p. 1283.*) Since the adoption of the Nineteenth Amendment of the Federal Constitution providing for women suffrage, 1920, it has been assumed that women are to sit upon juries everywhere. But in some jurisdictions, out of caution, it is felt that the courts should await express legislation, and in others courts have felt compelled to wait until court-houses and jury-rooms could be adjusted to the novel situation presented by juries of men and women. The conditions under which juries are kept while deliberating upon verdicts and the accommodations for jurors in large cities, where many juries are sitting simultaneously for a great part of the year, are not adapted to the woman juror; and in many country court-houses things are even worse. If no other good results from service of women upon juries, the inevitable improvement of the physical conditions surrounding jury service will be a gain. On the other hand, the expense involved in this improvement and in provision for the custody of juries made up of men and women in important cases, where juries must be guarded closely from outside contact, leads many jurisdictions to hesitate.

(R. Po.*)

WOMEN POLICE.—In Sept. 1914 two distinct bodies of women police were formed in England, with the object of maintaining order amongst girls and young women in the new and exciting conditions brought about by the formation of military camps and the movement of troops in training (*see* WOMEN'S WAR WORK).

The Women Patrols were organized by a special committee of the N.U.W.W., with Mrs. Carden as hon. sec. and chief organizer; and the Women's Police Volunteers were formed by Miss Nina Boyle and other members of the "militant" Women's Freedom League, and within a few weeks were reorganized by Margaret Damer Dawson (d. May 18 1920) as the Women Police Service. The latter was a paid force, dressed in a uniform closely resembling that of the regular male force; the former was mainly voluntary and wore no distinguishing mark except an armlet. The Women Patrols were, however, from the first recognized by the Chief Commissioner of the Metropolitan Police (Sir Edward Henry), who signed the passes authorizing them to patrol streets and public places, and by the Home Secretary (Mr. McKenna), who circularized the chief constables of borough and county police throughout the United Kingdom, inviting them to do the like in their own districts. The Women Police Service received no direct official recognition; but in 1916 they were requested by Sir Edward Henry to supply policewomen for the munition factories throughout the country. In Jan. 1917 the Women Police Service received a grant from the Ministry of Munitions for the expenses involved, and in the same year the Women Patrols received a subsidy of £400 from the Home Office, reduced the next year to £300. With these exceptions, both forces, which originated in private effort, were for long supported entirely by funds privately collected. They conducted their own training, the Women Police Service entirely at their London centre and the Women Patrols not only in London but also at the three schools which they established in Bristol, Liverpool and Glasgow. These combined in the autumn of 1918 to form the Federated Schools for Policewomen and Patrols and received a grant of £1,000 from the Carnegie U.K. Trust, followed by £250 in 1919–20.

In Oct. 1918 Gen. Sir Nevil Macready, who had become Chief Commissioner of Metropolitan Police when Sir Edward Henry resigned in consequence of the police strike in Aug. of that year, decided to form a force of 100 women police for London, to be drawn from the ranks of the Women Patrols. The force, afterwards known as the Women's Patrol of the Metropolitan Police Force, was organized and placed under Mrs. F. Stanley as superintendent, with one assistant superintendent and 10 sergeants, and its status and duties were defined by the Police Order of Dec. 23 1918. The women were not sworn in as constables and were not given the power of arrest. Similar limitations attached to most of the individual policewomen employed by the chief constables of boroughs or counties throughout the United Kingdom. These, in Sept. 1920, numbered 126 for England and Wales, of whom only 33 were appointed with the same status as men, and 14 for Scotland, none of whom were sworn in as constables. They were for the most part women trained by one or other of the two voluntary organizations. In Dec. 1920 certain members of the Women Police Service were engaged by the military authorities in Ireland to assist in searching women suspected of complicity in conspiracy.

The Committee on the Police Service appointed in March 1919 under the chairmanship of Lord Desborough did not deal with policewomen, and on the request of a deputation, which attended at the Home Office Aug. 8 1919, a Home Office departmental committee was appointed in Feb. 1920 to inquire into "the nature and limits of the assistance which can be given by women in the carrying out of police duties and as to what ought to be the status, pay and conditions of service of women employed on such duties." The committee, which included two women, Viscountess Astor and Dame Helen Gwynne-Vaughan, reported July 24 that "there is not only scope but urgent need for the employment of policewomen." They enumerate as "appropriate" duties: "investigations in cases of assault on women and children; investigations under the Children Act 1908, the Immoral Traffic Acts 1902–1912, and similar statutes; attendance at court when cases of female or juvenile offenders are being dealt with; inspection of common lodging-houses (where this falls on the police); supervision of parks and open spaces; visiting of licensed premises, cinemas, registry offices, etc.; prevention of offences by prostitutes; and, generally speaking, any work in connection with offences committed by and against women and children." They recommended: (1) that all policewomen should be sworn in, given full powers of arrest and ranked with the male police, forming an integral part of the police force and being trained and appointed by the chief constables; (2) that their pay should be standardized and approximated to that of the men (60s. minimum as compared with the men's 70s.), and that their allowances should be the same; (3) that their hours should be seven daily; (4) that marriage should be no bar to service; (5) that pensions should be granted on a scale slightly lower than for men, but that gratuities for dependent children should be the same for both sexes.

Up to Feb. 1921 this report had not been translated into action except as regards the pay and allowances to Metropolitan policewomen, which were standardized from Jan. 1 1921. But on Feb. 28 a deputation from the Federated Schools was assured by the Home Secretary that he would advise chief constables throughout the country that, where policewomen were employed, their employment should be regulated by the terms of the departmental committee's report. He added that it was undesirable that the work should any longer be carried on under voluntary organizations. Under Section 10 of the Police Act 1919 the wearing of police uniform by members of unofficial bodies is an actionable offence, and in March 1921 thirteen summonses were taken out against five executive members of the Women Police Service, which resulted on May 4 in fines of 10s. each and £10 10s. costs against the commandant. The name of the service was subsequently changed to the Women's Auxiliary Service, and changes were made in the uniform differentiating it from that of the official policewomen. Its future function was defined as mainly that of training, in London and in Edinburgh.

See *Report of the Committee on the Employment of Women on Police Duties* (1920, Cmd. 887) and its *Minutes of Evidence* (1921, Cmd. 1,133). See also the annual reports of the Bristol, Liverpool and Scottish Training Schools for Policewomen and Patrols, and the annual reports of H. M. Inspector of Constabulary for England and Wales (1917 *et seq.*). (J. E. C.*)

UNITED STATES.—About 300 cities in the United States employed policewomen in 1921, either as single officers of the law or in connexion with special women's bureaus. In many cases positions were secured through civil-service examinations, and promotions were made on the same basis as for men. Probably the largest number of policewomen was found in the cities of Chicago and New York, where the women's bureaus each employed about 30 women, usually in the capacity of police and patrol officers. Their duties were varied but related largely to the welfare of women and children. In Chicago one woman was assigned to the Morals Court, where she assisted the woman bailiff and the probation officers. In New York the women's bureau had attached to its staff a number of men welfare workers. These were usually former policemen who for some reason became incapacitated for regular work and who were assigned to assist in caring for needy cases, particularly among widows and children of former policemen. One city in 1921 announced the appointment of a coloured woman as police officer.

In some cases this wide field for social service attracted high-class women; their duties included probation work, institutional commitments, supervision of dance-halls and places of amusement, juvenile court work and at times physical and psychopathic examinations. This work frequently merged into expert detective work and required a woman to be on duty almost any time of the day or night. The minimum salary seldom fell below $1,000, while the highest was not often above $2,000 a year, except by special legislation. Policewomen were eligible for the retirement pension, which was usually about 50% of their salary. (I. O. A.)

WOMEN'S EMPLOYMENT.—UNITED KINGDOM.—Women have been employed outside their homes in the industries of Great Britain from at least the days of Edward II., when they appear to have washed ore in the Derbyshire lead mines for 1d. a day. During the following six centuries they found their way into one trade after another, until in 1914, at the outbreak of the World War, in spite of their having been in the 19th century almost driven out from their once considerable occupations of agriculture and coal-mining, the total number of women in commerce and industry in the United Kingdom was 3½ million, while another 2½ million were earning wages as hospital nurses, domestic servants, dress-makers in small workshops and outworkers of similar kinds.

The increase that took place during the war was only a million, and yet it probably attracted more discussion than the whole of the steady industrial development which had made the sudden extension possible. This was due partly to deliberate publicity designed to attract women into the factories, partly to the interesting nature of a small part of the work which they undertook;

but it also arose from public ignorance of the share that women were already taking in industry before the war. There was no great industrial group which did not at that time already employ thousands of women; in the building trades there were 7,000, and in mines and quarries nearly the same number. The metal trades held 170,000 women; there were even some hundreds in the Admiralty dockyards. The great exceptions were the shipyards, underground work in the mines, iron and steel foundries and rolling-mills, various branches of engineering and whisky distilling. Other important services, like the railways, used them only for clerical work and cleaning, except of course in posts which could only admit of women, such as those of attendants in women's cloakrooms. Others reserved certain processes for men and gave the rest to women: others were women's trades: others again used men and women interchangeably.

The demarcation that existed between men's and women's work was as a rule definite and well recognized in the trades concerned. The very heaviest types of work were done by men, and so in most cases was work that required any high degree of skill. Such work, moreover, was almost certain to be the subject of trade-union restrictions which effectively prevented employers from using women on it. But these criteria, except at the ends of the scale, were not absolute. Women in many occupations—for instance making chains or gramophone records—were accustomed to handle very heavy tools or lift very heavy weights. Many would not trouble to acquire skill, or were denied the opportunity; but the bad organization of women and their low rates of pay tended to conceal the fact that they were often employed on jobs which a man would have considered at least as semi-skilled, while a few women up and down the country were turning out work which required a considerable technical endowment. The Ministry of Munitions, to take an extreme instance, found optical lenses being ground by women in London which they considered equal to the finest German lenses, and this had been going on for a dozen years. Very few women had such an opening, but all along the middle line, where the work was neither too heavy nor took too long to learn, there were trades and sections of trades where the spheres of the two sexes overlapped, so that on certain parts of the work they were either used interchangeably or one or the other according to district custom.

The best known examples of this are probably the cotton, woollen and worsted weavers, and the machinists in the Birmingham brassware trade, clerks and shop-assistants. But in all such border-lands, as has been said, the tendency before the war was for the low-paid and restricted woman to replace the more mobile and unrestricted man. In most of these cases one type of labour or the other—by no means always that actually used—was probably more suited to the work and economically preferable; but even where employers were sensible of this, they found local customs and prejudices too strong to alter, and the problem was little thought about and never squarely faced.

During the World War.—British industry, therefore, when the war came, was not compelled to start afresh with totally untrained women workers. Less than a tenth of the 4,750,000 employed in Nov. 1918 in agricultural, commercial and industrial occupations, had been altogether ignorant when they entered on war work of at least the routine and discipline of an industrial life, and the majority had really useful experience. It is after all more difficult to learn to handle a power loom or a power-driven sewing machine than it is to change from one of these to a semi-automatic lathe. Employers stated that of the 3,000,000 women employed in industry alone 700,500—a number nearly equal to that of the new entrants into the same occupations—were directly replacing men. This did not mean however that they were necessarily engaged on work that before 1914 had always been done by men. In many instances the work itself was new. Gas-masks, depth-charges and anti-aircraft devices, for example, had not been made in the same way, if at all, before 1914. Sometimes the change made was only nominal, as when a shop full of girls who had been machining bicycle parts, was turned over to the manufacture of rifles, and the processes to be performed on the new object remained unaltered. Again the employment of women on a particular job, though new to the factory in question or even to the district, might be customary in other parts of England or Scotland. The Midlands could show thousands of women pressing, stamping, drilling, milling, dressing castings, core-making, assembling, even working on capstan lathes, and some of these were turning out articles for use in war such as fuzes, adaptors and cartridge cases. Any of these processes, if performed in an engineering shop, was entirely forbidden to a woman or a girl. Finally, there were very great numbers of women who merely replaced men on duties which had formerly been undertaken by either men or women. Familiar examples of trades in which this occurred have already been given. It is not too much to say that the majority of the women war workers were employed on work familiar to their sex, and often not widely dissimilar—except in the conditions under which it was done—from their ordinary occupations.

There were, however, exceptions to this, so interesting that they obscured the true state of affairs. Women on buses, policewomen and landgirls, women teaching in boys' public schools, and perched on ladders washing windows, women in gas-works and steel foundries and marine-engineering shops produced a comprehensive effect which was increased by the uniforms and working-dresses they wore, and by the fact that many of the war-workers were drawn from social classes unused to connecting their women-folk with factory life. There were reasons, too, which led to the position being misrepresented. It was in the interest of each employer, anxious to retain the skeleton of his male staff, to emphasize the length to which he had already carried direct substitution, and the returns made by them were found to reflect this anxiety. Moreover, it was in some districts easier to attract women to work which they believed served the purpose of releasing a man for the Forces than to obtain them for uninspiring women's tasks, where the drudgery and hardship to be faced were not even tinted with glamour.

Numerically, the changes in the employment of women and girls took the following course. The outbreak of war produced immediate unemployment. By Sept. 1914 about 250,000 females (8·4% of those employed in Aug.) had already left their jobs. This was the lowest point. By Feb. 1915 only 1·5% of these were still without work; by April the figures showed a surplus of 2%, and by Oct. 1915 the increase already amounted to 150,000. So far, however, it was still almost entirely in trades recognized as women's, or in work performed by both men and women. Of the 429,000 women and girls who entered the metal trades during the war, only 29,000 had entered by July 1915, though the effect of the Government's efforts to achieve dilution, which was made possible by the conferences held that summer, was shown by the fact that another 20,000 joined during the next three months.

By Oct. 1917 the percentage of women and girls to the total number of workpeople employed in industry, commerce, agriculture, transport and Government establishments had risen from 24% to 36% and nearly 1,500,000 women had been drawn into these occupations. By Nov. 1918 there was a 50% increase in the number of females employed in the same callings, representing 1,750,000, though, as has been stated, the addition to the total number of employed women was only 1,000,000. This is accounted for by the fact that over half of the 750,000 which makes the difference were persons who had previously been employed as dressmakers or domestic servants, while the rest had been outworkers of other types who were drawn into munitions work either by patriotism or by the superior interest and rates of pay. At the same time very large transferences of labour were taking place within the framework of industry, for by no means all of the great trade groups shared in the general war expansion. Thus, while industry proper, on a balance of prosperous and declining sections, showed an increase of just under 800,000, the figures for the textile trades fell by over 50,000, for paper and printing by 7,000, and for clothing by 56,000.

After the War.—From Nov. 1918 the fall in numbers naturally begins, but up to July 1920—which is in some ways a better date for the purpose of comparison than Nov. 1920, though figures for that month will be found in the tables accompanying this article—there were still 28,000 more women and girls in industry than there were in 1914, and 824,000 more women and girls in industry, commerce, the Civil Service, transport, hotels, theatres, etc., taken together. These figures amount to a loss of women for industry of 512,000, between the Armistice and July 1920, as compared with the 800,000 who entered during the war, and for the larger group of occupations already referred to a corresponding loss of 824,000 as against their gain of 1,648,000. On the other hand the 86,000 women in the women's services had all been demobilized, and so had most of the 60,000 women V.A.D.'s, who, however, being voluntary workers, have not been taken account of in these figures. In July 1918 1,458,000 women were stated to be directly replacing men and 1,874,000 were on Government work, including the Civil Service, the women's services and the land army, but not workers in hospitals. The last figure, however, must be accepted with caution, as many of the contracting firms were not in a position to make accurate returns, and others varied in their views of the basis on which their figures should be compiled. Firms accepting contracts to be filled from stock already in their warehouses could not tell, while the goods were in process of manufacture, which part would be bought by the Government and which by private firms, nor which of their private customers were purchasing the articles against Government orders. In addition to this, many workpeople were engaged for part of a day or week on Government contracts, and for the rest of their time on the firm's normal work. Some firms returned all their munitions work—a far wider and vaguer term, and one made continually more wide and vague by various decisions of the Courts—as Government work, and generally there was a tendency, in view of the privileges it conferred, to bring as much under this head as possible, even when the figures were supplied for statistical use.

These increases in the numbers of women employed in 1920 as compared with 1914 are interesting because they seemed to show that the war might result in a permanent growth in the industrial use of women. The natural growth of the population explains a certain part of them, but it should be noted that whereas the number of males employed had grown during the same period by only 177,000 on a 1914 figure of nearly 10,000,000, women had increased by between four and five times that number on a pre-war figure of 3,250,000. This discrepancy cannot nearly be explained by the casualties. Moreover in commerce and finance, where the rise for women is 344,000, there is an actual decrease for men of 155,000. These figures may alter again to the detriment of women; but, except in so far as bad trade causes general unemployment, there is no obvious reason why they should alter much. The replacement of the temporary women workers has not been left to economic factors which might be thought not yet to have operated to their full extent. On the contrary, non-economic pressure has in many cases prevented employers from keeping women they would have wished to keep. Under the Munitions of War Acts certain trades have been compelled to discharge all women and girls brought in to do work formerly done by men or boys. Trade agreements have had the same wholesale effects in other cases, though in both groups of occupations the natural tendency may be deduced from the fact that new firms, not within the scope of the pledges, are making a large use of women. And in addition to this practically every employer of women has been confronted by a campaign, both sentimental and practical and in some cases bitter, against their continued employment. It has been carried on partly by, or on behalf of, the returning troops, and partly by the men in the industries in which women had been working, and has certainly resulted in the dismissal of large numbers of them who were performing their work to their employer's satisfaction. These causes, though effective, are for the most part temporary in their effect, but those that tend to the increased employment of women are more lasting in character. The war advertised the fact that women are suited for a wider range of occupations than most employers—who as a class tend to be ignorant of what is going on in industry outside their own affairs and those of their immediate friends—had realized. They are also on much work very much cheaper than men. Before the war their average wages were about half those received by men for the same work. In many trades during the war this proportion rose to two-thirds. But even in 1921 in the work which women do well, this discrepancy was a good deal greater than the difference which would be warranted by the difference in their value to their employer; and wherever this is so the employment of men on that work, if women are available, must be regarded as a luxury. It is one of which many employers, for good and bad reasons, are most unwilling to deprive themselves, but falling prices and restricted demand will operate to increase the desirability of the women. Further, they themselves had learned to prefer a life outside the home, to employment within it, while the losses of the war and the diminished prosperity of the nation turned for many of them a matter of choice into one of necessity. It might therefore be thought probable that though the bulk of the work to which women were introduced during the war had by 1921 disappeared or been taken from them, their share of paid work outside private houses would remain considerably larger than it was before the war and also more varied, and it was likely that these new opportunities of employment would be large enough not only to absorb the new workers but also to draw upon the supply of those who would formerly have undertaken domestic service or employment in small workshops.

Number Employed.—The table on next page gives the figures of British women's employment for July 1914, Nov. 1918, and Nov. 1920; the numbers employed on Government work; and the numbers stated to be directly replacing men. It should be noticed that they do not include outworkers, or persons employed on their own account, or employers.

Workers Classified.—The first winter of the war did little more than absorb the workers who had been thrown out of employment during its opening months. They moved from one part of the clothing trades to another, from cottons on to woollens, and from cotton, too, on to metals, from little brass rings and tips and handles and discs and plates on to fuzes, from lace on to leather, and from the food trades into the filling factories. The conditions were more or less familiar, and as far as they could they chose work that was similar to their own, for at this stage no arrangements had been made for training any abnormal proportion of new workers. The supply lasted until the beginning of the next year, as is shown by the fact that of the 79,000 women who enrolled in March 1915 for the Women's War Register under 2,000 had been placed by June, as all vacancies were first offered to suitable applicants on the ordinary register of unemployed persons. When these came to an end industry could still be fed from the immense reserve of fit and experienced workers created by marriage. Former employees in the printing and paper trades, textile trades and boot and shoe trades, returned to the workshops in very large numbers, a few going straight on to munitions in the narrower sense, but most preferring to take up their former employment in order to replace men who had entered the army, or the younger women who were beginning to drift away to more enticing work. It was for the sake of the Lancastrian cotton weavers that the policy was adopted of scattering the new National Factories through the chief provincial towns of the north instead of erecting them in the old armament centres under the eyes of the great armament firms, and it was on their skill and experience that the Ministry of Munitions was able to base its new programme.

These married women perceptibly altered the type of woman munition worker. They increased the average age, and, being tied to their homes and so restricted in their field of possible employment, they reduced the amount of wastage. On the other hand they were in certain respects undisciplined—it was never found possible to apply to them, for instance, the provisions of the Munitions of War Act with regard to Leaving Certificates—and their bad time-keeping, due to the pressure of domestic duties, detracted from the value of their work.

Their movement into industry continued roughly all through the autumn and winter of 1915. They came partly as a result of the feelings that were aroused by their husbands attesting or entering the army, and partly as a result of the appeals that the Government were now making to them. By the spring of 1916, however, the supply was falling short. Congestion was increasing in the munitions areas, and many married women, instead of themselves earning wages in the factories, were taking toll of the wages of others, by letting rooms for sums which were sometimes increased concurrently with every increase in wage rates. Demand for women's labour was rapidly growing, and in March 1916 the Central Committee on Women's War Employment (Industrial) was set up by the Home Office and the Ministry of Labour, and established local committees to superintend on the one hand the recruitment of suitable women and on the other their housing, reception and general well-being outside the factory.

British Women's Employment, 1914, 1918, 1920.

Nature of Work	Women and Girls Employed				No. on Government work in July 1918	No. stated to be replacing males in July 1918
	July 1914	November 1918	July 1920	November 1920		
Building	7,000	31,000	9,900	9,900	18,000	11,900
Mines and Quarries	7,000	13,000	9,600	9,500	6,000	6,900

The new efforts tapped new sources of supply. Along with women from the normal industries of Great Britain totally unskilled workers had now to be engaged. They included dress-making hands, domestic servants, girls from school and married women unused to factory life. Of these the domestic servants, with their more adaptable intelligence, comparative readiness to take responsibility, and good physique, were perhaps the most valuable. They are stated by employers to have been much sought in marriage, and to have affected considerably the habits and outlook of the ordinary industrial workers with whom they were brought into contact. They certainly showed no eager desire to return to domestic service.

The married women were said to be less quick to learn, and less disciplined in the sense of observing regulations. On the other hand they were considered very hard workers, and in some cases—as was natural on the part of women, most of whom were soldiers' wives—formed a definitely anti-strike body during serious industrial disputes. The last class of married women to be touched were perhaps the village women, large numbers of whom were recruited by the land army, and taught afresh the agricultural work which had been familiar to their great-grandmothers. They were difficult to persuade, being shy and unwilling to defy village gossip, and further—as is so often the case with poor men's wives—they were chained to their houses by a lack of proper clothing, neither their coats, their skirts, nor their shoes being suitable or adequate for an outdoor life. It was only when outfits were provided, and the idea of women on the land had become commonplace, that it was possible to induce them to come forward.

The girls from school perhaps suffered more than any other class of women engaging in war work. They were particularly sought after by bad employers, for though quicker than any older woman to train, and often able to produce as much as an adult woman, their rates of pay were very much lower and they could be dismissed as soon as they demanded an adult wage. Even so, however, their pay was enormously more than the half-crown or five shillings they would have received as learners in pre-war days, and this, and the independence of spirit and habit which flowed from it, were supposed to exercise a widespread demoralizing effect. By the end of the war the output of the younger workers was said to have fallen, and great anxiety for their moral condition was felt by parents, officials and certain employers. It is, however, difficult to isolate this alleged fall in output from the general fall in output that was taking place in many industries, or to separate out the factors which caused exceptional demoralization, if any existed, in this particular class. It is certain that the end of the war found them in a more helpless position even than other women. Their training on munitions work was of little use to them when they sought to enter regular industry. It had been restricted as a rule to a few standardized operations on a particular garment or article, and employers refused to accept it as entitling the women to ordinary rates of pay on ordinary work. The learners' rates which they were prepared to give were in many cases little more than pocket money, and always quite inadequate to the support of adult women whose parents were as a rule no longer able or willing to maintain them. By lack of knowledge and of suitable clothing—here again a serious factor—by taste, associations and personal habits, they were disinclined to enter domestic service and unfitted for the life it offered, and at the time of the

Armistice they were acknowledged to constitute a serious problem and a grave responsibility for the Government which had recruited them. Efforts were made to deal with those still juveniles, but the large numbers who had reached the age of 18 during the course of the war were left outside them. At that date they were themselves very generally alarmed as to their industrial prospects, and it was agreed by all those watching the situation, including the trade-union officials, that if immediate training were offered under suitable conditions it would be possible to attract large numbers of them into domestic service, which was not only the one opening available but the direction in which their labours would be socially most beneficial. Schemes agreed to by the trade unions were put forward by the Ministries of Labour and Munitions, but the Treasury, though obliged to permit the payment of unemployment donation to women in idleness, were unwilling to allow the relatively small additional payment which would have coupled it with productive training. A restricted scheme was finally set up which provided training in occupations which had been recognized as women's work prior to the war, and within the limits imposed it was very successful. It was not, however, able to reach the bulk of the women who most needed it or to provide a satisfactory flow of recruits for domestic service.

The other great class which entered wage-earning occupations as a result of the war were the women from secondary schools and universities, who had looked forward to leading idle lives, or to entering the teaching profession. They flowed rather into commerce, finance, the Civil Service and the war services than into industry, but the comparatively small numbers who did enter the munitions factories exercised a disproportionate influence. It was they as a rule who made it possible to set up women foremen, supervisors, and charge hands, and it was generally those better educated women who were first placed on really skilled or technical work. The managing director of the one great marine-engineering shop which trained women to perform the whole of a skilled man's work done in that shop, *i.e.*, to perform any operation of which their machines were capable, accepted only girls from the secondary schools. He stated that in his opinion this degree of intellectual training was essential if they were to learn the work in the time allowed—about six months—and said, too, that his men made far less objection to training them than women of the industrial type whom they regarded as potential black-legs. The Ministry of Munitions Training Department also laid great stress on the importance of general education, going so far as to select only girls with a secondary school education for training in fitting and turning. The educated women had also a good effect upon conditions. Bad employers were restrained by their intelligence and independence from taking advantage of their more helpless companions, and good employers and welfare officers found them a useful channel of communication with the staffs when introducing health services, canteens etc. It is also probably partly due to them that the number of women trade unionists doubled during the war. The figures are said to be 350,000 for 1914 and 660,000 for 1918, but they only pretend to being estimates, and it is probable, owing to the tendency of women to enter their names after a meeting and then to lose all interest and pay no further subscriptions, that they are a good deal too high.

Women of a superior general training were found especially useful in instructing, commanding and supervising other women who had often in the past resented the elevation to authority of one of themselves. In the women's services and the land army this aspect of their work was of the first importance. On the land, particularly, their comparative acquaintance with the country, and their relative indifference to dark and loneliness, persuaded the town recruits to endure the terrors and discomforts of winter, while vestiges of feudal feeling gave them authority with the country women. In fact, wherever the work ceased to be purely physical, and more and more as it took on an intellectual quality the extent of a woman's education was found to determine her aptitude for learning and performing new work. The university women especially, in spite of the fact that those available for war-work were still largely of a uniform type—that which had been preparing itself for the teaching profession—found that their training immensely increased their comparative value in almost every direction, even where their instruction had not led up to, or especially fitted them for, their war duties. It is hardly surprising, however, that the best work of all from a technical point of view was done by those who had been specifically trained for the jobs they undertook, like the women physicians and surgeons and the women employed on scientific research in the National Physical and Chemical Laboratories. It is more to be wondered at that so much could be done by women and girls divorced from familiar surroundings, and set to adapt themselves to entirely novel systems of ideas, and to compress the training time of years allotted to men into a few months or weeks. Not even the atmosphere of the army can have been so foreign to the new soldiers—who as a rule had some notion of its main structure and had often experienced some form of communal existence—as were industrial and even commercial life to the girls who entered them from their day schools and their middle-class homes. And yet they adapted themselves to these new values, not only from duty, but with an enthusiasm and a quickness which seemed to show that the labour, and the variety and the tension, were congenial to their natures.

Quality of Work.—It is not possible here to attempt a final estimate of the qualities their work revealed, but testimony seems to agree on certain points. Above all they were conscientious; they were devoted. As long as they retained interest in their work they endured degrading conditions through monotonous periods of overstrain without apparently accumulating the resentment which from time to time flared out among their male colleagues; instead their health suffered. This tenacity was perhaps due to their stronger imaginative hold on the purpose to which they were giving themselves up. In relation to their environment, on the other hand, they were docile and lacked imagination; as a body they acquiesced in the conditions they found and made no concerted effort to change them. When they felt that the life was intolerable they left it, and the active combative temper of the men roused no response in them. As individuals they were less disciplined than men, less calculable, less impressed by traditions and institutions, giving an effect, for all their high spirits and quickness of tongue, of greater detachment. In the mass they were difficult to organize, elusive, fatalistic, sceptical and inarticulate. If they did combine they were faithful to their leaders, whom they preferred of a sensible and reasoning rather than of an idealistic type. Policy too, to obtain their approval, must be direct, concrete, and likely to produce an immediate effect. They were fortunate in their representatives, and the knowledge, ability and public spirit of the women trade-union officials secured for them an influence to which the numerical proportion of organized women would not have entitled them. Women might well have been proud to support societies to which they owed so much. But they seem as a rule to have left them when they left munitions work. They went back each to her private anxieties and hardships, showing no desire to continue banded together either to protect their interests or to continue their relationship, and seeking no outlet for the sense of injustice which some of them felt. A few of the ex-service women formed clubs and groups under the leadership of their old officers, but not the hundreds of thousands of munition workers, clerks and civil servants whose service took a more democratic form.

Effect on Industry.—It was not without difficulty that trade and industry were adjusted to fit these feminine millions. From the winter of 1914 the Government had been anxious to extend the use of women for the production of munitions, and in the summer of 1915 agreements were signed with the engineering unions which removed in theory the main barrier to their employment on men's work in the metal trades; but it was not until the spring of 1916 that substitution made any real headway. The employers had first to be convinced that they would not cause more trouble than they were worth, the factories had to be prepared for them, the work adjusted to suit their strength and skill, and, hardest of all, the men in each shop persuaded not only to submit to their presence but to coöperate actively in helping them to learn and to carry on their work. The women themselves meanwhile had to be trained. From July 1915 onward the Ministry of Munitions, in conjunction with the Board of Education, was teaching women with great success in technical schools and instructional workshops—for the first year, simple repetition work on shells and fuzes; later, work on aeroplanes and for positions as tool-setters, inspectors or charge hands; and, finally, the really skilled work of fitting and turning.

In all the Government schools trained 45,000 women, and very large numbers were trained by those private firms who preferred to give their own instruction. Under both methods it was found that they were good material, and that the period required before they could be fitted into their niches in the new schemes of mass production was shorter than anyone had thought possible. But the teaching of the women was the least of the trouble. To the last a certain number of employers were hostile to their introduction, and by more or less overt collusion with their staffs could make it impracticable or unsuccessful. Where this was the case the only weapon of the Government was to create a shortage of labour in their works by removing their War Munitions Volunteers and adopting similar coercive measures. This could not always be done in the face of the representations which the firm were nearly always able to secure from the Supply Department with whom their contract was made, that upon its instant fulfilment depended the issue of the war. Employers anxious to support the Government as a rule found the carrying on of their work under war conditions sufficiently harassing with a competent male staff: they could not be expected to welcome a change which meant providing special new accommodation—a much more troublesome matter than might be supposed in town factories where every inch of space was already needed; reconsidering each one of the methods to which they were accustomed, and antagonizing their staffs, in order to bring in labour certain to be relatively inefficient for the time, and of unknown potential efficiency. Their grounds of objection were substantial and their position strong, and it is to the credit of industry that some of the larger firms forestalled the Government in their introduction of women's labour. To effect this it had been necessary to bring the bulk of the work—all of which in some firms had hitherto been carried on entirely by skilled men—within the average capacity of untried and almost unskilled persons. Of the three grades into which it could be roughly divided—skilled, semi-skilled (which included the repetition work), and unskilled and labouring work—the last required the most adjustment and was the least easy to adjust. Every device that was possible was provided, regardless of expense, to minimize the strength required in lifting, hauling, loading, stoking, scraping boilers, and the specially hot and heavy work done in foundries and retort-houses, chemical works and tanneries. At the end of it all, the employment of women on this work was costly and ineffectual. Three women were needed on an average to do the job of two men, and at special points one man's work would occupy two or even three women, while the hardest jobs had now to be performed continuously, instead of as part only of their task, by the remaining men.

On repetition work the sweeping changes that were made were due not so much to the sex of the new operators as to war conditions. The subdivision practised was the natural result of mass production, and has remained where mass production has remained, though men have replaced women at the machines. The fool-proof devices were a protection against the lack of experience of the dilutees, whether men or women, and they too have survived as a means of decreasing worry and improving output.

On neither of these grades, where they already existed as such, did the men make serious opposition to the coming of women. The general unions to which most of them belonged were not before the war the centralized and powerful bodies they are now; they had been able to establish few privileges, and their men were at the mercy of the recruiting officers. They therefore treated the matter as one of individual feeling rather than of labour policy, and were entitled to more gratitude than they received from their country for the unselfish way in which most of them helped the women who were to fill their places and make it possible for them to be spared for the army. It was the splitting up of the skilled work, and the consequent reduction of many of its parts to a semi-skilled rank, which produced the bitter opposition which increased rather than diminished as the war went on. This was due in some degree to mass production but more to the shortness of the training which was all the urgency of the times allowed. The strength of the women was insufficient for labouring work, but by the end of the war it became clear that they did not lack the intelligence and character necessary for the acquirement of an exacting technique. What follows is the official verdict of the Ministry of Munitions:—

"Many women might become skilled mechanics, given the necessary training and experience. But these were precluded by the conditions under which munitions were manufactured. Intensive training sufficed to meet the emergency of the moment but it was no substitute for a thorough apprenticeship; and the (male) apprentices who were up-graded under schemes of dilution suffered like others from premature specialization. Subject to this limitation, there were few branches of skilled work which some women did not execute with success. They made tools and gauges to the finest limits, they set up complex automatics, they machined and fitted the most delicate mechanisms, they inspected the rifling of guns and mastered the use of the micrometer and vernier, they conducted scientific tests in the laboratory, they acted as charge hands and forewomen."

Had the war continued they would have been used upon this work in increasing numbers. As things were, however, it was more economical, given the large output, to train them and the male dilutees with them, to do one particular part of the complex job which a skilled man had been accustomed to carry out, and whose more difficult portions only were now left for him. Most of the work of a skilled category given to women was actually work which had been treated in this manner. For such subdivided tasks they were found perfectly suitable, and the checks to their more extensive use were, in the first place, the uneconomical rates of wages which the men's unions had imposed as the price of dilution; and secondly, the almost desperate opposition with which their employment was met by the skilled men. It was not only the employers who objected to giving a woman the full rate of a skilled man when all she could do was one among his many different jobs: the men actually working with them, however much they agreed in principle with the system of the rate for the job, could not bear with equanimity the sight of raw, unqualified women receiving wages almost equal to their own.

The obstructive policy pursued by the skilled unions was directed as much against mass production in general as against women in particular. They knew that the women must go after the war; but they feared, not unnaturally, lest the new methods and processes should stay, which meant working toward a state when the skilled man who could not find employment in the tool-room, or as a supervisor, or on experimental work, would find himself degraded to the position of a machine-minder, with his privileges gone, the interest of his life as a craftsman gone, his standard of living in danger, and the prospect before him of becoming gradually merged in the masses of the semi-skilled. Much of this had happened in America, and the utterances of certain employers gave ground for thinking that in England it was at least desired. In small sections of the metal trades they could almost see it coming to pass. On sheet-metal work, for instance, machines and processes were brought in by which women and boys could perform rapidly and cheaply work which had been slowly done by hand by skilled sheet-metal workers. The men were released for the army and left knowing that their work would be gone if ever they came back. It was no wonder that opposition was felt at such a time to this acceleration of the process by which industry develops for the benefit perhaps of future generations but to the hurt of those whose whole equipment for life is their suitability to one of its changing industrial phases.

If this was the origin of the continued disputes that attended the incoming of the women, they were embittered by the fact that nothing was more vague, or varied more from district to district, than workshop practice with regard to demarcation of work. Some shops were entirely staffed by skilled men and apprentices; others did the same work with a few skilled men and a residuum of semi-skilled machinists, unskilled men and boys. Claims were put forward by the unions that work should be treated as skilled and carry the skilled man's rate—which would have covered half the work habitually done by boys; and the employers on their side seemed to consider that the slightest change in a job handed over to women dropped it at once to the minimum labouring rate. These quarrels, at first more or less local, so far from being settled were growing in intensity when the Armistice removed their cause. They did not begin until the autumn of 1915, when the introduction of women on to certain machines in Glasgow opened the troubles on the Clyde.

As will have been gathered, permission to employ women on men's work in the engineering trades had been gained at the price of a wages settlement, intended not so much to benefit the women as to protect the skilled man's rate. It maintained piece-prices and stated that the skilled man's time-rate must be paid to women undertaking a skilled man's work. These compacts, known as the Shells and Fuzes Agreement and the Treasury Agreement, were arrived at in March 1915 between the Government and the engineering unions, and it was hoped that dilution would immediately follow upon them. Unfortunately they did not produce the results expected, and in July it was found necessary to supplement them by statutory powers under the Munitions of War Act. In Sept. the new Ministry, impelled by a pledge given by Mr. Lloyd George in July that there should be no sweated labour in the munitions trades, appointed a committee to settle the wages of the women, who were by this time fast entering the metal trades. The committee, representing the Ministry, the trade and the women, recommended the time-rate of £1 a week for women on men's work other than skilled men's work. This rate, though finally nearly doubled by the awards issued from time to time by the special Arbitration Tribunals to which claims for increases were referred by the Ministry of Munitions, remained the basis of their payment throughout the war, and the standard by which wages were unavoidably fixed for other classes of women. Thus women on munitions work other than men's work came finally to a basis rate of 5½d. per hour. The £1 rate was imposed on the National Factories—already among the largest employers of women—and handed on as a recommendation to private munitions firms, a method which was found inadequate to ensure payment. It was therefore embodied in a Statutory Order, binding upon all controlled establishments under Sec. 5 of the Munitions of War Act. From that moment State regulation of the wages of women on munitions work, under pressure from trade unions representing both the women entering and the men displaced, became more comprehensive every few months, until at the time of the Armistice the Ministry of Munitions' orders covered about 2,000,000 women employed in 27 trades, and a similar number were covered by arrangements made with the Admiralty and the War Office. The work of dealing with women's wages was then taken over by the Ministry of Labour in accordance with the provisions of the Wages (Temporary) Regulation Act, which lapsed only in the autumn of 1920, leaving the general level of women's rates in the trades affected at about three times the very inadequate amounts—11s. to 12s. on an average—that had been usual before the war.

This regulation was the price of dilution, and it was only natural therefore that men anxious to oppose dilution should pick endless quarrels with the interpretation placed upon the wording of the agreements and pledges by the Government departments concerned, and also with their carrying out of their own orders. Into the details of these controversies it is not possible to enter here—the whole subject is covered by the report of the War Cabinet Committee on Industry which sat to consider the question, as well as to deliberate on the theoretical problems of women's wages. On the whole it may be said that the real basis of the men's charges was their objection to dilution and not any important dereliction on the part of the Government. Until the end of 1920 the women in the industries which had been engaged on war work were adequately protected, and they themselves realized this, and showed that they did so by the steadiness and docility with which they continued to work in the face of incitements to unrest. From first to last the time lost by strikes among women on munitions work was negligible, and only one case was brought to light where they were really restricting output.

While this was going on in the munitions trades proper—which included among others shipbuilding, engineering, electrical engineering, ordnance and aircraft work, wire-rope, cables, hemp-rope, tubes, iron and steel manufacture, scientific and optical instrument making, and the manufacture of explosives, chemicals, rubber, asbestos, packing-cases, and tin boxes—the recruiting crisis which took place in the winter of 1915 forced other trades to take steps to denude themselves of men and carry on with women's labour. This was done as a rule under national agreements between the unions in a trade and the employers, and it was generally made clear that the work handed over to women would be relinquished by them at the end of the war. They also dealt as a rule with wages, laying down rates which equalled in some cases—though not as a rule in industries where women were expected to be admitted to truly skilled work—the whole man's rate. For instance, women on men's work on the railways or on process work in the seed-crushing mills, started at the man's minimum rate, but most of the agreements provided roughly for equivalent pay for equivalent work. Allusions were also made to the conditions under which the work was to be done and to measures designed to protect the women from injury to their health. These agreements were concluded without much friction and were carried out as a rule in a generous spirit.

Agricultural Work.—The other great industry where the introduction of women caused trouble was agriculture. In spite of the efforts and the efficient organization of the Women's Land Army, and in spite of the satisfactory work acknowledged to be done by the women, the increase in their numbers during the whole war was only 33,000—less than 50% on the 1914 figures of 80,000. To these must be added some of the women entered under the head of casual labour, but it is not a good turnover for a trade employing so large a number of men. The cause was partly the obstinate refusal of the farmers to employ women—which in itself rose in part from their dislike of parting with labour often consisting of their relatives and always more closely tied to them than the town workman can be to his employer—and partly to the fact that work on the land did not prove attractive to women. The country women were not of the temperament which embraces novelties, and the town women disliked being billeted among the hostile farmers, and also the discomforts of a country winter. In the few districts where the custom survives of women working on the land, such as Eversham, a district of small-holdings, there was further discouragement from the country women, who disliked the introduction of "dressed-up" strangers into the fields where they were accustomed to work in their ordinary long clumsy skirts. It was finally found necessary for the land army to cover the country with an organization which would keep in touch with practically all its members, to provide boots and outfits for recruits, to arrange for camps where women could live together, and in short to abandon the view that women could be expected to go on the land as self-sufficing units. As an army—an alien force imported into the countryside—it was found possible to introduce them to all the lighter and much of the more skilled work of agriculture with excellent results, but it is probable that only after two generations of such employment would the industry be prepared to admit that the experiment had been made and had proved successful.

The Civil Service.—In the army, navy and the air force the prolonged resistance with which the idea of employing women was met for so long came entirely from the employing or official side. By their male colleagues they were received not only with acquiescence but with pleasure, and as they had obviously to live in segregated units they were not grudged their inevitable proportion of responsible and well-paid posts. Into the Civil Service, on the other hand, they were early welcomed; but, once there, only a very few individuals from among the 162,000 recruits, who included numbers of women with university degrees, were given any opportunity of earning any salary that any man might have envied, or of rising to any work superior to that of secretaries and clerks. Where they were found in such positions it was almost invariably either as supervisors of the women staffs or because the work of their branch related to women and the appointment had been made as a concession to public opinion, as in the case of the women in the Ministry of National Service, and the Women's Wages Section, and the Welfare Section, and the Dilution Section of the Ministry of Munitions. The most liberal department in employing women on well-paid work which might have gone to men was the Ministry of Food.

It may be said that, even in the establishment divisions, their appointment represented a victory, for so late as the autumn of 1915 one Service department, employing thousands of women and girls, was refusing to pay any of its women university graduates more than 40s. a week, or to provide the staffs with a single woman in authority to whom they could go if in difficulties. Hardly at all, and only by the new type of minister, was the policy pursued of bringing in distinguished women to deal with special women's problems, although men with special experience were brought in by the dozen. Such an experiment would have been of very great value. The demobilization of these enormous bodies of women took longer than had been expected; in fact, it had hardly begun when the passing of the Sex Disqualification (Removal) Act made it necessary for the Civil Service commissioners to consider the terms on which they should be admitted to the higher grades of the permanent service. The task of framing the general principles under which they might enter was entrusted by them to the newly formed National Whitley Council for the clerical and legal departments of the Civil Service, which, as it happened, was preparing to bring forward a scheme of reorganization for the entire service. This scheme, since agreed to by Parliament, provided that, with certain exceptions, women were to be admitted to the general work of the Civil Service with the same status as men. They were not, however, for an experimental period not exceeding three years, to receive the same pay for their work; and they were not to compete for posts with men but were to be appointed to a special proportion of posts which each department was to reserve for them; nor were they to enter by competitive examination but were to be chosen by a selection board. These conditions, especially that dealing with pay, were accepted by the women's representatives under protest, as they considered that the Civil Service together with the teaching profession were fields in which equal pay was not only eminently just but peculiarly desirable, and its opposite calculated not merely to injure the prospects of the women directly affected but to diminish their opportunities of doing valuable work. It was necessary, however, to accept such terms as part of the temporary bargain, and the Treasury proceeded to appoint a Director of Women's Establishments and to persuade, or endeavour to persuade, those branches of the service—such as the National Physical and Chemical Laboratories—where women scientists selected solely for their ability had been receiving the same salaries as men, to reduce the scales of the women on their staffs in accordance with the new arrangements for the clerical class. They took no steps, however, to admit women to the higher grades of the service, preferring to suggest that the Government should remove from the purview of the Whitley Council the question of the employment of ex-service men in the Civil Service—one of the matters definitely referred to it under its constitution—and hand it over to a committee largely composed of members of Parliament. Under shelter of the recommendations of this committee, which were at once adopted by the Treasury, even though they conflicted with the agreement signed by the same officials, the principle of admitting women to the general work of the service was abandoned, and ex-service men were appointed to all posts of which it could not definitely be said that it was impossible to employ anybody but a woman, including a number which had always been filled by women because they were concerned with the health, welfare, wages, or conditions of women. The appointments were made possible by a process of combing-out which took no account of qualifications, knowledge, or experience, and concerned itself solely with financial considerations.

On Aug. 5 1921 a debate took place in the House of Commons on the regulations framed by the Civil Service commissioners for carrying out the Whitley scheme. It was pointed out on behalf of the women that the regulations ran counter to two separate votes of the House in favour of equality of treatment; and a motion was brought forward designed to secure for women the same pay and the same conditions of service as are enjoyed by men doing the same work. Under pressure from the Chancellor of the Exchequer a compromise was finally accepted under which the regulations were confirmed for three years; a promise was given that after that time women should be admitted in the same way as men—except that the Civil Service commissioners should have power not to appoint a woman to any post for which they considered a woman unsuitable—and work under the same conditions as men, except that they might not marry; and that the question of equal pay was for further consideration. It was also promised that women establishment officers should be appointed in departments employing considerable numbers of women; but a motion to the effect that some women should be admitted to every grade was not accepted.

Industries Chiefly Affected.—The most striking transfers of work from men to women naturally took place in the aircraft and metal munitions trades, because it was they which expanded most during the war, and they also were the objects of special pressure from the dilution authorities. What that pressure amounted to may be shown by the fact that in Jan. 1918 firms working for the Admiralty, which controlled its own dilution, employed 458,000 males and 52,000 females, while firms working for the War Office, Ministry of Munitions and Air Force employed 476,000 males and 235,000 females. In Nov. of the same year the Royal Naval Torpedo Factory, Greenock, employed 2,706 males and 372 females—13.7%; while Woolwich Arsenal employed 40,000 males and 24,000 females, or 60% of females.

Next perhaps comes transport, with its uniformed women driving cars, collecting tickets and acting as conductors, guards, goods porters and signal-women. After these and the land, the change was most easily seen in the brewing industry, and in hotels and public-houses, both of which successfully employed large numbers of women on men's work during the war. Possibly 25,000 women came on to aircraft wood-work during the war.

In aircraft work, women in one Government factory by the end of the war were making the entire fuselage, including the really skilled work of propeller-shaping, and all over the country they were making, covering, and doping the wings, and doing all but the heaviest erecting. This is essentially mass-production work, as every smallest stick is cut to its size before the women touch it, and, as such, it is women's and not men's work, and peculiarly suited to them.

Women's Work Characterized.—It may be said that now for the first time the industrial capacity of women has been minutely considered by critics both hostile, impartial, and biased in their favour. The results of this scrutiny, from whatever source, are favourable, and fairly uniform. The women were more adaptable than the mass of observers had supposed them, they possessed more latent intelligence and greater physical strength, and they withstood far better the effects of monotony. On the other hand, as compared with men, they possess certain general defects which may be summed up as follows: insufficient strength; lack of initiative; lack of interest in the technical side of their work or desire to improve their position by training or qualifying for work requiring more skill or responsibility; comparatively bad health; lack of care in dealing with machines, materials and tools supplied by the employer; lack of steadiness—shown in the frequency with which they left their situations; their bad time-keeping and irregular attendance. It was also frequently given by employers as a reason against their employment that, where they were working with men, the men's output tended to decrease until it was no more than the women's. Excluding labouring work, they were said as a rule, when on men's work, to be worth two-thirds of a man, but where details were given the discrepancy appeared to be less. On some work—light repetition work or work where skilful fingers were required—they were universally acknowledged to be better than men, turning out more work and more contented. On more skilled work demanding more individual variation they were said to produce from 40% to 60% of a man's output. These complaints were put forward as characteristic of women, but it seems possible that some at any rate were characteristic rather of the conditions under which women work in industry. The first contention—that they lack the strength of men—is of course true, though women are stronger than the pre-war employer with his underfed girls was apt to imagine. The progressive improvement that took place in the health and output of those employed under anything approaching reasonable conditions with regard to hours and lodgings showed the effect that good wages, good food and a certain amount of care will produce in even a few months. Moreover, a great deal of the work that men are now expected to do is not only too heavy for women but too heavy for men as well, and ought not to be imposed on any human being. The result of this is that men employed industrially are more and not less adversely affected by the conditions of their work than women, though their health again is greatly superior to that of married women working in their homes—the most suffering class in the community. But, obviously, women are not so suitable as men for heavy work and cannot be made so by any methods which can be foreseen. The most carefully planned schemes all ended by being prohibitive in cost. Another group of defects, their lack of discipline, their bad time-keeping and bad attendance, were really alleged against the married women hampered by household duties. Single women were as good time-keepers as men. If they changed their situations more often it was often due to preoccupations arising out of the war. They wanted to be near the hospital to which their brother or lover had been sent, or they wished to change from shells to aircraft work because their man had entered the air force. All this population of women was preoccupied: often too they had taken up work for the first time without much considering the wages paid and, as the pinch of the war made itself felt, found themselves obliged to go where they could earn enough to keep themselves.

Their lack of initiative and ambition was put down by the employers as due to their knowledge that the work was temporary, and would be brought to an end either by the end of the war or by marriage. The trade unions frequently added that employers, for the same reason, would not be willing to give women a lengthy training. It is probably true that the majority of wage-earning women are so affected by the expectation of marriage that they are unwilling to expend mental effort on their work. But it should be remembered, on the one hand, that the wages of women before the war were so low as seriously to affect their vitality, and, on the other, that the experiment of offering them training in skilled work had never been made. They are perfectly ready to learn weaving, or the skilled work in the dressmaking and millinery trades. The experience of the war would seem to show that a minority of women would welcome it and benefit by it in other occupations. Another thing shown by the war is that apprenticeship periods for the skilled trades, though convenient both for masters and men as long as the school-leaving age remains where it is, are far longer than is necessary to secure industrial efficiency. A skilled worker cannot be produced in six months, but that does not mean that his apprenticeship must last for five or seven years. If anything were to occur which modified this period the increased employment of women on skilled work would become more feasible.

Lack of initiative, lack of care and lack of attention to detail are more fundamental charges. They are possibly true, though to what extent they are true can hardly be proved by the experiment made under war conditions. Most of the women had been living in circumstances which precluded the development of initiative or a scientific thoroughness. Very few minds show initiative with regard to a totally unfamiliar technique so fenced about with terrors as engineering, so immemorially fixed as work on the land or so trivial as most clerical occupations. Nor, to put it mildly, was women's initiative encouraged during the war, though without it there would have been no women doctors and no women in the fighting services. And as those responsible for the education of naval officers know, this quality, like others, reacts to stimulation. What is certain is that in the strength and skill of its women the war showed that Great Britain possesses a valuable industrial resource, whose wider use under suitable conditions would benefit both the women themselves and the industries they entered. Before such conditions can be established, however, a number of problems must be faced, including the determination of the proper ratio of a woman's wage to that of a man performing similar work. (A. B. W.)

UNITED STATES

In 1916 there were probably about 10,000,000 women wage earners in the United States, comprising about one-quarter of the total number of persons gainfully employed. In manufacturing there were about 1,500,000, three-fourths of whom were in the food, textiles, tobacco and wearing-apparel industries, but very few in those industries producing implements of war. The first demands for women were met, as in England, by drawing seasoned workers from such industries as the lighter textiles, millinery, corset-making, domestic service, laundries, stores and offices. After the supply of seasoned workers was exhausted, efforts were turned toward securing women outside the wage-earning class. Married women, many of them former industrial workers, were urged to return to industry. Part-time work was offered and occasionally a day nursery was established. In one city an organized publicity campaign for new workers resulted, after the first two weeks, in a 50% increase in employed women and after the first four weeks in a 100% increase. It was estimated that about 4,000,000 women were employed in war trades and that 2,500,000 remained in the newer fields in 1919.

English experience taught the American authorities to keep the most skilled men at home where they could continue in their usual fields of work, but in attempting to supply the increased demand for workers two main problems arose; first, to secure women to fill routine or semi-skilled positions; second, to secure in those industries which were greatly swollen by war demands not only routine workers but also skilled employees. The demand for additional women in war industries was well illustrated by conditions in the iron and steel industry, where, in 1916, less than 4% of the employees were women. During the war in every branch of this industry the number of women employed increased, between the first and second draft, from 18% to over 200%. In the industry as a whole the increase was nearly 70%, while the number of men increased only about 5% and in some branches actually decreased in numbers. In 111 plants making explosives only 73 women were reported in 1914, whereas after the second draft, 25 plants employed nearly 12,000 women. In this industry women constituted about half the total employees. In the manufacture of hand grenades, about 19 out of every 20 were women. In one gas-mask plant with 12,000 employees, 8,500 were women.

Industries showing the largest per cent of increase in the number of women after the second draft were cars, steam and electric railways, automobiles, metal and metal products, lumber and its remanufacture, chemicals and allied products. Industries showing decrease in per cent of women employed were textiles, hat and cap making, tobacco and tobacco products. Industries showing the greatest ratio of substitution were motor-cycles, bicycles and parts, cars, steam and electric railways, automobiles, airplanes, seaplanes and parts, ship and boat building, agricultural implements, lumber and its remanufacture and iron and steel; the latter industry substituted by far the largest number of women. In practically no case did all the different establishments in any industry employ women and an even smaller number substituted them for men. The practice of the employment and substitution of women was largely a matter determined by the individual establishment. In iron and steel, for example, out of 2,140 firms reporting after the second draft, only 1,011 employed women and only 430 substituted women for men.

Before the war women were employed in clerical work in connexion with the railways and as ticket sellers on a few street railways. One of the most striking war innovations was the employment of women in such positions as station agents, ticket sellers, cleaners, section hands, and elevator operators, in connexion with the railways, and as conductors on the street railways. It is estimated that by Oct. 1918 there were over 100,000 women employed on the railways, and many large cities had installed women as conductors on the street cars. In N.Y. State alone 2,180 were substituted for men on the steam roads and 1,346 on the electric roads. In this state a law was passed limiting hours of women on street cars to nine a day and prohibiting night work between 10 P.M. and 6 A.M. In Wisconsin hours were limited to eight a day and night work was prohibited between 5 P.M. and 8 A.M., which practically prevented the employment of women on street cars during the rush periods. Other large cities employing women and limiting their hours were Chicago and Boston as ticket agents, and Kansas City, Detroit and Cleveland as conductors. In the latter city a controversy occurred over their continued employment, involving several hearings before Federal authorities. The men's union was strongly opposed to them and finally secured an agreement with the company to dismiss all the women and reinstate the men which was carried out early in 1919. A similar situation arose in Detroit with a similar result, but in Kansas City the union did not oppose the women and the War Labor Board ordered equal pay for equal work. In most cases the women were out of the service by 1921, but on railway work 81,000 were reported as still employed in Jan. 1920. The majority of these were in clerical positions, but there has been also a permanent increase in the number of women employed as station agents, ticket sellers, watchmen, and in the business offices. When the roads were under Federal control, the minimum monthly salary for clerical positions was fixed at $87.50, while executive positions often commanded as much as $225 a month.

Efficiency.—The new fields of work tested, as never before, the abilities of women. Although before the war women were employed in practically every kind of work, they were usually occupied on routine or standardized processes. But the war opened to them a new door. "Instead of 'tending' or 'tripping' or 'feeding work,' measured and marked for her, into a machine especially adjusted or constructed to perform a specialized or standardized process, the emergency created by the war forced the experiment of teaching the woman worker to read blue prints, to understand the characters of different metals, to grasp the purposes and capabilities of various machine tools, to adjust their mechanism, to set up, to measure and to mark her own work and be responsible for its quality as well as for its quantity." In these new fields there were of course failures, due sometimes to personal defects—but more often to ill-advised assignment of tasks, lack of proper instruction and supervision such as was so successfully carried on in English munitions work, and also because of lack of proper equipment and accommodations for women. It must also be pointed out that because of America's shorter war period there was but little time for technical training. Although a few trade schools were utilized, reports indicate that training was usually done by the "foremen," "forelady," "skilled operators," or "the gang boss." On the whole, however, testimony of manufacturers from all parts of the country, as reported by several independent investigations, agreed that the women were unquestionably successful. The output of women, according to 66 firms out of 99 in the important metal trades, "was equal to or greater than that of men in the operations in which both were employed." In another investigation from 50% to 90% of the managers in a variety of industries reported that the production, attendance, and promptness of women was equal to or greater than that of men. Employers stated: "On our 24-in. Fellows gear shapers the women turn out from 20 to 30 more pieces in a 9-hour day than men." "In our filling and burring machines . . . they overrun the men about 250 pieces." "On our drill press work . . . they have increased the production 1,200 pieces in a 9-hour day." The president of a recording and computing machine stated: "In the machine department women became expert and got out much greater production in running turret lathes, punch presses, bench lathes, milling machines, drill presses, grinding machines and engraving machines, and in addition to the operation of these machines we taught them to grind their tools, to act as job setters, and to superintend some of the departments. In the inspection department practically every inspector was a woman. In the assembly departments, as well as in the inspection departments, all were women, and they did better work and got out more production than men whom we tried on the job at various times without success. We found, too, that we could place as much, if not more, dependence on women in coming to their work and remaining on the job, which accounts for our having the lowest turnover in help in any factory ever heard of, which was less than 4% per year. We taught women to inspect tools and check them over according to the drawings after they came from the tool shop, in which department women became expert." Although much of the work done by women was repetitive and semi-skilled, requiring mainly dexterity and lightness of touch, yet testimony shows that they frequently and successfully competed with the highly skilled men.

Standards of Work.—In Oct. 1918 the Women in Industry Service (later the Women's Bureau of the Labor Department) formulated certain standards intended to govern the employment of women. These standards were indorsed by the War Labor Policies Board and after the Armistice were revised to serve as a basis for a programme for reconstruction. The recommendations included the 8-hour day, Saturday half-holiday, one day of rest in seven, and the prohibition of night work between 10 P.M. and 6 A.M. They urged equal pay for equal work and an occupational, rather than sex, determination for wage rates, with a minimum which would cover the cost of living for dependents as well as for the individual. Proper conditions of work were specified, and included the prohibition of employment where poisons which are more injurious to women than to men were used. The standards also urged that joint negotiations between employers and employees be established for enforcement purposes. The War Labor Policies Board ordered all contracts of the Federal Government to require full compliance with the labour laws of the state in which the goods were manufactured.

Hours, Wages and Conditions.—With but few exceptions pressure of work did not reach the high pitch which England experienced, and, on the whole, hours and conditions of employment in the United States did not greatly change as a result of the war; the United States profited also by England's experience in regard to the futility of excessive hours of labour, and although many attempts were made to enact state laws which would abolish or lower the existing standards, public opinion was against this movement and on the whole these attempts failed. Less than a dozen states had laws prohibiting the night work of women and the practice of the Federal Government of referring to the state labour departments for investigation any request for permission to exceed legal hours, resulted in a fairly general conformity to existing legislation. In a few cases where night work was not prohibited by law, women did take their turn in the night shift.

Rates of wages during the war fluctuated greatly and several intensive studies were made. One of the larger studies reported only wage rates and showed that in the majority of cases women's wages were admittedly lower than men's. Probably the most exhaustive study was made in N.Y. State by the Women's Bureau of the Labor Department. This study covered 117 plants and 13,643 women who replaced men. Of these women 56% received only two-thirds to three-fourths of the wages paid the men for the same work. Two-thirds of the women received less than $15 a week, and only 190 received $20–$25 a week. From this study it appeared that wages had practically no relation to production or to efficiency. In 11 plants reporting that women produced more than men not one woman received as much as the men and the majority received about three-fourths of the men's wage. Several states and the Federal Government established minimum wage rates in certain occupations for the war period ranging between $13 and $16 per week. A Federal report indicated that in practice the time-rates of women seldom equalled those of men. Piece-rates were frequently the same for both sexes, but the guaranteed wage for the women was usually lower than for men. Another report stated that women's wages ranked about with those of boys—and often with pre-war standards for boys.

General Results.—An important test of woman's efficiency was her permanence in these newer occupations. On this point one investigation reported that "of all plants employing women in men's places over one-half are going to retain every woman so employed, second that 82% are going to retain all or part of the women so employed." In the leading war agency and implement industries the proportion of women per 1,000 wage earners in 1914 was 65; in Oct.–Nov. 1918, 139; in Aug. 1919 the proportion was 100. The reasons for retaining women were of course varied. In addition to questions of efficiency other factors entered. It has already been pointed out that women's actual wages were almost universally lower than men's. Many employers frankly gave as their reasons for retaining women: "greater production at lower wages"; "better work at lower wages"; "they produce more and demand less"; "to fight the union." One report stated that "women are staying at their new posts primarily because they permit manufacture at less cost per unit of production and with less friction between management and workers."

On the whole, and particularly in comparison with England, there was very little special machinery created during the World War to deal with problems of women in industry. Canteens were set up here and there, an occasional day-nursery was established, employment management and personnel work were stimulated, welfare work and supervision were frequently introduced, but there was no large movement to direct and supervise "dilution," no munitions tribunals with their "leaving certificates" and but few attempts on the part of the Government, either state or Federal, to regulate wages. Except in a few cases there were no serious clashes with men's trade unions, and the post-war problem of women in men's places adjusted itself without state interference.

The principal sources of information are: (1) *The New Position of Women in American Industry*, published in 1920 by the Women's Bureau of the U.S. Department of Labor, Washington, D.C.; (2) *The Industrial Replacement of Men by Women in the State of*

New York; published in 1919 by the Bureau of Women in Industry of the N.Y. State Industrial Commission, N.Y. City; (3) the publications of several manufacturers' organizations, such as the National Industrial Conference Board, N.Y. City, and the chambers of commerce of various cities. (I. O. A.)

WOMEN'S WAR-WORK.—It would be impossible here to attempt to describe the special war-work done by women of all the belligerent countries in 1914–8; and this article is confined to an outline of women's war-work as organized in the United Kingdom and the United States, beginning with the former.

United Kingdom

The general dislocation which ensued in industry threw numbers of women workers in the United Kingdom out of employment. At the same time women of independent means, moved by patriotism, came forward in large numbers with offers of voluntary service. It soon became apparent that the well-meant action of the non-professional women was likely to press heavily on the position of the unemployed wage-earners; and accordingly on Aug. 20 Queen Mary inaugurated the "Queen's Work for Women Fund," technically a branch of the National Relief Fund, to provide employment for as many as possible of the women thrown out of work by the war. The Queen's collecting committee, with Lady Roxburgh as hon. sec., raised the money, but the administration of the fund was in the hands of the Central Committee on Women's Employment, a Government Committee under the chairmanship of the Marchioness of Crewe, with Mary Macarthur (d. 1921) as hon. secretary. The problem of the Committee was to help to adjust the dislocation of industry, so that unemployed firms and workers in a slack trade might ease the overpressure in other trades. Firms unused to Government work were assisted to undertake War Office contracts, and orders were placed with small establishments employing women, who would otherwise have had to relinquish their businesses. Over 70 special relief workrooms, through which about 9,000 women passed before Feb. 1915, were managed by women's employment sub-committees of the local representative committees set up by the Government Committee on the Prevention and Relief of Distress. Articles made in them were not offered for sale, and were supposed to be educative to the worker. New branches of the toy-making industry, in which there was a possibility of capturing German trade, were started in various private relief workrooms, and became paying business concerns.

The distress among the professional classes caused by the dislocation of work was very great, and the Professional Classes War Relief Council, consisting of representatives from the chief professional institutions and the principal societies organizing relief work, was formed to cope with the trouble in Oct. 1914. The Council dealt chiefly with education, maternity assistance, training, and the organization of concerts for the employment of musicians, who, as a class, were particularly hard hit. The Society for Promoting the Employment of Women opened an educated women's war emergency training fund for a year, which trained out-of-work governesses and journalists to take posts in banks; and hostels were opened by various private committees for ladies in distress owing to the war.

On Aug. 3, before the official declaration of war, the executive committee of the National Union of Women's Suffrage Societies under its president, Mrs. Fawcett, decided to suspend political action (*see* Woman Suffrage) and devote the organizing capacity of the Union to meet the changed conditions. Within a week the London branch, with Miss Philippa Strachey as secretary, had started a free bureau under the name of "Women's Service" to direct the efforts of the thousands of non-professional women eagerly desirous of finding useful work. Over 1,300 volunteers were placed before the end of 1914. Many young women began at once to prepare themselves for nursing, joined Voluntary Aid Detachments, and worked in auxiliary hospitals. The raising of funds and making of comforts for the units of the original Expeditionary Force absorbed others, and the arrival of the Belgian refugees in England before the end of Aug. caused the formation of 2,500 local Belgian relief committees, of whom the members were mostly women. Clubs to help the wives of soldiers and sailors were started by the Tipperary League under Mrs. Juson Kerr, the British Women's Patriotic League, and others. The Women's United Services League under Lady French and Lady Jellicoe coördinated and registered the work done by war clubs throughout the kingdom. A large number of women devoted themselves at once to the work of the Soldiers' and Sailors' Families Associations, and to the work of the Officers' Families Fund founded by the Marchioness of Lansdowne in 1914.

Already in the early months of the war it became evident that the abnormal conditions arising from the quartering of large numbers of soldiers in barracks and camps, and of convalescents in hospitals, would give rise to social dangers, and that steps should be taken to deal with the situation. A militant suffrage society, the Women's Freedom League, formed the Women's Police Volunteers, under Miss Nina Boyle, in Sept. 1914. This Corps was reorganized shortly after as the Women Police Service under Miss Damer Dawson (d. 1920), and Miss Allen. To cope with the same evil the National Union of Women Workers called an emergency meeting of their rescue and preventive subcommittee in Sept. 1914. As a result a corps of "Women Patrols" was formed to work under the official sanction of the Commissioner of Police in the metropolitan district, and of the Chief Constables in the provinces (*see* Women Police).

I. *Voluntary Organizations and Corps.*—The first of the new corps of women called into existence to meet war conditions was the Women's Emergency Corps, originated by Miss Decima Moore, and launched Aug. 6 1914 in coöperation with Miss Lena Ashwell, the Hon. Evelina Haverfield, Miss Eva Moore and Mrs. Kingsley Tarpey. In addition to relief workrooms, and the registration of the innumerable voluntary offers of service characteristic of the first months of the war, schemes were started under its auspices which developed independently, after the parent corps had met the "emergency" conditions of dislocation of labour and refugee relief. The collection of surplus food from the London markets for the unemployed and for Belgian refugees developed into the National Food Fund, which raised £163,615 in gifts of food and money before the end of the war. The Women's Volunteer Reserve, founded in 1914 as a branch of the Women's Emergency Corps by the Hon. Evelina Haverfield, with the Marchioness of Londonderry as hon. colonel-in-chief, "to provide a trained and disciplined body of women ready to assist the State in any capacity," did military drill, wore khaki uniform and saluted their officers. The founders' idea that, as signalers, despatch riders, telegraphists and motorists, they might set men free for the firing line, was premature in 1914, but anticipated the need actually met later by the women of the Army Service Corps and Q.M.A.A.C. In practice the Reserve consisted of working girls who gave their leisure time to organized voluntary work in canteens, hospitals, workrooms and clubs. After Mrs. Haverfield had left the W.V.R. to work in Serbia with the Scottish Women's Hospitals, Mrs. Beatty and Mrs. Kilroy Kenyon formed the Women's Reserve Ambulance (Green Cross Corps) in June 1915, a fresh organization on somewhat similar lines to the W.V.R., but confining its activities mainly to London, whereas the most successful branches of the W.V.R. worked in the provinces till the end of the war. Other somewhat similar corps for the organization of part-time workers were the Women's Auxiliary Force, founded in 1915 by Miss Walthall and Miss Sparshatt, and the Liverpool Home Service Corps. The latter was started in May 1915 by Miss Phyllis Lovell and had branches throughout Lancashire. In Aug. 1915 it formed a Police Aid Detachment which worked in conjunction with the Lancashire police.

Public opinion with regard to the "khaki" women was reflected in a "Punch" cartoon for Dec. 15 1915, showing a gallant Highlander curtseying to take a lady officer's salute. They outlived this ridicule, and in 1918 the salute was officially adopted by the women of the Auxiliary Army Services. Nevertheless by the spring of 1915, when the country began to feel the drain of its man-power, the Marchioness of Londonderry realized that a less military corps of women would attract many of those anxious to come forward to carry on the work of the country. In July she founded the Women's Legion, which from the first was intended to be a corps of paid women replacing paid men. A khaki uniform was worn and the women were subject to regulations and discipline. Ultimately over 40,000 were enrolled. This corps was the link between the independent voluntary associations of women, such as the Emergency Corps, formed on the outbreak of war, and the official women's services, two of which (described below) were sections of the Women's Legion.

Throughout 1915 and 1916 efforts were made by voluntary organizations such as the Women's Legion and the Women's Defence Relief Corps, under Mrs. Dawson Scott, as well as by the Government, through the War Agricultural Committees of the Board of Trade, of which 63 had been set up before July 1916, to induce women to offer their services on the land and to persuade farmers to accept them. The Women's Farm and Garden Union was the most important of the bodies which had dealt with women's work on the land before the war, and, realizing that each individual woman was an object lesson for good or ill to the farmers whose favour had to be won, the Union started a system of training farms in the autumn of 1915. Early in 1916 the Government provided a grant, and the Women's National Land Service Corps under Mrs. Roland Wilkins was launched as a war off-shoot of the Farm and Garden Union, to deal with emergency war-work on the land. By the end of the year the demand for women had become greater than could be met by a small voluntary association, and, as the result of a deputation from the Corps to the Minister of Agriculture, the Women's Land Army was instituted early in 1917 as a Women's Branch of the Board of Agriculture. The Corps continued to act as the agent of the Land Army for organizing the supply of educated women as seasonal workers. In all 9,022 workers were sent out, and in 1918 the flax harvest was saved by 3,835 holiday workers from the Corps.

By the spring of 1915 shell-work for women was beginning; in March women tram conductors started work at Glasgow, and girls were employed as telegraph operators in Liverpool. But women were impatient at the slowness of the progress of industrial substitution and at the uselessness of the Women's War Service Register compiled by the Board of Trade in March 1915. The suffrage societies urged the Government to face the need for the recognition of the claim of women to be employed on war production, and in July 1915 a procession and deputation to Mr. Lloyd George was organized by Mrs. Pankhurst to assert this claim. In connexion with the demand for skilled workers, the London Society for Women's Suffrage, which promoted the introduction of women into occupations hitherto reserved for men, started a Munitions and Aircraft Department in July 1915, and arranged the first training classes in oxy-acetylene welding. The pupils were the first women welders to enter the engineering trade, and after two years the Ministry of Munitions assumed financial responsibility for the school.

Messrs. Beardmore in Glasgow and Messrs. Vickers at Barrow-in-Furness and at Erith employed women on shell-making in the spring of 1915. In order to ease the strain due to Sunday work, a band of Women Relief Munition Workers, educated women of the leisured class, were organized by Lady Cowan and Lady Moir and trained in the rough turning and boring of 4·5 shells and 18-lb. shrapnel at Erith; they bound themselves after training to undertake week-end shifts for six months.

In 1915 and 1916 work in canteens, hostels and clubs, formed by voluntary agency in connexion with the welfare of munition workers, absorbed a large number of voluntary women workers. Lady Lawrence obtained permission to enter the almost sacred precincts of Woolwich Arsenal in May 1915 and organized the Munition Workers Canteen Committee, which provided light refreshments at many munition factories and had 1,250 workers. The movement for establishing munition and dock workers canteens, essential for the health of the worker and the consequent output of munitions, dates from this initial effort. About 500 canteens for munition and dock workers were started by 12 voluntary societies:—the Munitions Auxiliary Committee of the Y.M.C.A.; the Y.W.C.A.; the Church Army; the Salvation Army; the Church of England Temperance Society; the National Peoples' Palaces Association; the Y.M.C.A., Scotland; the British Women's Temperance Association, Scotland; the Glasgow Union of Women Workers; the Women's Volunteer Reserve; and the Women's Legion. The latter employed 2,000 paid whole-time canteen workers, but it is estimated that over 10,000 voluntary part-time workers were in attendance at less than 130 out of the 500 canteens.

The Munitions Auxiliary Committee of the Y.M.C.A. under the presidency of Princess Helena Victoria opened 183 of these 500 canteens and had over 10,000 women workers. In all, between 35,000 and 40,000 women gave their services to the Y.M.C.A. in England during the war. The canteen work was undertaken to meet an emergency and to set the canteens going more quickly than would have been possible under any other system. But it was wasteful of voluntary labour, and in 1916 the Central Control Board became the responsible authority for the organization of industrial canteens in munition works throughout the country, and encouraged the employment of paid workers.

The steady withdrawal of men from civilian to military life led in 1916 and 1917 to a remarkable expansion in the scope and volume of women's work (*see* WOMEN'S EMPLOYMENT). The growth of the Women's Services, and the demand for women as substitutes for men in industrial occupations and in the Civil Service, caused a consequent diminution in the number of voluntary workers and in the relative importance of the voluntary corps.

II. *The Women's Services.*—The Women's Services were of two types. First came those composed of "enrolled" women in the legal sense, who were in the direct employment of the War Departments, and whose contracts brought them within the regulations of the Defence of the Realm Act. The women could be enrolled as "mobile" workers for home service only, or for service at home and abroad; or as "immobile" workers, recruited for local employment, who could not be required to move away from the district. Secondly came those composed of "non-enrolled" women in the legal sense, who did not render themselves liable to penalties under the Defence of the Realm Act and might be engaged on an annual or weekly contract. Some services enrolled their women for a year only and others for the duration of the war.

(A.) Enrolled Women

The Army Nursing Services.—Before the war the only women's auxiliary army services in existence were Queen Alexandra's Imperial Military Nursing Service and Reserve, and the Territorial Force Nursing Service. The V.A.D.s, founded in 1909 under the British Red Cross Society and Order of St. John of Jerusalem, developed a section of 12,000 V.A.D. nursing members, enrolled under the War Office in 1915 for service in military hospitals, and a section of 6,000 General Service members, enrolled for general service in connexion with military hospitals in 1917.

The Q.A.I.M.N.S. expanded from a corps of 800 trained nurses to 10,304; and the T.F.N.S. from 2,738 nurses ready to serve when war broke out to 8,140 (*see* NURSING).

The Military Massage Service.—The Military Massage Service started its career in Aug. 1914 under the name of the Almeric Paget Massage Corps. It was maintained by Mr. Almeric Paget (afterward Lord Queenborough) and Mrs. Almeric Paget (d. 1916), and consisted of 50 fully-trained masseuses who, early in Sept. 1914, were distributed among the principal military hospitals in the United Kingdom, this number being shortly increased to 100. Lady Essex French was hon. secretary.

The next development of the work of the Corps was in Nov. 1914, when a massage and electrical out-patient clinic was opened in London for the treatment of wounded officers and men, financed till Dec. 1920 by Mr. and Mrs. Paget. During the war over 200 patients were treated in the clinic daily. It was inspected by the Director-General Army Medical Service in March 1915 and subsequently became the model for the massage and electrical departments in the convalescent hospitals and command depôts throughout the United Kingdom. Early in 1915 the War Office officially recognized the Corps by making it the body to which all masseuses and masseurs engaged for service in military hospitals must belong. An advisory committee was instituted by the War Office, which laid down the standard of training and qualifications required and formed subcommittees to select the candidates. Thus the admission of untrained or partially trained personnel was prevented, and the interests of the patients and of the massage profession were safeguarded.

In Dec. 1916 the word "Military" was added to the title of the Corps, and in Jan. 1919 it became known as the Military Massage Service by Army Council Instruction.

It was not until Jan. 1917 that military masseuses were required for service overseas, but from that date up to six months after the signing of the Armistice 56 masseuses served in France and Italy; 3,388 masseuses and masseurs had been enrolled in the service and there were over 2,000 actually at work on the day the Armistice was signed. (The Regulations for the Corps are set out in A.C.I. 779, 1,262 and 1,146 of 1917, and 65,308 and 489 of 1919.)

The Women's Legion, Cooks and Motor-drivers.—In July 1915, a scheme was originated by the Marchioness of Londonderry, founder and president of the Women's Legion, which was approved by the Q.M.G., and put into operation at Dartford Camp convalescent hospital, for taking over the whole of the kitchens and installing women cooks. The objects were to release men for the work which women could do; to improve the cooking and cleaning of the camps and to introduce economies and variety in the feeding of the troops. The experiment proved a success; other camps were taken over, and an A.C.I. of Feb. 1916 defined the position of the cooks. The first Commandant was Miss Lilian Barker who, when she became welfare superintendent at Woolwich Arsenal, was succeeded by Dame Florence Leach. Mrs. Long, who lost her life in the torpedoing of the "Warilda," was hon. secretary. Ultimately 4,000 women cooks and waitresses replaced men in camps and convalescent hospitals in Great Britain; they signed a contract for a year, but were not enrolled until the organization became part of the Women's Army Auxiliary Corps in Sept. 1917. Those who transferred retained the right to wear the Women's Legion badge.

Women motor drivers, mechanics and storekeepers were first employed as substitutes for men of the R.A.S.C. in April 1916, and of the R.F.C. in the following September. The women were recruited and put into uniform by the Women's Legion under Miss Christobel Ellis, and were paid by the army. There was no enrolment until the Section was taken over by the W.A.A.C. in 1917.

This arrangement lasted only a few months, and in Nov., at the instigation of Lady Londonderry, the army abandoned the scheme for centralizing the administration of women working in the army in one corps, and it was decided that overseas drivers should enrol in the W.A.A.C., but that drivers for home service should again belong to the Motor Transport Section of the Women's Legion. They were enrolled for a year only, instead of for the duration of the war, as in the W.A.A.C., and came under the Q.M.G.'s Department; 647 Flying Corps drivers were transferred to the W.R.A.F. in 1918. Ultimately about 2,000 women were attached to areas and battalions throughout Great Britain, and after the Armistice several hundred drivers were sent to France to replace the demobilized mechanical transport men.

Women's Forage Corps, R.A.S.C.—In July 1915, women supervisors were enrolled under the War Office for the duration of the war to arrange for the transit of hay from the farm to the station and to forward it to its ultimate destination. The urgent need for increased substitution caused a special women's branch of the Forage Department, known as the Women's Forage Corps, to be inaugurated in March 1917 under Brig.-Gen. Morgan. Mrs. Athole Stewart was appointed superintendent and 4,200 women were enrolled as 1st. and 2nd.-grade officers and industrial members, for a year or the duration of the war. They were distributed throughout Great Britain and Ireland and wore khaki uniform. The industrial members took the place of privates in the R.A.S.C. and worked as hay balers, sack makers and menders, sheet repairers, thatchers, chaffing hands, transport drivers and clerks. The substitution of women did not depreciate the quality of the work.

Queen Mary's Army Auxiliary Corps.—In Dec. 1916 the War Office ordered Gen. Lawson to enquire into the number and physical categories of men employed out of the fighting area in France. On Jan. 16 he reported that in his opinion 12,100 men might be replaced by women to begin with. He added:—" In the last year or more in England the employment of women has developed to an immense extent through lack of men, and has been attended with remarkable success. Women have taken up various forms of male employment, which, by many, had been deemed impossible for the sex. They have found their way into work in all branches of life and have proved their capacity for it. In the army at home the success has been conspicuous and women are to be found working in numerous offices and cooking in many of the home military establishments. Results have shown that the sex difficulty has not been anything like what some have predicted. The women have been hard at work and felt they were out for the job and the men have respected them, and their experience at home has been, I understand, almost unanimous in this respect."

On Jan. 24 1917 the suggestion was put forward by Sir Nevil Macready, adjutant-general, that women employed in the army should be part of the army, entirely distinct from any outside organization and established in the War Office under his Department. This scheme materialized under the name of the Women's Army Auxiliary Corps, known popularly as " W.A.A.C.'s." Mrs. Chalmers Watson took up her duties as Chief Controller at Headquarters on Feb. 18 and Dame Helen Gwynne Vaughan as Chief Controller in France. Below the Chief Controllers were a staff of controllers and administrators, all women. A special branch of the War Office, known as A.G. 11, was formed to assist in getting the Corps into working order so that it could fit into the army machinery. A Women's Auxiliary Corps of the R.A.M.C. organized the medical boards in England and France, of which Dr. Jane Turnbull was president at home, and Dr. Laura Sandeman in France. At the end of a year Mrs. Chalmers Watson resigned for urgent family reasons, having accomplished the pioneer work of the Corps and won a recognized position in the army for her women in the face of many difficulties. She was succeeded by Dame Florence Leach, then known as " Controller in Chief." When Dame Helen Gwynne Vaughan was made Commandant of the W.R.A.F. in Sept. 1918, Miss L. Davy became Chief Controller in France. The full charter for the organization of the Corps was finally completed at the end of June 1917.

The women were enrolled as mobiles for home service only, or for home or foreign service, and for the duration of the war; they received a special rate of pay, not civilian or military, and were not enlisted under the Army Act. At first substitution overseas only had been contemplated, but by March the number of women recruited by the Department of National Service was so great that Home Commands were included in the scheme. Recruiting was afterwards carried on through the Employment Department of the Ministry of Labour. In Dec. 1917, owing to the shrinkage of available woman-power, an immobile branch was formed. Women employed in the Ordnance Army Pay Department and Record offices at home were not made to join the Corps. A khaki uniform with distinguishing badges was worn. In all there were 1,200 officials and 56,000 women, of whom 9,500 were the outside number employed in France at any one time. This figure was made up of women working in the Calais, Boulogne, Etaples, St. Omer, Abbeville, Dieppe, Rouen and Havre areas and on the lines of communication, chiefly at army schools, and in certain offices at G.H.Q. A number were employed with the Expeditionary Force canteens, mostly at officers' clubs. They were drafted to every type of office and domestic employment, and to bakeries, ordnance and motor transport depôts. In the spring of 1918, when the R.A.F. was formed, 7,000 women, including nearly the whole of the immobile branch of 1,800, transferred to the W.R.A.F.

When the American Expeditionary Force arrived in France and was prevented by shortage of transport from bringing over American women clerks, 500 members of the Corps under a Chief Controller, Miss Horniblow, who was succeeded by Miss Gordon and finally by Mrs. Vernon Lloyd as Deputy Controller, were transferred to the American camps at Bourges and Tours. Mrs. Vernon Lloyd was subsequently made Deputy Controller in Cologne, where over 100 Q.M.A.A.C. officials were employed with the army of the Rhine in the Censor's Department, under the provost marshal, and in ordnance. A small contingent was attached to the British military mission in Berlin for over a year. Queen Mary assumed the title of Commandant-in-Chief of the Corps in the spring of 1918.

A Q.M.A.A.C. unit attached to the Director-General of Graves Registration at St. Pol was in being in 1921.

Women's Royal Naval Service.—The W.R.N.S. was instituted as part of the navy at the end of Nov. 1917 when Sir Eric Geddes, the First Lord of the Admiralty, outlined what was required. The Director, Dame Katharine Furse, was asked to put up a scheme for the organization of the service, which was accepted with small amendments giving her more powers than she had set out. She had the opportunity of starting with a staff of women of considerable experience in organization and asked for Miss Edith Crowdy to be appointed as her deputy. The Director was the executive head, responsible only to the Second Sea Lord. No naval officer was available to assist her, and from the first the navy encouraged the greatest possible independence in the organization of the service. The formation of another service of women under the Air Board was already in contemplation, so that the W.R.N.S. (or Wrens) was from the first organized with a view to handing over all the members working in Royal Naval Air stations; 2,033 ratings were transferred to the administration of the W.R.A.F.

For the purpose of calculating allowances the following relative ranks were agreed to:—

W.R.N.S.	R.N.
Director	Rear Admiral
Deputy Director	Commodore (2nd class)
Assistant Director Medical Assistant Director	Captain
Deputy Assistant Director Divisional Director	Commander
Deputy Divisional Director Principal	Lt.-Commander
Deputy Principal	Lieutenant
Assistant Principal Quarters Supervisor	Sub-Lieutenant
Superintending Section Leader Chief Section Leader	Chief Petty Officer
Section Leader	Petty Officer
Leader	Leading Hand
Woman	Seaman

There were 12 Divisions: Devonport, Portsmouth, The Nore, Harwich, London, Humber, Tyneside, Scotland, Ireland, Liverpool, Cardiff and the Mediterranean. After the Armistice, stations were set up at Ostend and Zeebrugge under the Nore Division.

The ratings were enrolled for the duration of the war and paid on a civilian basis. Coöperation with the Employment Department of the Ministry of Labour on similar lines to that already set up in connexion with the Q.M.A.A.C. was arranged for the purpose of recruitment. As it is estimated that at the time when the W.R.N.S. was being formed over a million and a half additional women had already been drawn into industrial and commercial occupations, as munition workers and substitutes for men in the Forces, the recruiting up to the high standard required was made more difficult; but in spite of this excellent results were obtained. The service consisted of women living in hostels (mobiles) and of women living in their own homes (immobiles) in almost equal proportions. The women were largely recruited from naval families, and this contributed to the keen service spirit shown.

A total of 608 officers were appointed; 6,880 women were enrolled and 785 absorbed from women already employed in naval establishments, before the formation of the Wrens. On Nov. 21 1918, the date of maximum strength, there were 6,392 ranks and ratings.

The officers, other than those engaged in the organization, welfare and discipline of the women, replaced naval officers for the following work:—coding and decoding, intelligence work, confidential books, secretaries, telephone exchange, paymasters, accountants, gas mask work, and observation station. The ratings were employed as ledger clerks, clerks, shorthand typists, victualling store assistants, telephone operators, postal sorters, stewards, cooks, general domestic workers, orderlies and messengers, porters and storewomen, bakers, tailoresses, gas mask workers, gardeners, fitters, turners, boiler cleaners, boot cleaners and painters, wiring hands, net mine workers, depth charge workers, armourers, sailmakers, tracers and draughtswomen, photographic workers, technical storekeepers, valve testers and wireless telegraph operators.

Blue uniform with distinguishing badges was worn by all ranks and ratings. The service was demobilized in Dec. 1919.

The Women's Royal Air Force.—On April 1 1918 the R.A.F. was formed by the amalgamation of the R.F.C. and the R.N.A.S. Seven thousand women in Q.M.A.A.C. and 2,033 in the W.R.N.S. had been attached to R.F.C. units and to R.N.A.S. stations before the amalgamation. These were transferred to the W.R.A.F. and formed the nucleus of the service. The chief superintendent was Lady Gertrude Crawford, who was succeeded in May 1918 by Miss Violet Douglas Pennant as Commandant. Dame Helen Gwynne Vaughan, hitherto Chief Controller Q.M.A.A.C., France, was appointed Commandant in Sept. 1918. Mrs. Pratt Barlow was Deputy Commandant, and Miss K. Curlett Assistant Commandant over-seas.

Five hundred and sixty-six officers and 31,764 other ranks passed through the Service, the strength at the time of the Armistice being rather over 25,000. (The constitution and regulations were similar in outline to those of the Q.M.A.A.C. and the W.R.N.S.) The Service consisted of mobiles and immobiles in approximately equal proportions. In addition to the administrative, clerical and domestic work common to all the Services, the women were employed on meteorological work and as despatch riders, dopers, painters, acetylene welders, carpenters, magneto repairers, photographers and drivers. Fabric workers did duties of all kinds from the covering of aeroplane wings to the mending of the finest balloon silk. The uniform was first khaki, then blue, with the badges of the R.A.F.

The corresponding rank of officers and other ranks is shown below:

W.R.A.F.	R.A.F.
Commandant	Air Commodore
Deputy Commandant	Group Captain
Assistant Commandant Class 1	Wing Commander
" " " 2	Squadron Leader
Administrator	Flight Lieutenant
Deputy Administrator	Flying Officer
Assistant Administrator	Pilot Officer Observer Officer
Senior Leader	Warrant Officer 2
Chief Section Leader	Sergeant
Section Leader	Corporal
Member	Aircraft man

The medical arrangements for the W.R.A.F. were in the hands of Director of Medical Services R.A.F. under whom Dr. Laetitia Fairfield served as Woman Medical Director. A woman medical officer was on the medical staff of each of the R.A.F. Areas, and a medical woman was detailed for duty at each of the W.R.A.F. depôts and larger camps. They had hon. rank corresponding to that of the R.A.F. medical officers and by means of regular inspections and efficient care, preserved a high standard of health.

In March 1919 the first overseas draft embarked for service in France and 500 officers and other ranks formed part of the Air Force of Occupation on the Rhine. Demobilization took place March 31 1920.

In relation to the W.R.A.F. the experiment was tried of running a women's service as nearly as possible (having regard to the fact that the women were enrolled and not enlisted) as a part of the force to which it was attached. Thus correspondence was carried out through the usual Air Force channels; officers and other ranks of the W.R.A.F. were under the orders of senior R.A.F. officers; women officers were attached to the staff of the Air Officers commanding areas and were allowed to sign for them letters dealing with the W.R.A.F.; the officer in charge of W.R.A.F. inspection was a member of the staff of the Inspector General R.A.F. and the Commandant was stated in Air Ministry weekly orders to be on the staff of the Master General of Personnel and instructed to sign letters dealing with W.R.A.F. in the same way as directors and heads of independent branches; so that her correspondence, like theirs, carried the authority of the Air Council. The same principles were followed in the medical arrangements. By these means the need of a special section of R.A.F. officers dealing with the W.R.A.F. was obviated; economy was effected, and the administration of the W.R.A.F. was carried out on Air Force lines. The result was indicated by the terms of Air Ministry Weekly Order No. 1110 (promulgated Oct. 7 1920):

"In issuing orders for the final disbandment of the W.R.A.F. the Air Council desire at the same time to express their appreciation of the good work done by the Force both during and after the period of hostilities. In spite of much difficulty and in the face of hostile and unjust criticism, the W.R.A.F. has left a record of which it can well feel proud. During hostilities the good work it accomplished went far towards enabling the R.A.F. to reach that dominating position in the air which had such a direct influence in the achievement of the final Victory. Subsequent to the Armistice, when it was necessary to disperse a large number of airmen to civil life, it was the W.R.A.F. which made it possible for the R.A.F. to meet the demands made upon it, and maintained the services at the Aerodromes until new male personnel could be enrolled. The necessity for the demobilization of the W.R.A.F. is now imperative, but in returning to civil life, Commandant Dame Helen Gwynne Vaughan, D.B.E., Officers and Members may feel assured that they carry with them a debt of gratitude from the Nation."

(B.) NON-ENROLLED WOMEN

Anti-Gas Department.—On April 22 1915, at the battle of Ypres, the Germans first made use of poison-gas, and within 36 hours some sort of improvised mouth pad had been issued to every man in the line. Anti-gas work was begun at once, and men worked night and day to devise a really sound method of protection. Early in June 1915 Miss Beaver was appointed superintendent of the Camden Laundry Smoke Helmet Impregnating Station, where the work of drying and packing gas helmets had been largely carried on by members of the Women's Emergency Corps. When it was decided that gas helmets could be repaired for re-issue after use at the front, Miss Beaver and Miss Carey Morgan were sent out by the War Office to organize depôts for repair work with French labour at Abbeville and Calais. They were at once given the status of officers of the Army Ordnance Department, but were not actually gazetted till June 1916. They wore a nigger brown uniform with the badges and buttons of officers of the Army Ordnance Department. Six V.A.D.s were attached to the Abbeville depôt and four to Calais; they afterwards transferred to the W.A.A.C. as Administrators. The French depôts closed down when the "box respirators" had superseded the helmet types and the repair as well as the manufacture was carried out in England.

Practically the whole of the work on gas-mask manufacture was performed by women. There were 34 factories employing 12,000 under the immediate control of the Anti-Gas Department and 160 contractors employed a further 90,000 on work for the Department. In Aug. 1917 a number of educated women were trained for inspection work on the mask of the respirator and drafted out to the factories. They wore an indoor uniform of scarlet and were called "red-coats." Ultimately 800 to 1,000 of these were appointed, and 100 were promoted to the duties of check inspecting, formerly performed by sergeants of the Anti-Gas Department. They were known as sergeants also, and were interchangeable with the men. A few lady superintendents were appointed over "sergeants" and "red-coats," and Miss Carey Morgan was made officer in charge of the principal repair factory. In all about 50,000 respirators were issued.

Army Pay Corps.—The Army Pay Department was one of the earliest in the army to substitute female clerks. In July 1915, 479 were working and by Jan. 1 1916 there were 4,556 female clerks and 13 lady superintendents. The engagement was a weekly one and there was no form of contract till Aug. 1917. By that time the demands made for women by the W.A.A.C. and other organizations were so insistent that a form of agreement to serve for the duration of the war and three months afterwards was signed by the superintendents and a portion of the women doing skilled and semi-skilled work. These wore a badge but no uniform, and by March 1918 there were 5,171 of them out of a total of 17,500. Miss Constance Holmes, lady inspector, was responsible for the welfare of the women under Sir J. T. Carter, "Accounts 2," War Office, who was "at a loss to find words to adequately express his appreciation of the valuable work performed by the Women Clerks for the Army Pay Department during the war."

Army Remount Department.—Owing to the withdrawal of male personnel from Remount Depôts, women accustomed to hunting and to the superintendence of considerable stables of horses, were employed on remount work early in 1915. The first women's establishments were organized near Pangbourne by Mr. Cecil Alden, who worked on a contract basis for the War Office, employing what labour he chose. In 1915 he had 10 depôts for the stabling of 520 convalescent horses from veterinary hospitals in the vicinity of Aldershot, and half the depôts were staffed by women. They did the entire work from beginning to end, and horses were issued fit to units direct from their stables.

The next women's depôt was organized near Chester by Mrs. Rigby, and from these beginnings the employment of women spread until nearly 200 were working as grooms in 15 depôts directly under the Remount Department. The Charger depôt at Russley Park under Lady Birkbeck was the largest staffed entirely by women, and at Dr. Rimington's depôt near Chester women schooled horses rejected by their units as incurably vicious.

Navy and Army Canteen Board.—When the Navy and Army Canteen Board (then called the "Army Canteen Committee") started operations in April 1916, only 20 women clerks were employed. During 1917 the Board's activities were enormously expanded to include catering for the Imperial Overseas Forces and for the American and Allied Troops. It was decided in March 1917 to institute a N.A.C.B. Women's Corps in mobile and immobile sections, and by the date of the Armistice the women employed in connexion with canteen organization in the mobile corps numbered 10,000 and the clerical staff in the immobile corps 2,000. After the Armistice 500 members of the Q.M.A.A.C. and 8 officers were transferred to the N.A.C.B. Women's Corps to carry on the work in France during the dispersal of British troops, and 120 went with the army of occupation to Cologne. Although the women wore uniform and were under the orders of the chief superintendent working under the Department of the Controller of the N.A.C.B., they were not enrolled. The written agreement signed had no binding force and they could leave when they liked.

In addition to these groups of non-enrolled women in the direct employ of the War Departments, there were at the time of the Armistice 5,000 civil service clerks working on Army Records, 10,000 clerks employed by the War Office, and 17,500 miscellaneous industrial workers belonging to the Hospital Labour Staff, and the A.S.C.

Women's Land Army.—In Jan. 1917, a Women's Branch of the Food Production Department of the Board of Agriculture was set up under Dame Meriel Talbot as Director and Mrs. Alfred (Dame Edith) Lyttelton as Deputy Director. Two appeals were issued for the Branch by the Women's Section of the Department of National Service in March 1917; the first appeal to women to join a mobile Land Army on a year's enrolment ultimately secured 45,000 recruits, of whom half had to be rejected on medical and other grounds; the second appeal to village women for their part-time services, under the organization of group leaders and forewomen in the Land Army, gradually trebled the number of part-time workers already on the land.

Arrangements for recruitment were subsequently revised, and a scheme of coöperation between the three Departments concerned (viz. Board of Agriculture, Women's Branch, Ministry of National Service and the Employment Department, Ministry of Labour) was adopted early in 1918. Under this scheme women were given a choice of enrolling for a year or for six months, and arrangements were made with the Women's Forage Corps, R.A.S.C. and the Forestry Corps, Timber Supply Department, Board of Trade, for their recruits to be dealt with by the same machinery. With regard to Scotland a Scottish Women's Land Army was formed on somewhat parallel lines in which 1,816 women were enrolled. In addition 6,860 unenrolled women were placed in agricultural work. The employment of women as part-time workers was also stimulated and organized, and it is estimated that there were in Sept. 1918 300,000 women part-time workers and 16,000 whole-time workers actually engaged in agricultural work in England and Wales. This triumph, in the face of innumerable difficulties and at the cost of an elaborate and expensive organization, was due to the combined efforts of the Women's Branch at Headquarters, and the Women's War Agricultural Committees. These Committees set up in each county by the Board of Trade in 1915 and 1916 acted as its agents and conducted the local administration of the Land Army by means of the 13,000 women who served on them in a voluntary capacity. Between March 1917 and May 1919, 23,000 women passed through the training centres. Returns relating to 12,657 women made in Aug. 1918 show the distribution of the types of work done: 5,734 milkers, 293 tractor drivers, 3,971 field workers, 635 carters, 260 ploughmen, 84 thatchers, 21 shepherds.

The workmanlike and becoming uniform of overall, breeches and leggings contributed largely to the success of the Corps.

Special steps were taken to supply workers for seasonal work in connexion with the fruit crops, flax weeding and pulling and potato picking; coöperation was established by the Employment Department of the Ministry of Labour with the National Land Service Corps, who by arrangement with the Board of Agriculture undertook the supply of educated women for holiday work.

The work being done for food economy in the villages by the Women's Institutes (which had been founded in England in 1915 by the Agricultural Organization Society on the model of those in Canada) was so important that a special section of the Women's Branch of the Food Production Department was formed in 1917 to undertake their propaganda. These Institutes bid fair to become a permanent feature of country life, and owe much to the increased interest in rural matters due to the widespread employment of women on the land during the war.

Women's Forestry Service.—The Women's Forestry Service under Miss Rosamond Crowdy was instituted under the Timber Supply Department of the Board of Trade in 1917. In 1916 a considerable number of women had been employed by contractors in the cutting and measuring of timber, but it was not till early in 1917 that the first two Government camps for training women in the felling and preparation of timber for sleepers and pitprops were opened by the Women's Section of the Department of National Service, acting as agents for the Timber Supply Department of the Board of Trade. The first Government training camp for timber measurers was started in Aug. 1917 at Wendover under Mrs. Donald, through which 370 educated women passed. They learned to measure and mark off where a tree should be sawn and find the cubic contents of the logs, and were afterwards put in charge of timber gangs consisting of 20 to 30 cutters. In some cases women had the entire charge of a saw-mill with men working under them. The two camps for cutters were given up, as it was found that training was unnecessary when the women were put out to work in gangs under skilled forewomen. Private employers were supplied with 144 such gangs for felling, cross cutting, marking and measuring of timber between 1917 and 1919. About 3,000 women were engaged on the work, and wore an appropriate uniform with distinctive badges.

The King's Thanks.—On June 29 1918, an address of homage was presented to the King and Queen on the occasion of their silver wedding by the Chief Woman Inspector, Employment Department, Ministry of Labour acting on behalf of the organizations of full-time women workers engaged on work of national importance under the control of state departments, and of whole-time women workers engaged in public utility services under local authorities. A procession of 2,540 women in uniform led by the V.A.D.s as the senior service, formed into six companies, eight abreast, facing the dais in the quadrangle of Buckingham Palace. Princess Mary stood by the King and Queen wearing her V.A.D. uniform. The King's reply to the address of homage contained the following words:—

"When the history of our Country's share in the war is written no chapter will be more remarkable than that relating to the range and extent of women's participation. This service has been rendered only at the cost of much self-sacrifice and endurance. Women have readily worked for long hours and under trying conditions in our factories and elsewhere, to produce the supplies of munitions which were urgently needed at the front and to maintain the essential services of the country. As nurses and V.A.D. workers they have laboured in hospital for the care of the sick and wounded with even more than the accustomed devotion which has characterized our Red Cross Service since the days of the Crimean War. They have often faced cheerfully and courageously great risks both at home and overseas in carrying on their work, and the Women's Army has its own Roll of Honour of those who have lost their lives in the service of their country. Some even have fallen under the fire of the enemy. Of all these we think to-day with reverent pride."

Only the women actually belonging to the Army, Navy and Air Force took part in the Peace Procession. The W.R.N.S. marched with the Navy and Q.M.A.A.C. with the Army. The Army Nursing Services, the V.A.D.s, the F.A.N.Y., and the Military Massage Service formed part of the R.A.M.C. contingent; the Women's Legion and the Forage Corps marched with the R.A.S.C.; and the W.R.A.F., incorporated with the R.A.F., brought up the rear.

III. *Voluntary Organizations.*—When war broke out there was an eager desire on the part of professional and non-professional women to work in France and Belgium. The passport restrictions were less stringent at first than they afterwards became, but it was never easy for women to obtain permission to work in France in connexion with the British armies. The French and Belgians, who had fewer trained women workers of their own, and were in greater need of help at the beginning of the war, accepted offers from organizations which the British authorities had rejected. Thus the privilege of undertaking the considerable amount of work actually performed by women in connexion with the British armies, even before the formation of the Q.M.A.A.C., had been won with difficulty and was highly valued.

In 1914 Rachel, Countess of Dudley (d. 1920), Lady Sarah Wilson, the Duchess of Westminster, Lady Norman and Lady Hadfield established hospitals for the British at the bases in France in which every bed was of value in the early days of stress. After a few months the army took over Lady Dudley's hospital as No. 32 Stationary; the Duchess of Westminster's became No. 1 Red Cross and Lady Hadfield's No. 5 Red Cross. In 1916, the units of Millicent Duchess of Sutherland and of Lady Murray, which had previously been open for the French, were accepted for the British as No. 9 Red Cross and No. 10 Red Cross. These voluntary units were staffed with Red Cross and St. John's nurses, who were encouraged to enrol in the Army Nursing Services when they had obtained a knowledge of active service conditions. Nursing V.A.D.s were employed from the beginning in addition to hospital orderlies. Princess Louise's convalescent home for nursing sisters was opened at Hardelot in 1914 by Sophie Lady Gifford under the British Red Cross Society, and transferred to Cannes in 1917 as a winter home for the sisters.

On Aug. 12 1914 Dr. Garrett Anderson and Dr. Flora Murray offered the services of a hospital unit staffed by women doctors and nurses to the French wounded. Within a week the offer was accepted, and within a month the unit, which was the first formation to be entirely officered by medical women, had collected sufficient funds and started for Paris, under the name of the Women's Hospital Corps. Owing to the pressure of work in the north at the end of Oct. Dr. Garrett Anderson and Dr. Flora Murray decided to divide their staff and establish a branch of the unit at Wimereux. This new hospital was accepted by the British Army Medical Service. In Feb. 1915 Sir Alfred Keogh offered the Women's Hospital Corps the charge of a military hospital in London which opened at Endell Street in May.

In 1916 85 women doctors were attached as civil military practitioners to the R.A.M.C. at Malta to help care for the 27,000 wounded in the hospitals. As this experiment proved a great success, 39 others were sent with R.A.M.C. units to Salonika, and in Jan. 1918, the first medical women, of whom there were ultimately 36, went to Egypt. Four women doctors were attached to British military hospitals in France. They did not wear a distinctive uniform, and none of the 331 medical women who served under the War Office at home and abroad held military rank.

Women belonging to the Red Cross organization worked at the British Red Cross Society headquarters in France, recruiting Red

Cross nurses and tracing the wounded and missing. On Oct. 21 1914 the first V.A.D. unit, composed of 16 members and 2 trained nurses, under Dame Katharine Furse as officer in charge, arrived at Boulogne. On Oct. 26 they founded No. 1 V.A.D. rest station, Gare Centrale, Boulogne, in three French wagons and two passenger carriages and within 24 hours had given hot drinks to a thousand wounded from the first battle of Ypres. Under the Principal Commandant, Dame Rachel Crowdy, who succeeded Dame Katharine Furse in France, this work expanded in all directions until there were five rest stations for the feeding of patients on ambulance trains; two detention stations for the care of the personnel of veterinary hospitals and remount camps; six convalescent homes for nurses and W.A.A.C.s, and six motor convoys—all run and staffed by V.A.D.s. In Holland and Switzerland they were able to work for prisoners of war. In Salonika, Malta, Egypt and Italy they started kitchens attached to hospitals for the supply of invalid diets, and organized and staffed canteens for ambulance trains and convalescent homes for army nurses. In Italy they staffed motor convoys. At the beginning of the Gallipoli campaign two military hospitals went to Egypt without female personnel, on the assumption that they were destined for the peninsula, and had to depend on voluntary women helpers of all nationalities till trained nurses and V.A.D.s. could arrive.

Early in 1918 the British Section of the First Aid Nursing Yeomanry affiliated to the British Red Cross Society. This earliest women's military corps had been founded in 1909, and reorganized by Mrs. McDougall, in 1910, to assist the R.A.M.C. in time of war by providing mounted detachments with horse ambulance wagons, to take over wounded at clearing stations and convey them to base hospitals. When war broke out the services of the corps were offered to the British authorities without success, but were accepted by the Belgian army in Oct. 1914. With the ideal of working for the British always before her, Mrs. McDougall asked the War Office in July 1915 to reconsider the employment of women drivers of the F.A.N.Y. for driving motor ambulances at any British base. Although this was at first refused, renewed applications resulted in a F.A.N.Y. motor convoy starting work at Calais under Miss Franklin on Jan. 1 1916, for the transport of all British sick and wounded in the district. The F.A.N.Y. drivers were voluntary workers and supplied their own uniforms and traveling expenses; the Army gave rations; the British Red Cross Society kept up the ambulances, and in Aug. undertook complete financial responsibility in connexion with the cars. As a result of the success of this experiment, V.A.D. motor convoys were instituted in six other bases, and on Jan. 1 1918 the St. Omer convoy started work with 22 F.A.N.Y. drivers and 12 V.A.D. drivers under F.A.N.Y. officers. On May 18 1918 they worked through a particularly severe air raid and won 16 Military Medals in one night.

The great need for clubs where the army nurses and women workers could obtain rest and relaxation from hospital work was recognized by Princess Victoria early in 1915, when she formed a committee in London to finance such clubs at all hospital centres. The first was opened at Wimereux in Feb. 1915, and 10 others followed at Étaples, Camiers, Rouen, Le Tréport, Trouville, Calais, St. Omer, Abbeville and Paris. These clubs were a recognized unit under the administration of the Director-General Medical Services. In 1919 a club was also opened at Cologne. Lady Algernon Gordon-Lennox acted as Director in France and Germany.

The British army in France employed French labour for necessary industrial work such as the making of camouflage, repair of gas-masks and the salvage of clothing and war material. But in Jan. 1917 Messrs. Tarrants, who had a contract for building army huts, were allowed to send 100 trained women carpenters to Calais, where in collaboration with French female labour they made 37,000 huts. The women lived in a camp for two years under quasi-military discipline and were to a certain extent the prototype of the W.A.A.C.

On Nov. 4 1914 Lady Angela Forbes, who had a house at Étaples, started a free buffet for the wounded in the waiting-room of the Gare Maritime, Boulogne; this was the earliest of all the voluntary canteens provided for the British troops in France. In the following month Lady Mabelle Egerton opened her "Coffee Shop" at Rouen Station. From these individual efforts huts and canteens, maintained by authorized organizations, spread to every British camp in France. As time went on the authorities compelled the few privately conducted enterprises to affiliate to larger organizations. Lady Angela Forbes' original buffet became an Expeditionary Force canteen and her hut at Étaples was taken over by the Salvation Army; the Rouen Coffee Shop was affiliated to the Church Army in 1917; and in March 1918, by order of the Adjutant-General, only 10 voluntary organizations were authorized to work in the zone of the armies. These were the British Red Cross Society, the Y.M.C.A. and Y.W.C.A., the Salvation Army, the Church Army, the Scottish Churches Huts, the United Army and Navy Board, the Soldiers' Christian Association, the British Soldiers' Institute and the Wesleyan Soldiers' Institute. All these organizations had huts for men at the bases very largely staffed by women; but these were few in number compared to the huts and tents close behind the firing-line to which women could not go.

In Dec. 1914 Princess Helena Victoria formed the Ladies' Auxiliary Committee of the Y.M.C.A., to assist in providing recreation huts and reading-rooms for the troops in France and to send out concert parties. The Committee, under the chairmanship of Princess Helena Victoria, with the Countess of Bessborough (d. 1919) as hon. sec., selected the ladies to take charge of these huts, voluntary workers living at their own expense and signing on for four months' service. The work grew rapidly, until there were Y.M.C.A. huts, largely staffed by women, in all the bases in France, providing for the spiritual, material and educational needs of the men. Women workers were sent to Italy and Malta, and huts in Egypt and in Palestine as far north as Aleppo were also partly staffed by women. In 1918 the War Office gave permission for Y.M.C.A. huts to be opened in Holland for interned officers and men, and these were entirely staffed by the female relatives of the prisoners of war, a special fund being raised by the Association to pay the expenses of those who could not afford to travel and live at their own cost. Sixteen hostels for relatives of wounded in France were also staffed by women workers, of whom more than 1,860 passed through the Committee's hands for service abroad as canteen helpers, secretaries, librarians, motor-drivers, storekeepers, lecturers and teachers. In 1918–9 a certain number had their expenses paid, and the secretaries and motor-drivers received salaries.

The provision of entertainments was under the direction of Miss Lena Ashwell, the first concert being given at Harfleur on Feb. 8 1915; at one time there were 25 parties in France, giving concerts at the rate of 14,000 a year. In addition permanent concert parties worked continuously at 12 bases, and 6 theatrical parties were stationed at Paris, Havre, Abbeville, Dieppe and Étaples. Two concert parties went to Malta and a third to Egypt. £108,000 was raised for the work.

Although the hardships of camp conditions were ameliorated as much as possible for the W.A.A.C., the unaccustomed military discipline in a foreign country was trying in many ways, and the women badly needed the friendly help of an outside organization. In May 1917 Miss Ethel Knight of the Y.W.C.A. went to France under the auspices of the Y.M.C.A. to establish huts for them on the same lines as those which had proved so great a boon to the men. By the middle of 1918 there were 23 Blue Triangle huts in all the chief Q.M.A.A.C. camps, where the women could behave as though they were at home, and forget the discipline of army and camp life. Adjoining each there was a chapel or quiet room, but in the hut itself everything possible was done for the entertainment and recreation of the girls. Central clubs were also established in seven towns, and there was a rest-house at Le Tréport, a tea-garden at Havre and the Lady Carisbrooke marquee in the Q.M.A.A.C. rest camp.

Within 24 hours of the declaration of war Lady Bagot propounded her scheme that a hospital should be sent to the front manned and equipped by the Church Army. It was established at Caen under the French Red Cross. In Feb. 1915 the first of the Church Army recreation huts in France was opened at Rouen; these were staffed by voluntary workers, mostly women, who also paid their own expenses. About 500 altogether worked in Church Army huts in France and Germany.

A recreation hut for convalescent soldiers at the Colomn Camp, Boulogne, was opened by the Catholic Women's League under Mrs. Baynes in March 1915 and remained open until after the Armistice. Other huts in France followed. This was the only society which undertook concerted Catholic work on an organized plan during the war, though the Catholic Club, which had no organization or society behind it, maintained eight huts in the war zone staffed by 100 women and 18 men.

The Church of Scotland and the United Free Church of Scotland acted jointly, under the name of the Scottish Churches Huts, to carry on work similar to that of the Y.M.C.A. at the bases in France, up the line, in Malta and Egypt and in the Army of Occupation. The Salvation Army had a large organization to work among the troops, and women Salvationists laboured among Australian and American troops in huts in France, besides carrying on extensive hospital visitation and work amongst the homes of the bereaved in the United Kingdom.

The Women's Emergency Canteens, formed early in 1915 under Mrs. Wilkie with the idea of working for the French only, catered for the British also in the canteen opened at the Gare du Nord, Paris, in April 1915, which was a rendezvous for all Allied nationalities on leave. Early in 1917, when the Australians and Canadians visited Paris on leave in very large numbers, Miss Lily Butler opened a "Corner of Blighty," the pioneer leave club in Paris, to help them to spend their time as pleasantly and profitably as possible. Everything was given free of charge, and a staff of 45 voluntary women workers entertained 44,000 men in the first 10 months of the 2½ years for which the club was open.

Six months later the British Army and Navy Leave Club was opened and was the pioneer residential club in Paris for soldiers and sailors on leave. Baron D'Erlanger lent the house, and Miss Decima Moore and the Rev. A. S. V. Blunt were hon. secretaries. In the two years that it was open 59,102 men were registered and 701,546 meals were served. A body of uniformed Women Guides looked after the comfort of the men, and free entertainments on a large scale were organized.

As a result of the success of this club, the British Empire Leave Club at Cologne was originated and organized on the same lines by Miss Decima Moore, Hon. Director-General, who raised the funds with a London Committee under Baron D'Erlanger as chairman. Each department was conducted by a voluntary woman worker drawn from one of the proved women's war organizations, who wore the uniform of her society, and did her last piece of war-work for the British in an officially recognized institution opened at the invitation of the army.

IV. *Voluntary Work For Allies.—Scottish Women's Hospitals.*—On Aug. 12 1914 Dr. Elsie Inglis, president of the Scottish Federation of Women's Suffrage Societies, proposed that the Federation should equip a hospital "staffed entirely by women, if not required at home to be sent abroad." Within a week the War Office had declined the offer of a unit, and on Aug. 20 overtures were made to the embassies of Belgium, France and Russia. Mrs. Fawcett agreed that the N.U.W.S.S. should join in the appeal for funds, and by the end of the war £449,000 had been collected. In all, 14 different hospitals staffed entirely by women were mobilized and worked for the Belgian, French, Serbian and Russian armies. The first opportunity of service came when typhoid broke out in the Belgian army; on Dec. 5 1914 Dr. Alice Hutchison and Dr. Phillips, with 10 trained nurses, were put in charge of the typhoid annexe of Dr. de Page's hospital at Calais, where they worked for three months, until the epidemic had been overcome. On the same day the first complete unit under Dr. Ivens, consisting of 3 surgeons, 2 physicians, a radiologist, 10 trained nurses and as many dressers and orderlies, arrived in Paris on their way to the Abbaye de Royaumont, which had been allotted them by the French Red Cross. In this ancient edifice, founded by St. Louis, French wounded were tended by the Scottish women till Feb. 1919. An offshoot of the hospital, established at Villers-Cotterêts in huts in the spring of 1917, was evacuated before the German push on May 30 1918, being the last hospital in the district to remain at work. In both hospitals 10,861 patients were treated.

The Girton and Newnham unit worked uninterruptedly under the French War Office for four years. It went to Troyes in May 1915 with Dr. Louise McIlroy as C.M.O. and with Mrs. Harley (d. 1917) as administrator. As the hospital was entirely under canvas, it was ordered to accompany the French Expeditionary Force to Salonika in Oct. 1915, and went for a short time to Ghevgeli. The unit then settled down in Salonika for three years and opened an orthopædic department for disabled Serbian soldiers.

The remaining S.W.H. units worked for the Serbian army. The first went to Kragujevatz under Dr. Eleanor Soltau in Dec. 1914, and was the second British unit to arrive in Serbia in time for the typhus epidemic. With an equipment of 100 beds, Dr. Soltau had to take 250 patients immediately on arrival, and in March took charge of two fever hospitals as well. Three of the staff died of typhus. The next unit went out in May under Dr. Alice Hutchison to Valjevo, and was detained at Malta for a fortnight to look after British wounded from the Dardanelles, the one occasion on which a S.W.H. unit worked officially for the British army. By this time the typhus epidemic was over and a long peaceful summer intervened before the autumn invasion. The staffs of the two fever hospitals formed a camp hospital at Mladanovatz under Dr. McGregor, and Dr. Hollway with some sisters took over a Serbian hospital of 200 beds at Lazorovatz. Both these were evacuated at once when the storm of invasion broke out in Nov.; Dr. McGregor's party joined the great retreat through Albania; and Dr. Hutchison's party, with Dr. Inglis, who had come out to Serbia in May, remained working for the Serbs at Krushevatz, as prisoners of the enemy, from Nov. to Feb. 1916. The Austrians then sent them home.

In Aug. 1915 a party of Scottish women under Dr. Mary Blair had been sent to Serbia to reinforce Dr. Alice Hutchison's unit at Valjevo. As the invasion was pending they went to Salonika instead, to wait for work, and when it was decided that the Serbian civilian refugees were to accept the hospitality of the French Government at Corsica, this unit was invited to be in charge of the medical affairs of the colony. The hospital remained open at Ajaccio till April 1919 and treated 1,704 in-patients and 15,515 out-patients.

Among these were many of the Serbian soldiers who had accomplished the retreat through Albania, and after two months' rest were re-equipped to form a second Serbian army. A new S.W.H. unit, called the "America" unit, under Dr. Agnes Bennett, with a transport column under Mrs. Harley, was formed to accompany this army to Salonika. In Sept. 1916 they went to Ostrovo, to act as a casualty clearing station for the push to Monastir, and after the fall of the town a dressing station was opened at Dobreveni. The unit worked at Ostrovo till Nov. 1918, and then went to Vranja in Serbia, under Dr. Elmslie, till Oct. 1919, and coped with another typhus epidemic. Mrs. Harley, Gen. French's sister, left to do relief work in Jan. 1917, and was killed by a stray shell.

On her return from Serbia in Feb. 1916 Dr. Inglis spent six months in England trying in vain to obtain authority to take a unit to Mesopotamia for the British. Then the Serbian Government asked her to equip and maintain a field hospital, with a motor transport column attached, for service with the newly formed Serbian division, consisting of ex-Austrian subjects, who had allowed themselves to be made prisoners by the Russians and were attached to their army. The unit started in Aug. 1916 in charge of Dr. Inglis herself, with Mrs. Haverfield commanding the transport column, and went to the Dobrudja. They only had 19 days of work for the Serbs before becoming involved in the retreat of the Russian army, and while the Serb division was resting the unit worked for the Russian Red Cross. Once again they had to retire to Galatz, and then were helped by the British Armoured-Car Corps to get to Reni, where they were able to settle down for eight months and work for the Russians. An offshoot of the hospital under Dr. Chesney went to the Rumanian front. The Russian Revolution had meanwhile broken out, and the demoralization of the Russian army was so complete that Dr. Inglis was determined to prevent the Serb division from being sacrificed on that front in order to stiffen up the Russian *moral*. She sent two members of the unit to England to deliver a memorized message of 2,500 words to the Foreign Office, and, after pressure from the British Government, the Russians permitted the Serb division to go to Archangel, and the Admiralty sent transports to bring them to England. Although by that time Dr. Inglis was very ill, she insisted on waiting to return home with the Serb division, and as the first Admiralty transport was filled by the Russians with refugees, she had to wait for the second. They landed at Newcastle-on-Tyne on Sunday, and on Monday Nov. 27 1917 she died. The "Elsie Inglis" unit, equipped immediately after her death, left for Serbia in Feb. 1918, under Dr. Annette Benson, and worked at the first dressing station behind the lines during the Serbian offensive that preceded the Armistice. The transport column followed on the heels of the victorious army into Serbia.

Work for French and Belgian Armies.—At the beginning of the war the regulations affecting the entry of British subjects into France and Belgium were not strict, and as the British authorities discouraged voluntary offers, British organizations, individuals and groups of friends gave lavishly of funds, stores and the service of trained nurses to the French, Belgian and Serbian allies. Millicent Duchess of Sutherland had installed an ambulance of 8 trained nurses and a surgeon at Namur by Aug. 17, and by Aug. 24 they were all prisoners of the Germans. The British Red Cross Society sent out 12 parties of nurses to Belgium before the end of Sept., and 25 parties to different voluntary units in France before the end of the year, besides two parties to Serbia and one to Montenegro.

The second hospital unit to be officered by medical women only was organized by Mrs. St. Clair Stobart as administrator, under the name of the Women's Imperial Service Hospital, and left for Antwerp to work under the Belgian Red Cross Sept. 20 1914. It consisted of 6 doctors, 10 nurses and 10 orderlies under Miss Sally McNaughtan (d. 1916), who described the 14-days' work in *An Englishwoman's Diary of the War*. The wounded were evacuated just before the entry of the Germans. Within three weeks of their return the unit was re-formed and worked at Cherbourg until March 1915 under the French Red Cross.

Miss Sally McNaughtan had stayed behind at Ostend and joined the Hector Munro Ambulance Corps, a mixed body to which Miss May Sinclair, Lady Dorothie Feilding (the first woman to win the Military Medal), Mrs. Knocker and Miss Chisholm belonged. During this time of greatest hardship for the Belgian army the corps established a hospital at Furnes, to which ambulance drivers brought in wounded under fire. Early in 1915 Mrs. Knocker and Miss Chisholm left the corps and started a dressing station of their own at Pervyse, close to the Belgian lines, where they served the soldiers till both were badly gassed in their dug-out in April 1918. Miss Sally McNaughtan ran a portable soup kitchen for the Belgians in Furnes during the winter of 1914–5 and laid the seeds of the illness to which she succumbed in 1916. During this first winter of the war the Belgian army was in deplorable need of help, and Lady Bagot, who worked at Dunkirk in Nov. and Dec. 1914, dressing wounded at the station, raised funds to establish a transportable "Hospital of Friendship" at Adinkerke, which became the surgical section of the Hôpital d'Évacuation for the Belgian army. It was too close to the front for nurses to be allowed to work there, but Lady Bagot herself remained there for two years, before handing it over to the Belgian authorities. To meet the dearth of hospital requisites and clothing, Mrs. Bernard Allen started the Belgian Hospital Fund in Jan. 1915, which collected £25,000 in money and £25,000 in kind and aided 137 Belgian military hospitals and convalescent depôts in France and Belgium, and 30 colonies for refugee children, besides providing a club for soldiers, a recreation hut for the front, a hospice for refugees and 450 surgical outfits for regimental doctors.

During the battle of the Yser in Oct. 1914 the Belgian wounded poured into Calais, and Mrs. McDougall, of the First Aid Nursing Yeomanry, who had offered the services of the corps to the Belgian army, was asked to take over two old schools full of wounded as a hospital. There was no equipment, and the unit worked incredibly hard to produce a good military hospital out of nothing. The workers, with the exception of the trained nurses, paid all their expenses and subscribed to the hospital as well. From Nov. to Jan. 1915 they established a regimental aid post for the Belgians at Oostkerk, and during the height of the typhoid epidemic ran a convalescent home as an offshoot of the Lamarck hospital. The convalescent soldiers were drafted off in large numbers to the Camp de Ruchard near Tours, and there the F.A.N.Y. maintained a hut for them, with a canteen and cinema, and paid a trained nurse to look after the consumptives.

The motor-drivers originally belonging to the Lamarck hospital, who also conveyed the Belgian wounded from the clearing hospital to all the other hospitals in Calais, were officially attached to the Belgian Corps de Transport when the Lamarck hospital closed in Oct. 1916. This unit continued to drive for the Belgian army till after the Armistice and went with it to Bruges and Brussels. Belgian civilians who remained in the little strip of land not occupied by the enemy were in desperate plight too. King Albert's Civilian Hospital Fund was founded, by Mrs. Oliphant Murray and the Duchess of Buckingham and Chandos, to help Belgian state civilian hospitals abroad; the Belgian Canal Boat Fund, with Mrs. Agar Adamson as founder and Mrs. Innes Taylor as organizer in Belgium, fed and clothed 300 families in and about Furnes till June 1919; and the Belgian Front Relief Fund, under Miss Georgie Fyfe, evacuated 1,341 Belgian children from the war area into France and Switzerland, and repatriated them all at the end of the war, besides maintaining a maternity hospital at Vinckem for four years.

The work for the French was more extensive still. There were three Red Cross societies in France; the Société de Secours aux Blessés Militaires, the Association des Dames Françaises, and the Union des Femmes de France. As only the last named had a committee in London, a British Committee of the French Red Cross was called into being by the French ambassador towards the end of 1914, in order to allocate the services offered by British volunteers to the best advantage of all three societies. At the end of 1917 the Anglo-French Committee of the Joint War Committee, which had been formed in Jan. 1915 tc sift the credentials of British applicants for Red Cross work with the French, united with the British Committee. By this date 8,537 certificates had been granted to British volunteers for work in France. As the French army bore the brunt of the fighting for the first two years of the war their hospital problem was acute, especially as the nuns had left France before a sufficient number of nurses had been trained to replace them. To help fill the need, Miss Grace Ellison founded the French Flag Nursing Corps, which organized the supply of 250 British trained nurses, paid by the French Government, to help in the improvisation of the enormous number of French hospitals needed to cope with the rush of wounded. The Urgency Cases Hospital, a unit of first-class surgeons and 20 fully trained nurses, raised on the initiative of Miss Eden, hon. sec. of the National Union of Trained Nurses, went to Revigny in March 1915 to receive the worst cases on that section of the front. In July 1917 it was taken over by the British Committee of the French Red Cross. About 30 other units for the French were equipped by voluntary effort and staffed by British nurses and V.A.D.s, including Miss Bromley Martin's hospital at Arc-en-Barrois, the Johnston-Reckett unit at Ris-Orangis, Lady Sykes' hospital at Malo-les-Bains, the Michelham Foundation in Paris, the Ulster unit supported for two years by the Ulster Women's Unionist Council, the Martouret hospital and Ceret convalescent home of Mrs. Allhusen, the Sanatorium Beausoleil of Miss Lind-af-Hageby, Lady Eva Wemyss' hospital at Compiègne, Lady Guernsey's at Fécamp, Mrs. Symons' at Rimberlieu, Lady Tangye's at Paris Plage and others. In addition a large number of V.A.D.s worked in French hospitals and held positions of considerable responsibility.

The French Wounded Emergency Fund, which had branches throughout Great Britain for the making of comforts, was founded in Nov. 1914, with Miss Evelyn Wild as hon. sec., in order to give assistance to the French military and *bénévole* hospitals, as distinguished from the auxiliary hospitals run under the three French Red Cross societies. In May 1916, 2,755 French hospitals were classed as military, 1,552 as *bénévole* and 1,225 as auxiliary. By March 1918 the Fund had helped military hospitals in 1,200 different French towns, and £163,000 had been raised in money, and £75,000 in kind. Canteens were also established in many of the military hospitals. The French authorities placed a devastated sector on the Somme under the care of the Fund, and after the Armistice much work was done in the devastated areas.

On the closing of the Lamarck hospital at Calais the F.A.N.Y. transferred their personnel to staff a hospital for the French at Port à Binson, Marne, which opened in Jan. 1917. In the summer of 1917 the Corps began supplying ambulance units for the French army. There were finally three: S.S.Y.2, S.S.Y.4, and S.S.Y.5. The F.A.N.Y. officer commanding each unit held official rank in the French army as an officer. After the Armistice the S.S.Y.2 drivers were the first women to go into Germany with their ambulances to bring back prisoners of war. The Hackett-Lowther ambulance unit of women drivers under Miss Toupie-Lowther was attached to the second Army Corps of the 3rd French army in 1918 as S.S.Y.3. This was the only women's unit allowed to do front-line work; the cars were sent to the advanced "postes de secours," and the entire section was mentioned in despatches, which carried with it the right to have the Croix de Guerre painted on their ambulances. During 1919 the women's convoys did civilian relief work in the devastated areas.

The Women's Emergency Canteens, an independent Society under Mrs. Wilkie, and an offshoot of the Women's Emergency Corps, started a canteen at Compiègne in Feb. 1915 with a recreation room, which was the first of its kind. Another canteen was opened for four years at the Gare du Nord, Paris, with 60 beds attached, which was used by British and Allied soldiers, and all Belgians were fed free there for two years. Other smaller canteens were run for a time as offshoots of the one at Compiègne.

Canteen work under the "Oeuvre de la Goutte de Café" started by M. Duquesnoy early in the war, absorbed a very large number of British women workers, who were selected and sent out to France by the British Committee of the French Red Cross. The canteens were of four types, those at railway stations; those at *foyers de cantonnement* or recreation rooms attached to rest camps; those for the provision of invalid diets at *depôts d'éclopp*é*s*, and those at *depôts d'isolés* for men rejoining their regiments. The earliest railway canteen was opened at Hazebrouck in Feb. 1915, and moved to Doullens, where the work was very heavy during the Somme offensive; thousands of wounded from Gommecourt came through in a few days, and the helpers were sometimes working for 19 hours at a stretch. Many of the canteen workers had narrow escapes during the German push of 1918, when they had to evacuate suddenly with the Germans on their heels. A large number of the helpers were elderly women who worked extraordinarily hard, paid all their own expenses and faced all the hazards of war.

Work for the Serbian Army.—The first British women who worked for Serbia during the war left London with Madame Grouitch, the American wife of the Serbian minister at Nish, on Aug. 12 1914, and went to the Serbian 1st reserve hospital at Kragujevatz; the hospital material was exhausted in a few months, and it was as a result of the pitiful stories that reached home from this band of women that the Serbian Relief Fund was formed. Miss Flora Sandes and Miss Emily Simmonds, who belonged to the original party, raised a private fund, took out 108 tons of hospital material to Valievo in Jan. 1915, and nursed typhus in a Serbian hospital, doing operations and dressings for 12 hours a day, till both caught the disease.

The plight of Serbia during the first winter of the war, harried first by the Austrian invasion and then by the typhus epidemic, was so terrible that hospital after hospital was sent out from Great Britain by the Serbian Relief Fund, the British Red Cross Society, the Wounded Allies Relief Committee and the Scottish Women's Hospitals. All these took out trained nurses and many had women doctors, but, with the exception of the Scottish Women's Hospitals, the only two units under women administrators were financed by the Serbian Relief Fund. The first Serbian Relief Fund surgical unit under Lady Paget, the wife of Sir Ralph Paget, who became the British Commissioner for Serbia in 1915, reached the country in Nov. 1914 before any of the others, and did heroic service at Skoplje under appalling conditions. From Nov. to Jan. there was an unending stream of Austrian and Serbian wounded and in the second half of the month the typhus epidemic assumed serious proportions. Lady Paget, who had previously worked in Serbian hospitals in Belgrade during the Balkan wars of 1911 and 1912–3, organized a typhus colony in collaboration with the British Red Cross Society unit, for the isolation of the cases, which opened on March 1. Very few nurses could be spared from the surgical hospital, as over 90% of the staff were off duty for sickness between Nov. and February. Lady Paget herself, two sisters, two doctors, some Serbian voluntary assistants and Austrian prisoner orderlies coped with beds at the colony for 300 typhus patients. Between March 6 and 24 sixteen workers went down with the disease, including Lady Paget, and for a week one sister remained in charge of 300 patients. Then she was relieved by four nurses from the second Serbian Relief Fund unit (Lady Wimborne's). By May the epidemic was overcome and not a case left in the town.

Plenty of hospitals had arrived in the country by this time and, as there had been no fighting since Dec., the surgical units found themselves with little to do. Mrs. St. Clair Stobart, who commanded the 3rd Serbian Relief Fund unit, which was entirely staffed by women, landed in Serbia in April 1915, and at once began to utilize her medical personnel for the far greater needs of the civil population. She put up a wayside dispensary by the hospital camp, where 12,000 people were treated in a few weeks, and established six others in country districts during the summer. At the end of Sept. the Austrians, Germans and Bulgarians began massing on the frontiers and Mrs. Stobart was invited to accompany the Serbian army to the front with a part of her unit as a flying field hospital. They moved forward for a few days, but on Oct. 17 the great retreat of the Serbian nation began, and thousands of people trekked for three months over the Albanian mountains down to the sea at Scutari. Mrs. Stobart rode at the head of her column all the way, for 800 m., and brought it through intact.

Lady Paget with all her staff decided to remain with the hospital at Skoplje and allow themselves to be taken prisoners by the Bulgarians, in order to continue to care for the Serbian wounded of their own hospital and of the other hospitals abandoned by their staffs. She was allowed by the Bulgarians to distribute the hospital stores of food and clothing to all destitute refugees irrespective of nationality. Early in Dec. the Germans arrived, and in Feb. permission was given for the unit to leave the country. Lady Paget had accomplished the purpose for which she had stayed, having been able to superintend the distribution of all the stores and money.

Miss Flora Sandes, who was in England when the Bulgarians declared war, went back at once, and was officially attached to the ambulance of the 2nd Infantry Regiment. When the retreat began, the Commandant of the Division told her that her presence would encourage the soldiers; so, as the ambulance could not travel, she enlisted in the 2nd Infantry Regiment as a private and retreated through Albania with the Serbian army. When the army was re-formed she was promoted corporal, sergeant, and lieutenant, and went through every engagement with her regiment till she was wounded; she returned again to the front and was not demobilized till 1919. Whilst on active service, in coöperation with Mrs. Haverfield, she organized a Comforts Fund for the Serbian soldiers in the trenches, and raised money for the Sandes-Haverfield canteens, which worked directly under the Serbian army.

Work for the Russian Army.—In Sept. 1915 a British Committee, with Lady Muriel Paget as hon. sec., raised funds to equip an Anglo-Russian hospital for work under the Russian Red Cross Society. The hospital of 200 beds was formally opened in the palace of the Grand Duke Dmitri at Petrograd in Feb. 1916 in the presence of the Empress and a brilliant company. At the beginning of May, during the offensive of Gen. Brussilov a field hospital of 100 beds was attached to the Russian Guards, with a motor ambulance column of 22 ambulances; the Anglo-Russian hospital also took charge of 120 beds in a Russian hospital at Lutsk, providing the nurses and doctors. Over £100,000 was raised. Mrs. Wynne, an original member of the Hector Munro Ambulance Corps in Belgium, took a unit of motor ambulances to Russia in 1915, and was attached to the First Caucasian ambulance unit on the Persian front. The conditions proving too rough for her 50 H. P. cars, she transferred them to the column of the Anglo-Russian hospital. The Revolution put an end to the work, and Lady Muriel Paget and her staff had to travel home *via* Siberia and Japan, taking a month to cross Siberia in a third-class carriage.

The N.U.W.S.S. raised the Millicent Garrett Fawcett Maternity unit for work among the Russian refugees at a cost of over £12,000, and the Great Britain to Poland Fund, and the Polish War Victims Relief Committee worked as long as political circumstances permitted for the Polish refugees.

Work for the Italian Army.—Soon after Italy joined the Allies in May 1915, the British Committee in aid of the Italian wounded raised funds to finance the first unit of the British Red Cross Society in Italy, which arrived on the Isonzo front in Sept. 1915. A field hospital at Villa Trento, staffed by British sisters and V.A.D.s under the Joint War Committee, broke down the Italian rule against employing women nurses at the front.

In Dec. 1915 Lady Helena Gleichen and Mrs. Hollings, who had been trained as X-ray operators and had raised private funds to purchase motor-cars fitted with X-ray apparatus, were attached as a radiographic unit to the 6th Army Corps of the 3rd Army. The British Red Cross Society provided additional staff and cars. After six months they were attached to the headquarters staff of the 2nd Army and were present at both battles of Gorizia. Between Dec. 1915 and Oct. 1917, 12,600 X-ray examinations were made.

Mrs. Watkins, who raised her own funds for two years, and was helped by the British Red Cross Society, went to Italy in Sept. 1915 with a staff to set up station canteens for the hospital trains at Cervignano and San Giovanni Manzano, the railroads on the Isonzo front. In July 1917 she undertook the feeding of the wounded in the clearing station of Dolegna, and during Aug. an average of 1,600 wounded were dealt with in 24 hours. It was due to her initiative that the first recreation hut for soldiers of the 2nd and 3rd armies was opened by the Italian army in the spring of 1916. Mrs. Watkins and her helpers undertook the organization of 14 others, which proved so successful that the Supreme Command took up the idea and were building 100 huts just before the retreat of Oct. 1917. Mrs. Wynne, on her return from Russia, worked with her motor ambulances for the Italian Red Cross.

V. *Voluntary Effort in Supplies, Etc.*—The outbreak of war found voluntary effort for the fighting forces entirely unorganized, apart from the Regimental Associations in connexion with the regular battalions of the regiments comprising the pre-war army. The British Red Cross Society and Order of St. John were the only organizations that supplied hospital requisites for the sick and wounded. These could obviously not expand sufficiently fast to meet the new needs, and Queen Mary's Needlework Guild, with Lady Lawley as hon. sec., came into being on Aug. 10 1914, with the more general object of "organizing a collection of garments for those who will suffer on account of the war." The King and Queen and Princess Mary gave the lead in promoting funds to send a present for Christmas 1914 to every person wearing the King's uniform and to every nurse at the front, and Queen Alexandra presented each nurse in the regular army nursing services in France with a fur-lined cape, hood and muff.

It is estimated that the value of goods in kind presented to soldiers and sailors by voluntary effort in the first year of the war was £5,000,000, and funds were formed to collect in bulk such articles as air pillows, Christmas puddings, gloves, handkerchiefs, hot-water bottles, Bovril, letter cases, razors, respirators, "tubs for Tommies," periscopes, field glasses, wire cutters, sandbags, matches, cigarettes, tobacco, mouth organs, hospital bags, walking sticks and eggs. Some of these funds continued till the end of the war. The National Egg Society provided over 44,000,000 eggs for hospitals in four years. Lady Smith-Dorrien's Hospital Bag Fund distributed over 2,500,000 bags before Jan. 1 1918; Lady Roberts' Field Glass Fund produced on an average 300 field glasses a month; Miss Gladys Storey's Bovril Fund sent Bovril to all the fronts throughout the war; the Glove Waistcoat Society made 55,000 windproof waistcoats out of old gloves, and John Penoyre collected over 100,000 sweaters. By the sale of worn-out silver thimbles and oddments of silver and gold, the Silver Thimble Fund under Miss Hope Clarke raised over £60,000 and provided 15 motor ambulances, 5 motor hospital launches 2 motor dental surgery cars, besides large donations to the Red Cross and other funds for soldiers and sailors. The Vegetable Products Committee for naval supply under E. Jerome Dyer despatched 50,000,000 lb. of vegetables to the fleet, estimated in cash value at £1,250,000. Every town had its own fund to send parcels to prisoners of war, and the packing was done by voluntary women workers.

Outstanding private comforts funds were those started by Lady French and Lady Jellicoe, which closed down at the end of the first winter campaign, when the needs of the army and navy were for the moment satisfied. The one comforts fund inherited from the Boer war was Queen Alexandra's Field Force Fund, which opened in Oct. 1914, with Mrs. William Sclater, who had organized it in S. Africa, as hon. secretary. Gifts were sent out in response to definite requests from commanding officers, and by the Armistice over £80,000 had been raised.

The universal desire to make something for the man on active service caused a multitude of uncorrelated work parties to spring up all over the country, and it was clear that before the second winter campaign some general scheme of coördination was essential if the best use was to be made of the energy and enthusiasm of a vast band of voluntary needle workers. In Sept. 1915 the department of the Director-General of Voluntary Organizations, with Sir Edward Ward as Director General, was formed as a branch of the War Office, without funds, to establish county, city, borough, and district associations throughout Great Britain under which it was proposed to affiliate existing voluntary bodies. The organization dealt with supplies to combatants and to men in military hospitals. Regimental organizations were recommended to continue and extend their work, and the Joint War Committee and Queen Mary's Needlework Guild were recognized as separate and independent organizations.

From Aug. 10 1914 till Feb. 1919 St. James' Palace was the collecting centre for the 15,500,000 articles that were sent in by the members of Queen Mary's Needlework Guild all over the world. Six hundred and thirty branches with a membership of 1,078,839 persons were formed in Great Britain alone. The need for hospital dressings had been realized early and the first Surgical Branch Depôt was started by Miss McCaul in 1914, with Mrs. Gibson as general manager; this became the Central Surgical Depôt of the Guild, which sent 11,000,000 articles direct to Allied hospitals and hospital ships. The first orthopædic branch was the Surgical Requisites Association started at Mulberry Walk, Chelsea, which became the central orthopædic branch of Q.M.N.G. with 1,000 members and 44 branches. This depôt was a centre of instruction for all the institutions engaged in orthopædic work, owing to the inventions made by the workers. Elinor Hallé first utilized papier-mâché as a material for arm cradles, and then devised a light boot, with a papier-mâché back, for drop foot, which was in such great demand that centres were opened for making them throughout France and Italy as well as in Great Britain and India. A Papier-Mâché Surgical Appliances Department at Simla had 11 branches.

A process of making the papier-mâché waterproof for baths by using a cuprammonium solution of cotton wool instead of paste for the final layers of the papier-mâché, was invented by Miss Acheson. This medium was adapted for splints, and permission was obtained for voluntary workers to visit the military hospitals and take plaster casts from the limbs of the patients, on to which the splints were moulded, so that the utmost amount of pressure could be brought to bear without causing pain. This method of making splints for special cases became generally adopted by other depôts. Many elaborations of the splints were invented by Mrs. Sanyer Adkin; in the words of Sir Robert Jones, the department was an "inspiration."

The Red Cross and St. John's working parties were recognized as a distinct body under the Joint War Committee. They continued as before primarily to supply the auxiliary and voluntary hospitals, and sent their surplus to the military hospitals when asked to do so by the D.G.V.O. During the war 2,823 workparties were registered at the Central Workrooms at Burlington House, which were established in Oct. 1915 to coördinate the work. Over 30,000,000 articles were produced by the branches; 540,000 gifts were contributed by the 1,617 registered home workers, and 800,000 things were made by the 1,202 members of the Central Workrooms. The independent bodies of workers not belonging to Queen Mary's Needlework Guild or to the Joint War Committee were dealt with by the D.G.V.O., who invited the workparties to assemble their workers into groups covering certain areas under the Army Council's scheme. The comforts were issued to combatants through a "Comforts Pool" in each theatre of war, and to military hospitals according to the demands of the officers commanding hospital units. A total of 88,000,000 articles of clothing and surgical comforts estimated at a value of £5,000,000 were supplied to combatants, patients in military hospitals, allies and prisoners of war, by the 267 recognized head associations, composed of approximately 400,000 workers, grouped into 2,983 branches, all financially independent. These ranged from bodies of village women and shop girls to factories like the Belgravia War Hospital Supply Depôt and the Kensington War Hospital Supply Depôt; the latter with an average daily attendance of 1,200 workers turned out 6,000,000 articles, making a speciality of elaborate orthopædic appliances. A number of men did valuable work in the woodwork annexes of the depôts.

In addition to comforts made by hand the D.G.V.O. sent out 232,599,191 cigarettes, 256,487 lb. of tobacco and 62,193 games. The supply of books to the troops was in the hands of Dame Eva Anstruther, who had established the Camps Library in Oct. 1914 (afterwards affiliated to the D.G.V.O.) and despatched 16,000,000 books and magazines to fighting men. The War Library, run by Mrs. Gaskell and Dr. Hagbert Wright under the British Red Cross Society, furnished 6,000,000 books to the hospitals.

The provision of artificial teeth and dental treatment for soldiers and sailors was undertaken by the Soldiers and Sailors Dental Aid Fund under Miss Banister Fletcher. When it was founded in Dec. 1914 there was no arrangement for the supply of dentures to soldiers; but from March 1915 onwards the War Office gave a grant to meet the cost of treatment for their own men, and in Nov. took over the work. The Fund was reconstituted later under the name of the Ivory Cross, to provide treatment for discharged service men, for Home Army men and for the mercantile marine.

Ten thousand people, mostly women, worked in 1918 for the welfare of soldiers on leave in the London area alone, under the control of the General Officer Commanding the London District. In that year 3,068,135 men, 232,495 officers and 28,450 cadets were accommodated in rest houses in London. The Maple Leaf Club, the Victoria League Club and Peel House (started by Mrs. Moncrieffe and Mrs. Graham Murray) had been opened as residential clubs for the Overseas forces in the autumn of 1915, on the same lines as the Union Jack Club, founded as a memorial to the men who had lost their lives in the Boer War. Motor volunteer corps, such as the Motor Transport Volunteers, the Y.M.C.A. Baltic Night Transport, and the Women's Reserve Ambulance (Green Cross Corps) drove nearly a million men from station to station in 1918, and 8,000,000 men were fed at the free buffets at Victoria, Paddington, London Bridge, Liverpool Street, Euston, Waterloo and Charing Cross the same year. These buffets were maintained and staffed in night and day shifts entirely by women voluntary workers, and 12,000,000 men were fed during the war at Victoria station at a cost of £60,000. Similar buffets were organized at the big junctions in the provinces, such as Preston. It is impossible to estimate the additional number of women who worked throughout the country in canteens for soldiers in training and on home service.

Parallel with the supply of tangible comforts such as food and clothing went the provision of entertainment for men in camp and patients in hospital. The "Music in War Time" committees, subsidized in part as relief work for musicians by the Professional Classes War Relief Council, gave 15,000 concerts in hospitals and camps at home, 2,000,000 wounded soldiers being entertained in the Manchester area alone. Individuals and organizations such as the Y.M.C.A. at home, the Lena Ashwell concert parties at the front, the Three Arts Club and the Soldiers Entertainment Fund, did the same work.

The labour of the nursing staff in hospitals was lessened by the organizations which provided drives for the wounded, free bus rides and river trips, and arranged for the visitation of patients and the teaching of handicrafts. The friendships formed in hospital led to voluntary after-care work for the disabled. (For a list of funds, associations and societies for the assistance of service and ex-service officers, men, women, and their dependents, see 114/Gen. No. 6198, compiled by the secretary C.3 department, War Office.)

The Auctioneers and Estate Agents Institute of the United Kingdom bought the Star and Garter Hotel, Richmond Hill, as a home for the totally disabled in 1915 and presented it to Queen Mary; a sum of £224,000 for the building was raised by the British Women's Hospital Committee under the chairmanship of Dame May Whitty as a tribute from the women of the Empire.

VI. *Work for Belgian Refugees in Great Britain.*—In Aug. 1914 the gaze of the Allies was focussed upon Belgium, where one of the greatest tragedies of history was being enacted. After the first accounts of the German atrocities perpetrated at Visé and Liége, but before the extent of the German invasion of Belgium was foreseen, it occurred to Lady Lugard that a large number of Belgian women and children might be brought to the protection of English hospitality, by means of the organization recently improvised in Ulster for the removal of Irish women and children from the area which in July 1914 threatened to become a theatre of war. Preparations on these lines proceeded, with the coöperation of Ulster, the Catholic Church, the Foreign Office, the Local Government Board and the Belgian Government. Meanwhile the situation in Belgium was becoming more acute, and on Aug. 22 an official of the Exhibitions Branch of the Board of Trade, who was in Belgium on business, announced to Lady Lugard that he hoped to arrive from Ostend on the 24th with a transport carrying from 100 to 1,000 Belgians. Within two days the War Refugees Committee was formed to provide for them, mainly by the exertions of Lady Lugard and Mrs. Alfred Lyttelton. Lord Hugh Cecil became chairman and Viscount Gladstone treasurer. The response of the first appeal in the press brought offers of private hospitality for 100,000 persons, and not one of the refugees who poured into the country in an increasing stream was left without food, lodging and a warm welcome from the 500 volunteers who at first did the work. But the Committee was not rich in funds. A large proportion of the money, subscribed in England for the Belgians, went to the Belgian minister's fund for Belgian relief, which was earmarked to be spent upon the Continent. £106,500 was subscribed to the War Refugees Committee, and this had to be conserved for the expenses of organization, and for emergency relief. It was soon obvious that a national exodus could not be dealt with by private effort alone. In the House of Commons, on Sept. 9, Mr. (afterwards Sir) Herbert Samuel, then President of the Local Government Board, offered the hospitality of the British nation to Belgium, and from that day a department of the Local Government Board, under Sir Frederick Willis, worked in close relation with the War Refugees Committee. At first the Belgians had been received in refuges improvised by the War Refugees Committee; but it was then arranged that the Local Government Board should provide accommodation for the refugees in London and should superintend their reception at the ports and bear the cost of their transport. The War Refugees Committee was to allocate the refugees to private hospitality and organize the transport.

The Women's Emergency Corps had provided a body of interpreters to meet trains early in Aug. and did valuable work for the Belgians of the middle and upper classes who were able to pay their way temporarily. The greatest rush occurred during the week after the fall of Antwerp, when 26,000 refugees arrived at Folkestone and were welcomed by the local committee; 2,000 a day were dealt with in London by the allocation department of the War Refugees Committee under Dame Victoria Samuel (Mrs. Gilbert Samuel), and 6,000 a day by the transport department under Mr. H. Campbell. The occupation of Ostend by the Germans on Oct. 17 closed the Belgian coast, and all refugees arriving in England after that date came by way of Holland, and in far smaller numbers.

The early refugees had borne the first onslaught of German fury, and families arrived separated from each other and with no material possessions whatsoever. British women, protected from the same fate by the sea, and with few opportunities at that time of helping actively with other war work, poured out money and sympathy lavishly on the Belgians. By Jan. 1915, it was estimated that private hosts had spent £2,000,000 on hospitality. The central register of refugees compiled under the Registrar General's Department showed that 265,000 refugees arrived in England; they cost the Government approximately £3,500,000; but the total spent on them by private hosts and local committees was estimated in 1917 as at least £6,000,000. Over 6,000 Jews were cared for at the cost of the Jewish community in London. 2,500 local Belgian relief committees, of which about 1,500 were really effective, were formed in Great Britain, to which the refugees, after spending a few days at the Government refuges, were allocated by the 100 voluntary allocators of the War Refugees Committee; by the allocators at the office of the Belgian consulate, working in the same building; as well as by the Catholic Women's League and the Women's Emergency Corps. Four large refuges holding 8,000 persons, at Alexandra Palace, Earl's Court, Edmonton and Millfield House, were managed for the Local Government Board by the Metropolitan Asylums Board, and during the period of the greatest rush several boards of guardians lent other buildings. Edmonton and Earl's Court through which 100,000 refugees passed, remained open till the end of the war.

When the local relief committees, originally organized by the Earl of Lytton, had received their refugees from headquarters, they worked in complete independence. The Glasgow Corporation Belgian Refugee Committee under Mr. Alexander Walker acted as a central authority for receiving and distributing refugees all over Scotland. The Scotch committees raised £360,000. Liverpool, Manchester, Birmingham and Exeter, to mention only a few, looked after many thousands of refugees each. The university of Cambridge invited professors and students from the four Belgian universities to come into residence and organized lectures for them and hospitality for their families. The Chelsea Committee, with Mrs. Erskine Childers as hon. sec., started industries for the refugees on a large scale, and spent £72,000 of English and American money. The National Food Fund and the Belgian Refugee Food Fund, with the substantial assistance of the Smithfield Markets Belgian Relief Fund (which divided gifts of meat between the two funds), supplied an allowance of free food to hostels and Belgian households in London; this made it possible for a large number to do without other financial assistance.

In Jan. 1915, owing to the natural drying up of the sources of private hospitality, the Government undertook to make grants in aid to refugees when private offers were not available, and in this way wholly or partially maintained an average of 6,500 persons till May 1919. In Nov. 1915 it took over the cost of the staff of the War Refugees Committee. When this organization took definite shape, it consisted of a staff of 400 paid workers, who by degrees assumed the places of the original volunteers, though some of these continued to give their services till the end of the war. Lord Gladstone was chairman of the managing committee and Mr. Algernon Maudsley, who had assisted the committee from the earliest days of the war, hon. secretary. The health department, which made provision for chronic, maternity, convalescent and dental cases all over the country, was organized by the Countess of Sandwich in Oct. 1914 and afterwards by Dame Victoria Samuel. Viscountess Gladstone was at first in charge of the education department, and Mrs. Alfred Lyttelton of hostels and flats for the use of refugees passing through London. Mrs. Henn Collins and Mrs. A. S. Webbe looked after undesirables and organized rescue work.

In the first months of the war, owing to unemployment at home and to the feeling that the Belgians might soon be able to return to their own country, the refugees were discouraged from seeking paid work. But when this policy was reversed, it became the chief duty of the relief committees to help their guests to find employment. During 1915 factories for the manufacture of war material, established by the initiative of the Belgians themselves, were staffed with Belgian labour, and 65,000 refugees obtained work through the labour exchanges. Ultimately, nearly all the refugees, except those of the professional classes, were absorbed into the economic life of the country. This did not mean that they were all entirely self-supporting, owing to the high rent of furnished rooms and to the difficulties besetting exiles in a foreign country. Lady Lugard's hospitality committee and the Duchess of Somerset's housing committee established hostels for the propertied and professional classes, where the Government allowance was supplemented by a private fund. A scheme for assistance with the rent of furnished flats in London on a large scale, devised by Mrs. Alfred Lyttelton, proved an immense boon to all classes of refugees.

In the first week of Oct. 1914, the Wounded Allies Relief Committee organized the transportation of the first wounded soldiers from Belgian hospitals to England. Auxiliary V.A.D. hospitals, mobilized, but not at the time needed for the British, opened with enthusiasm to receive the Belgians. 40,000 wounded soldiers came to England, many to return shortly to the front. The first of the five King Albert military hospitals, established in England by the Belgian Government, opened at Highgate in Dec. 1914. By degrees the seriously wounded were concentrated in this hospital, which remained open till 1919, and the discharged drafted to a Belgian reëducation camp in France.

Owing to the large number of refugees in England, the Belgian soldier at the front had to be helped to spend his leave with his relatives. The Local Government Board, from Jan. 1916 onwards, bore the expenses of his journey; a special channel service transporting 300 men a day was organized; the transport department of the War Refugees Committee under Mr. H. Campbell arranged the distribution of 185,000 men to their families, and the British Club for Belgian Soldiers was opened from voluntary sources as a residential club for men without friends or relatives.

Gradually much help was organized for their compatriots by the refugees themselves. A "Union de Comités" under M. Émile Vandervelde, Ministre de l'Intendance de l'Armée Belge, which had its headquarters in London, coördinated the work of approximately 20 Belgian funds chiefly for Belgian soldiers. Mme. Edmond Carton de Wiart, Mme. Maton, wife of the Belgian military attaché in London, and Mme. Pollet, wife of the consul-general for Belgium, took a prominent part in the charitable activities of the Belgian community.

During four and a half years of exile the Belgians grew to feel at home in a strange land, and when the time for repatriation came, many were loth to go. The expenses of repatriation were borne by the British Government at a cost of £243,000 and in Oct. 1920 a monument was erected on the Thames Embankment from a fund raised by the ex-refugees themselves, in memory of their exile in Great Britain during the war. (A. E. C.)

UNITED STATES

When the United States entered the World War in April 1917, but one organization depending mainly on the efforts of women was officially recognized by the Government: the Red Cross. On May 6 1917 the Red Cross had 562 chapters with a membership of 486,194. At the signing of the Armistice, it had more than 3,500 chapters and upwards of 8,000,000 regular volunteer women workers. These women produced in 20 months over 371,000,000 relief articles, including surgical dressings, garments for the wounded and the refugees, and a variety of comforts and conveniences for soldiers and sailors. The value of their output was about $94,000,000. The Red Cross enrolled during the war 23,822 women as nurses. They served in the military and naval hospitals in the United States, Europe, and the Near East, as well as in convalescent homes for soldiers and sailors and in relief work for adults and children both in the United States and overseas. They worked in 700 Red Cross canteens in the United States and 130 in France, serving refreshments to moving troops, giving them medical care, transferring them when sick, and in other ways aiding and cheering them.

When war was declared many large national organizations of women applied to the Government for instructions. The Council of National Defense appointed at the end of April 1917 a committee of nine women (afterwards increased to eleven) with Dr. Anna Howard Shaw as chairman, to form a plan by which the women of the country could be utilized. This committee selected a woman in each state as a temporary chairman, requesting her to call together the heads of all national organizations of women in her territory to elect permanent officers for a state division. This state division was in turn to organize county committees and each county was to form a division in each city and town. This work of organization was carried on so rapidly that by Dec. 1917 the county organization was complete in 23 states, and a year later there were county chairmen in more than 80% of all the counties in the country. Seventy-three different national organizations of women coöperated. Through these divisions it was possible to convey at once to practically all of the women of the nation the requests of the Government.

The plan of work which the women's committee laid out included the following departments: (1) registration for service, (2) food production and home economics, (3) food administration, (4) women in industry, (5) child welfare, (6) maintenance of existing social service agencies, (7) health and recreation, (8) educational propaganda, (9) Liberty Loan work, (10) home and foreign relief. The specific tasks for these departments originated either in requests or suggestions of the Government or in plans made by the committee itself and approved by the Government. Two months after the women's committee was created it was requested by the Government to enrol the women of the country in a league to support such plans for food conservation as the food administration might present. In a few weeks 5,223,850 pledge cards were signed. The signers were the nucleus of a women's food army which, throughout the war, responded to every request for the conservation, substitution or production of foods made by the food administration. Throughout the war, the women's committee continued to serve the Government in similar drives. For some months the committee gave active assistance to the national women's Liberty Loan Committee created by the Secretary of the Treasury, and in 1918, at the request of the agencies responsible for furnishing nurses to the army, including the Red Cross, and the surgeon-general's office undertook a campaign to enrol students for the U.S. student nurses' reserve. While 5,000 student nurses had been asked for, 13,880 were enrolled, and by the end of Dec. of that year 7,730 of these had been placed for training.

The National League for Women's Service, an organization formed after a study of the activities of Englishwomen, some weeks before the United States went into the war, developed an extensive motor corps, carried on a variety of services to soldiers and sailors, and effectively supported all drives. The Y.W.C.A. organized in June 1917 a war council, under which it developed a variety of service clubs, both in the United States and overseas, particularly France. The hostess houses of the association at the home camps of both white and coloured soldiers looked after women visitors, a service which proved of such value that the War Department at the close of the war took the work under its educational and recreational branch. Some 50 buildings were turned over to the Government by the war works council of the Y.W.C.A. Overseas the association conducted service clubs which served Red Cross nurses and other women workers. Both in France and in the United States this organization carried on industrial service clubs near large manufacturing centres.

The employment of women in war industries began in the United States in the winter of 1914–5 with the manufacture of supplies for the Allies. The percentage of women to men in the 19 leading war industries increased from 6·5% in 1914 to 7·7% in the latter part of 1916. In the next two years, to the close of 1918, the proportion rose in these industries to 13·9 per cent. A conservative estimate places the number of women employed in factories (food, textile and war supplies) by the end of 1918 at 2,139,100—an increase of between five and six hundred thousand over the number employed in these industries in 1914, the date of the last official census. These women were trained to perform a variety of skilled and semi-skilled tasks in the metal trades, in electrical and chemical occupations, in the making of fine instruments, in wood, rubber and leather work, all trades which had been considered beyond their capacity. The substitution of women for men on street railways and subways, in railway yards, banks, offices, shops and hotels and in agricultural pursuits, increased steadily until the signing of the Armistice.

This invasion of industry and commerce by women was accompanied by an effort to preserve existing legal safeguards and to ensure suitable living and working conditions. In 1918 Congress established a women's bureau in the Department of Labor, the aim of which was to develop the most effective use of women's service in production for the war, and at the same time to prevent their employment under injurious conditions. The bureau adopted a set of standards governing women's employment. Although created for the war emergency, the woman's bureau in June 1920 was made a permanent section of the Department of Labor.

No official nation-wide registration of women for war service was ever made; plans for such registration were completed by the women's committee of the Council of National Defense and approved by the Government, and it was left to each state to decide whether or not there was a need for registration in its territory. But it is a fact that practically all the women of the United States were doing volunteer war service at the time of the Armistice. They served in the food army, in the farm army, in the chapters of the Red Cross, in the many drives for funds, and in many other less conspicuous but essential activities backed by the Government.

(I. M. T.)

WOOD, SIR HENRY EVELYN (1838–1919), British field-marshal (*see* 28.789). The field-marshal, who retained his mental and bodily vigour almost to the end, died at his Essex home Dec. 2 1919 and was buried at Aldershot. His record in Zululand indicated unmistakable capacity for command in presence of the enemy, and he was perhaps unfortunate in that his presence during the hostilities with the Boers in 1881 and at Alexandria in 1882 afforded him no further opportunities of a similar kind. From the period when he was chief at Aldershot dates the introduction of military training on practical lines into the British army, and during a prolonged and distinguished career as a soldier he proved himself a keen reformer and an untiring worker, wrapped up in the profession which he adorned.

WOOD, SIR HENRY JOSEPH (1869–), English conductor and musician, was born in London March 3 1869. His musical education was largely received at the Royal Academy of Music and when only ten years old he became deputy organist at St. Mary's, Aldermanbury. As a conductor, he first appeared in 1889, when he joined the Rousbey opera company, and for some years he toured with various companies, including the Carl Rosa (1891). In 1895 the Queen's Hall concerts were started under a system of guarantees, with Henry Wood as conductor and Robert Newman as manager. Under his conductorship the standard of English orchestral playing was notably raised, and his work for music in London was deservedly honoured by a knighthood in 1911. He married, first, in 1898, a Russian lady, Princess Olga Ourousoff (d. 1909); second, in 1911, Muriel, daughter of Major Greatrex.

WOOD, MRS. JOHN [Matilda Charlotte] (1833–1915), English actress, was born at Liverpool Nov. 6 1833, the daughter of Henry Vining, and first appeared on the stage at Brighton at the age of eight. As a young girl she played leading parts in comedy at the Theatre Royal, Manchester, and in 1852 appeared there as Ophelia. After her marriage she acted for some years in America, beginning in 1854 with *The Loan of a Lover*, followed by many other parts. She opened a theatre of her own in New York in 1863 but returned to England in 1866. From that time until her retirement from the stage in 1905, she was in the first rank of robust comedy actresses. Her management of the Court theatre between 1883 and 1891 saw the production of many of Pinero's best comedies. Later she appeared in elderly rôles in most of the Drury Lane melodramas, her last appearance being in Hall Caine's *The Prodigal Son* in 1905. She died at Birchington-on-Sea Jan. 11 1915.

WOOD, LEONARD (1860–), American soldier, was born at Winchester, N.H., Oct. 9 1860. He graduated from the Harvard Medical School in 1884, was appointed assistant surgeon with the rank of first-lieutenant in the U.S. army in 1886, and at once joined Capt. Lawton's expedition against the Apaches in the southwest, resulting in the capture of Geronimo. For distinguished services he was awarded the Congressional Medal of Honor. In 1891 he was promoted captain and full surgeon, and later, while stationed in Washington, D.C., was President McKinley's personal physician. Here he became the close friend of Theodore Roosevelt, then Assistant-Secretary of the Navy. On the outbreak of the Spanish American War in 1898 Wood was commissioned colonel of volunteers, and together with Roosevelt, as lieutenant-colonel, raised the famous regiment of "Rough Riders," composed of western ranchmen and cowboys as well as members of prominent eastern families eager to serve under these two strenuous leaders. For conduct at Las Guasimas and San Juan Hill, Wood was promoted brigadier-general July 1898 and in Dec. major-general of volunteers. He was military governor of Cuba from 1899 to 1902 when the Cuban Republic was established. Under his guidance great improvements were made in schools and sanitation. Meanwhile he had been honourably discharged from voluntary service and appointed brigadier-general in the regular army Feb. 1901. In March 1903 he was sent to the Philippines and in Aug. promoted major-general. For three years he was governor of the Moro Province and during 1906–8 was commander of the Philippines Division. In 1908 he returned to America as commander of the Eastern Department for a year. In 1910 he was special American ambassador to the centenary celebration of Argentine independence. On his return he was appointed chief of staff, serving until 1914, when he was again given command of the Eastern Department. General Wood often had disapproved the policies of the War Department, and as early as 1908 had urged preparedness. To him was largely due the establishment of a summer camp at Plattsburg for training civilian officers, which was taken as a model for other camps of the kind after America's entrance into the World War. In 1915, when he gave unofficial indorsement to the proposed formation of the American Legion whose purpose was to establish a body of some 300,000 men ready for immediate service, he was rebuked by the Secretary of War. Just before America's entrance into the World War in 1917 it was announced that the Eastern Division, then under Gen. Wood's command, had been divided into three divisions, and Gen. Wood was assigned to the Southeastern Division, with the alternative of choosing either Hawaii or the Philippines. As a soldier desiring active service he naturally chose the American post; but the apparent motive of the War Department to humiliate him aroused criticism. He was later transferred to Camp Funston, where he trained the 89th Div., N.A. In Jan. 1918, while in France, presumably preparatory to bringing his troops there, he was painfully wounded by the explosion of a French mortar. After his return to America he was on the point of embarking with the 89th Div., when he was suddenly assigned to the Western Department, no reason being given. It was generally understood that his name was not on the list of officers submitted by Gen. Pershing as acceptable for duty overseas. By change of orders he was returned to Camp Funston, where he trained the 10th Div. of the regular army and other troops. In 1919 he was put in command of the Central Department, with headquarters at Chicago. In 1920 he was a prominent candidate for the presidential nomination at the Republican National Convention. He led on the first four ballots and never fell below second place. When the supporters of Governor Lowden, his chief competitor, were released after the eighth ballot, they swung to Senator Harding, a "dark horse," who was nominated on the tenth ballot, with 692½ votes to 156 for Gen. Wood. In 1921 Gen. Wood was sent on a special Federal mission to the Philippine Is. to report on conditions there. During his absence he was appointed head of the university of Pennsylvania. In Oct. 1921 he retired from active service in the army and was appointed governor-general of the Philippines. He was granted a year's leave of absence from the university of Pennsylvania, but it was thought that he might be able to assume his academic duties in Oct. 1922. He was the author of *The Military Obligation of Citizenship* (1915, lectures at Princeton and elsewhere); *Our Military History, Its Facts and Fallacies* (1916); and *Universal Military Training* (1917).

See I. F. Marcosson, *Leonard Wood, Prophet of Preparedness* (1917); Joseph H. Sears, *The Career of Leonard Wood* (1919); and *Leonard Wood on National Issues* (1920), compiled by Evan J. David.

WOODGATE, WALTER BRADFORD (1841–1920), British oarsman and barrister, was born at Belbroughton, Worc., Sept. 20 1841. He was the eldest son of Canon Henry Arthur Woodgate, who was a fellow of St. John's College, Oxford, and Bampton lecturer in 1838. He was educated at Radley College, and Brasenose College, Oxford, and during his undergraduate course he founded Vincents' Club. In 1872 he was called to the bar; but it is as a first-class oarsman and journalistic critic of rowing that he is remembered. He rowed for his own college, and in 1862 and 1863 in the winning eight for Oxford. In 1864 he won the Diamond sculls after a dead heat two years previously (*see* 23.784), and in 1865 he was in the winning eight for the Grand Challenge Cup at Henley. He contributed the volume on *Boating* to the Badminton Library, and also wrote *Oars and Sculls, and how to use them* (1889) and the *Reminiscences of an Old Sportsman* (1909). He was also the author of *A Modern Layman's Faith* (1893) and of one or two novels. He died at Southampton Nov. 1 1920.

WOODS, HENRY GEORGE (1842–1915), English divine, was born at Woodend, Northants., June 16 1842. He was educated at Lancing and at Corpus Christi College, Oxford, where he had a distinguished career. In 1865 he became a fellow of Trinity, and in 1866 was ordained. He was a tutor at Trinity from 1866 to 1880, and bursar from 1867 to 1887, in which year he was elected president of Trinity. He resigned the presidency of Trinity in 1897, and from 1900 to 1904 was rector of Little Gaddesden, Herts, and chaplain and librarian to Lord Brownlow at Ashridge Park. In 1905 he succeeded Ainger as Master of the Temple. He died at the Master's House, Temple, July 19 1915.

His wife, MARGARET LOUISA WOODS (b. Nov. 20 1856), poet and novelist, was married to him in 1879. Her first novel, *A Village Tragedy*, appeared in 1887, and her first volume of verse, *Lyrics and Ballads*, in 1889. Later novels included *Esther Vanhomrigh* (1891); *The Vagabonds* (1894); *Sons of the Sword* (1901), and *The Invader* (1907). In *The Princess of Hanover* (1902) she essayed historical drama. In 1913 her *Collected Poems* were published.

WOODWARD, HENRY (1832–1921), English geologist (*see* 28.804), died at Bushey, Herts, Sept. 6 1921.

WOODWARD, HORACE BOLINGBROKE (1848–1914), English geologist (*see* 28.804), died Feb. 5 1914.

WOOL (*see* 28.805).—The functions of "supply" and "demand," of "free-trade" and "controlled trade" in the wool industry, during the decade 1910–20, form a very interesting study for the economist. The situations before, during, and after the war are best shown separately:—

I. BEFORE THE WAR (1911 to 1914)

(*a*) *Wool Production.*—The best available statement of the world's sheep and wool production is given in Table 1; it includes figures of the pre-war and post-war periods.

TABLE 1. *The World's Sheep and Wool.*[1]

	Sheep		Wool in lb.	
	Pre-war	Post-war	Pre-war	Post-war
Europe	177,981,207	171,026,261	803,400,043	751,104,667
Australasia	96,189,727	107,467,005	645,132,880	852,122,484
S. America	118,638,046	72,342,762	482,640,707	487,180,000
N. America	54,053,409	49,549,458	303,473,000	327,829,531
Asia	92,318,419	96,735,546	273,146,000	326,505,000
Africa	63,432,755	69,114,685	219,919,000	219,919,000
Central America and W. Indies	710,380		750,000	750,000
Total	603,323,943	566,235,717	2,728,461,630	2,965,410,682

[1] Chiefly from the *Wool Review* of the National Association of Wool Manufacturers, United States.

From these statistics the following interesting deductions are to be drawn. It is somewhat surprising to find Europe heading the list of wool-growing continents. This is largely due to the flocks of European Russia: 320,000,000 lb. of wool (pre-war) are credited under this head, and this probably explains the source of German wool clothing during the latter days of the war. What had become of this huge quantity latterly was not on record in 1921. Incidentally it would certainly appear that the continent of Europe as a wool-growing continent had not claimed the attention merited. In most respects Europe compared more than favourably with other continents, and it was only owing to the diversity of interests, languages, etc., that this was not more in evidence. If the nations of Europe would all pull together, that continent would probably have more to give to the world than to receive.

Europe and North America, being by far the greatest manufacturing centres in the world, have practically consumed the whole of the very large surplus stocks from the other wool-growing countries, apparently in the proportions of 80% for Europe and 20% for North America. The marked difference in the weights of the fleeces produced as indirectly shown by this table is obviously worthy of careful consideration.

(*b*) *Wool Distribution.*—The detailed figures respecting local supplies, importations and reëxportations are very confusing. The figures in Table 2 may be taken—with exceptions to be presently noted—as an indication of the wool each important manufacturing country received. One or two questions here arise. The United Kingdom is credited with manufacturing 90,000,000 lb. approximately of a 120,000,000 lb. clip. It must not be forgotten, however, that a very considerable amount of the world's wool supply passes through the London or Liverpool wool sales, as is shown by Table 3:—

TABLE 2. *Wool-manufacturing Countries.*

Country	Imported for Manufacturing	Local Supplies	Total
1. France (1909)	623,000,000	75,000,000	698,000,000
2. United Kingdom (1911)	490,307,000	90,000,000	580,307,000
3. United States	251,000,000	304,000,000	555,000,000
4. Germany	517,000,000	25,600,000	542,600,000
5. Russia	94,000,000	320,000,000[1]	414,000,000[1]
6. Belgium	355,000,000	1,000,000	356,000,000
Austria, Hungary, Italy and the Netherlands follow in the order named.			

[1] These figures require careful consideration. Probably a large proportion of this wool is usually manufactured in other countries—notably Germany and Britain.

TABLE 3. *United Kingdom Imports and Exports* (1911).

	Imports	Exports	Retained
Colonial	659,511,000		
Foreign	135,004,000		
Totals	794,515,000	304,208,000	490,307,000

The colonial (and foreign) wool not accounted for by Table 3 is no doubt sold direct to the manufacturing countries. This is indicated by the sales of South African wools for the year 1913 (Table 4).

TABLE 4. *Distribution of South African Wools.*

	1913	1919
United Kingdom	96,028,737	96,462,203
Germany	61,123,713	—
Belgium	20,695,225	12,662,059
France	4,898,212	9,588,452
Italy	924,852	43,002
United States	221,522	71,502,522
Japan	—	39,800,648

An analysis of S. American exports would, no doubt, show by far the larger porportion of S. American wools passing directly to Belgium, France, Germany and the United States, a large quantity, of course, passing through the Antwerp sale-rooms.

(*c*) *Tendencies in Production and Distribution.*—In wool production from 1910 to 1914 there is little to note. S. Africa made a valiant attempt to improve both the quality and quantity of her wool, and succeeded in both objects to a certain extent. In Australia certain developments of sheep-growing districts are to be noted, but these, with the increase in the weights of the individual fleeces, probably only just served to balance losses through drought and in other directions. Falkland Island wool (fine crossbred) made a name for itself as a good hosiery wool, but unfortunately the increase up to 1914 was not great. S. America generally proved disappointing, in view of the demand for its wools, not only from the European continent but also from Great Britain, following the decline in the prejudice against them.

Undoubtedly the greatest wool problem prior to the war was the provision of a sufficient quantity of fine merino wool. This is illustrated in Table 5. S. Africa partly met this deficiency, but Australia pinned her faith on mutton rather than on wool, so that the tendency to eliminate the pure-bred merino is still in evidence.

TABLE 5. *New Zealand Wool.*

	Total Sheep	Merinos
1910	23,480,707	1,868,805
1917	25,270,386	1,063,491
1920	23,914,506	803,589

So far as the distribution of the wool manufacturing industry was concerned there was an undoubted tendency in Britain to relinquish wool manufacture owing to severe competition. The continental European competition took the form of efficiency in manipulation and excellence in the goods produced. How Yorkshire was going to face the importation of certain continental goods was a problem—and one that had still to be faced after the war. The competition with the United States was apparently controlled by the tariff charges, but it is more than probable that the excellence of American manufactured goods was already beginning to tell against European importations; although America still had to start her export trade. Yorkshire, however, appeared to be falling between two stools—she was not producing goods of the excellence of the continental styles and thereby forcing a way into neutral markets; nor was she organized on such a scale that she could face the United States' markets—indeed the American manufacturers were surpassing her in scale of organization. It would not be overstating the case to say that the year 1914 opened with many misgivings so far as the British wool manufacturing industry was concerned. The war came, and temporarily dominated everything. But the conditions of 1914 were likely to reappear afterwards, and would have to be faced sooner or later.

II. THE WAR PERIOD (1914 to 1918)

The Slump in Trade.—Fear of the unknown naturally created the trade slump observable during the early months of the World War. Britain, a country whose very life depended upon the importation of the raw material and exportation of the semi-manufactured or fully manufactured article, naturally had most to fear. This fear was further aggravated by the fact that British manufacturers had huge financial interests involved with Germany; and, conversely, Germany had financial interests with Britain. With trade universally in a state of suspended animation, and the sequence of delivery of goods and payment of accounts seriously interfered with, many British firms—and especially those in the wool, top and yarn trade—were at once in serious financial difficulties. The Government, however, tided over the difficulty by the "moratorium," which, by the "time easement" given, enabled the greater proportion of firms eventually to meet their liabilities.

A period of suspense followed, during which the exact trend of many matters was being worked out. By the middle of 1915, however, the idea that, when the British and French armies got going, they would sweep the Germans back into the Fatherland, had practically gone. In the meantime Germany had been swept from the seas. It was now evident that Germany, from the wool point of view, would have to be self-contained, neither importing raw wool[1] nor exporting manufactured goods; that France was seriously incapacitated as a manufacturing country owing to the invasion of much of her manufacturing territory; that Russia would seriously have to draw upon British stocks of manufactured goods; in fact, that Britain must be the mainstay of the Allies—and of the world, with the exception of the United States and Japan—so far as wool manufactured goods were concerned. The extent to which Germany deliberately crippled France both during the war period and subsequently will be realized from the following quotation from the *Yorkshire Observer* in March 1921:—

> "The Fourmies District remained practically the whole time away from actual fighting range and did not suffer from gunfire, but, this notwithstanding, the destruction by hammer, pick, dynamite and fire was complete, the Fourmies woollen plants having always proved most serious competitors of those of Germany. The enemy reached the district on Aug. 26 1914, and left it on Nov. 9 1918. When they arrived there were 75 textile works in full activity; they destroyed all except five worsted spinning plants, one woollen spinning plant and one combing plant. The steam engines were broken or otherwise damaged; the boilers removed and rendered unserviceable, the safes were broken into and all records of manufacture, samples, reference data, representing 30 years of activity, removed to Germany. . . ; Immediately the Germans occupied the northern departments of France, not a single wool-combing machine was left throughout the country; there remained in activity throughout the land only 160,000 worsted spindles out of 2,400,000; only half the total of 700,000 woollen spindles; only about 11,000 weaving looms out of 56,000."

By 1916, two other factors had come into play. The drain on the man-power of Great Britain was becoming serious. But it was now fully revealed that in the wool industry there was a vast surplus of labour ready to maintain output, at least at a very high rate. By April, scarcity of shipping was threatened. Thus early in 1916, if the serious limitation of the supply of raw materials was not actually felt, it was in sight.

The Difficulties Leading to Wool Control.—The British War Office, having in the very early days of the war experienced the difficulty of clothing in khaki the large army in course of formation, organized itself to overcome this difficulty, and by the inevitable restrictions indirectly placed on the manufacture of civilian clothing had so far succeeded fairly well in its direct object. But by the early days of 1916 the War Office was seriously alarmed at the future prospects of supplies of raw materials and sought outside advice. As illustrating the method of working the following may be taken as typical. On Feb. 2 1916 a War Office official (who, incidentally, knew nothing of wool) visited the university of Leeds and asked for certain estimates respecting British combs and spindles, to be supplied to him four days later when the Army Council would meet to discuss supplies. In Table 6 the figures then supplied are given, and alongside the estimates are given also the actual figures, kindly supplied some years later by the same official. The estimate for 1916 was 337,500,000 lb., as against an actual production of 309,443,185 lb., based on the first half of 1917.

The following figures were also supplied on the same date:—

Wool available for use in the United Kingdom	800,000,000 lb.
Less clothing wools used in the woollen trade	200,000,000 lb.
Available for combing	600,000,000 lb.
Less shrinkage and tearage in scouring and combing (40%)	240,000,000 lb.
Wool available for "tops"	360,000,000 lb.

The estimated shrinkage and tearage of 40% would have been much too low—as average Australian merino gives a shrinkage of about 50% and a tearage of from 5 to 1 to 8 to 1—but for the endeavour made to save shipping space by shipping in the scoured state only, and by reason of the large quantities of washed home-grown wools and low-yielding colonial crossbreds included. The effect of this is clearly shown (Table 7) in Mr. Norman Rae's figures published in the *Yorkshire Observer* of Friday, Aug. 10 1917. From these figures it is evident—(*a*) that the Government by 1917 had fears of being unable to

---

[1] With the exception noted with reference to Russian wools.

TABLE 6. *Estimates (Feb. 1916) and Figures.*
(Output of combs per annum.)

Combs			1,500 combs long wool and crossbred each combing 600 lb. per 10 hours		1,500 combs Botany each combing 300 lb. per 10 hours	
Actual 1914	Estd. 1916	Actual 1915	Estimated 1916	Actual (1917)[1]	Estimated 1916	Actual (1917)[1]
2,823	3,000	2,956	225,000,000	206,655,428	112,500,000	92,869,516

(Output of worsted spinning spindles per annum.)

Spindles			2 lb. per week per spindle estimated	
Actual 1904	Estd. 1916	Actual 1916	1916	Actual (1916)[1]
3,000,000	3,000,000	3,241,714	300,000,000 lb.	300,241,712 lb. (The 1915 actual was 253,879,664 lb.)

[1] Large quantities of scoured colonial wools were being imported. Certain worsted wools were also being drawn and spun without being combed, thus eliminating "less tearage."

TABLE 7. *Stock Dec. 31.*

Schwartze % Type	%	Greasy lb.	Clean lb.
72 N.Z. greasy crossbred	70	50,656,000	35,459,000
45 Aust. greasy merino	45	49,438,000	21,258,000

Total	70·87 %	309,967,000	219,682,000

Yield as above . . . 219,682,000 lb. (clean)
Leaving out skins, yield at 50% (instead of 70·87%) . . . 154,983,000 lb. (clean)

Increase (wool under-estimated) . . 64,698,500 lb. (clean)
Skins, 7,238,000 lb., not included.

keep the Allies' wool industries supplied with wool, and much under-estimated the yields—although they had the Leeds University suggestion of 40% for yield and tearage before them; (*b*) that the industry was feeling the shortage of wool and was regarding the future with misgivings; (*c*) that leading wool men thought it actually expedient to question the Government figures, and, if possible, to obtain at once a greater wool distribution; (*d*) that as subsequent figures seem to show, the university figures of 40% average loss between raw wool and finished top and the other figures supplied were most nearly correct, and would have served well as a basis to work upon. All these figures, however, are chiefly useful as illustrating the difficulties involved not only in estimating the workable supplies of wool during the war period but in estimating the yields and in averaging up the quantities of clean wool which the actual deliveries might be expected to give.

How serious was the problem of supplying wool to the home trade, and to such of the Allies as could manufacture it, is shown in Tables 8 and 9. To the quantities shown in these tables should be added something over 300,000,000 lb. of remanufactured materials, probably derived as follows (in 1914 figures):—Of the wool manufactured in Great Britain, 500,000,000 lb., about ⅓ (166,000,000 lb.) is retained at home, and about half this (or 84,000,000 lb.) is torn up each year; rags imported amount to 100,000,000 lb.; so that the total remanufactured materials (excluding noil) amount to 184,000,000 lb. But this is probably an under-statement, as the figures collected by the Board of Trade during the war period show an average approximating to 200,000,000 lb. Thus it would appear that the woollen industry of Great Britain roughly consumes per annum: —200,000,000 lb. greasy wool[1], 200,000,000 lb. remanufactured materials, and 60,000,000 lb. of noil, or a total of 460,000,000 lb.

These figures reveal—(1) the continuous reduction in the quantity of British wool grown and, excepting during the war period, manufactured in Britain; (2) an increase in supplies of colonial and foreign wools, if we take into account the fact that there is possibly still some of the 1919 period wool to be accounted for; (3) the increase in the quantity of colonial and foreign wool manufactured in Britain; (4) the large increase in the foreign and colonial importation in 1915; (5) the effects of the German submarine campaign on the 1918 importation, and the making up of lost ground in 1919; (6) the fact that the average importation of colonial and foreign wool for the five years ending 1919 is much below the five years ending 1914. Had wool gone elsewhere, or had it not been grown? It may be noted (7) that Turkey mohair (sent to Britain by parcel post during the first year of the war) would disappear until 1919, the large increase shown on 1919 being no doubt partly Turkey mohair and partly Cape mohair; and (8) that alpaca, being free, was largely employed to take the place of merino wool during 1917 and 1918, —the clipping of immature fibre led to the marked increase in 1918 and the consequent reduction in 1919.

TABLE 8. *Pre-war Supplies of Raw Materials.*
(In millions of lb.)

Average for five years finishing	1899	1904	1909	1914	1919

Camels' hair	. .	. .	2·7	2·3	4·8

[3] Average for five years = 724 (*see* Table 8).

These facts and figures, although somewhat prematurely placed here, may be usefully borne in mind in studying all phases of the subject.

In April 1916 the Army Contracts Department of the War Office began to commandeer hosiery yarns on the financial basis of a fixed margin to cover the processes of manufacture. A little later restrictions were imposed upon the export of raw wool—possibly owing to rumours of it reaching enemy countries and certainly because wool supplies for home purposes were becoming very restricted. By June 1916 the War Office knew that further control was almost certainly inevitable, and circulated compulsory requests for particulars of stocks of wool, tops and yarn, which requests, of course, were very disquieting to the trade. Later in the same month, so serious was the position judged to be that the War Office prohibited the opening of the British wool fair of Kettering, and, eventually, after some debate, purchased the whole of the British clip at 35% above July 1914 prices. The British clips of 1917 and 1918 were also bought.

---

[1] This figure is questionable as large quantities of so-called clothing wools may be employed for combing purposes.

Anxiety with reference to the possibility of supplying the army with the wool goods it really needed continually increased. In April 1917 the open market for wool was closed and the sales by auction abolished. In May, in anticipation of the lack of wool to keep the factories going and of labour disturbances, an army council order was issued which resulted in the reduction of working hours in the factories from 55½ per week to 45 per week, unless permission was obtained from the director of army contracts to work full time. This order was not withdrawn until May 18 1918, following the enormous demand for flannel goods.

Following the revolt, already referred to, of Yorkshire manufacturers in Aug. 1917, due to War Office restrictions of supplies and of estimates of future supplies, and following the failure of the trade itself to supply reliable data, came the formation of a "Board of Control."

Wool Control.—The Board of Control was organized with Sir Arthur Goldfinch as director of raw material supplies, Col. F. V. Willey as controller of wool supplies, and Sir Charles Sykes as director of wool textile production. The department was housed in the Great Northern Hotel, Bradford, and was given complete control of both supplies of raw material and output of finished clothing. The activities of the department followed briefly the following lines:—(1) A reasonably exact basis of "yields" was ascertained and all wools dealt with on the "clean wool" basis. (2) Reliable statistics were obtained and made the basis of the distribution of supplies of raw materials. (3) A method of "rationing" the margin of wool supplies (about 20% of the available supplies) available for the civilian trade was worked out. (4) Difficulties of a minor nature, such as the supply of oils for oiling wool, soaps for scouring, etc., were faced and usually satisfactorily surmounted. (5) A standard clothing scheme was introduced, the intention of which was, no doubt, good, and its failure only to be attributed to the failure to employ the technical skill actually available in the industry in the designing and displaying of the goods manufactured. Exhibitions were held up and down the country and attracted much attention, but little demand for the fabrics was exhibited. Last, but perhaps not least, the department had to face the problem of relinquishing control on the termination of the war. Those who know the anxiety caused, years before the war was over, by the clearly foreseen difficulties of disbanding an enormous army, will know something of the anxieties of the Wool Control Board to close down with credit to itself and no less to either the wool grower or the wool manufacturer.

Provision for After the War.—The Armistice brought with it the determination of those whose trade had been taken from them by the Wool Control Board to oust the Board and regain their own back again. The Board's function, on realizing the inevitable, was to dissolve (1) with credit to itself, and (2) with due regard to the interests of the wool growers and wool merchants, of the wool manufacturers, and of the consuming public. With the huge demand for goods following the Armistice prices soared up and up, and it was only human that the Board should tend to retain command to its own financial advantage, and also to attempt to prevent undue inflation of values to the detriment of the consuming public. So far as British wools were concerned the removal of control was so simple that no preliminary action was considered necessary, and the restrictions were actually removed in time for the wool fairs in 1919.

To meet the difficulty with reference to Australian wools the Imperial Government had decided to purchase the Australian clip for one year after the war. To further facilitate matters, a Wool Council, which included imperial representatives, was formed by the War Office.

With reference to the interests of the manufacturers and consumers the Government again asked for advice from the university of Leeds through one of its representatives. In a personal interview with the official in question the probable trend of trade after the war was outlined and the suggestion given that, in view of the almost certain shortage of immediately available supplies and the huge demand for fine merino wools, certain manufacturing restrictions—such as spinning only to fine counts of yarn—should be imposed. Unfortunately this suggestion was not sufficiently acted upon, with the result that the army's revolt from rough khaki to fine blue serge sent merino wools soaring up to unthought of heights, all other qualities following suit. The intention of the Wool Council was undoubtedly good, but again the direction of the matter was primarily in the hands of those who knew little or nothing about the wool industry, who could not even judge who were giving them sound advice and who were giving them questionable advice. It may be conceded that to control speculation under the conditions prevailing from 1918 to 1921 was apparently impossible. Apparently the only thing to be done was to unload stocks as rapidly as possible—although one authority did suggest that the way to reduce prices was to keep large stocks of wool and not to sell.

During this period there was much unrest in the labour world and a great deal of talk about "profiteering." As an indirect result of this the Whitley Act was passed by Parliament, and note should here be made of the endeavours made by the British woollen and worsted industries to take advantage of this Act and form "Industrial Councils" composed of employers and employees, also of the formation of the "National Wool Textile Industrial Council," the final draft-constitution of which—prepared by Mr. Ernest Marsh (chairman) and Mr. G. H. Wood (secretary)—as adopted on Dec. 10 1918, was as follows (*Yorkshire Observer*, Nov. 27 1918):—

"The title selected is the National Wool (and Allied) Textile Industrial Council, and its objects are defined as follows:—

To promote the development of the industry and to secure that wages, methods of production, and conditions of employment shall be systematically reviewed and decisions agreed upon which shall have as their object the improvement of the relations between employers and employees.

In furtherance of these objects the Council shall:—

(*a*) Consider wages, hours, and working conditions in the industry as a whole, and the fixing of standard rates of wages for similar occupations in the industry. It shall also consider the employment of scientific and agreed methods of fixing wages, and of adjusting wages to new conditions, and the securing to the employees of a share in any increased prosperity of the industry;

(*b*) Consider the best means of securing the highest efficiency of the industry, including any improvement in machinery, invention, or method by which the prosperity of the industry is to be increased; secure that such invention or improvement in method shall give to each party a fair distribution of the benefits derived from the increased efficiency; utilize to the fullest extent the practical knowledge and experience of the workpeople, and secure that such knowledge may receive consideration;

(*c*) Consider the existing machinery for the settlement of differences between different parts and sections in the industry, and the establishment of regular methods of negotiation on anticipated issues between employers and employees, and upon differences which may be reported with a view to the prevention of differences and their equitable adjustment;

(*d*) Consider the supervision of the entry into and training of employees for the industry, and coöperation with the educational authorities in arranging educational facilities for the industry in all its branches;

(*e*) Make comparative studies of the workings and methods of the industry in this and other countries, and when desirable publish reports;

(*f*) Secure to the workman a greater share in and responsibility for the determination and observance of the conditions under which he works, in so far as it relates to his material comfort and well-being; make efforts for the decasualisation and permanent security of employment, having regard to the conditions surrounding changes of occupation between one employer and another; consider means toward the improvement of conditions with a view to removing the danger to health in the industry, and toward providing special treatment where necessary for employees in the industry;

(*g*) Make reports to Government departments and local authorities of the needs and opinions of the industry; consider any questions bearing on such matters which may be referred to the Industrial Council by the Government or by a Government department; consider jointly all proposed legislation affecting the industry and take joint action where such legislation is likely to interfere with its prosperity;

(*h*) Consider the best means of insuring the observance of the decisions of the Council and of agreements made between organizations of employers and employees;

(*i*) Consider means whereby the employers and employees shall be brought within their respective associations."

This Council steadily extended its activities, and may ultimately be the deciding factor in helping Great Britain to maintain and possibly to extend her manufacturing position.

Another indirect result of the war was the development of industrial and scientific research. The university of Leeds (so far as the wool industry was concerned) here took the lead, and, in conjunction with the West Riding County Council and with the help of many prominent manufacturers in the various manufacturing districts, raised approximately £5,000 per annum for a period of five years. With the development of the Government Department of Scientific and Industrial Research, however, came the question of overlapping, and the university, while naturally retaining its own research status, not only gave way to the new department but strenuously helped in the development of "The Research Association for the Woollen and Worsted Industries" now housed in Leeds. This Research Department is designed to cover the requirements of Great Britain and Ireland.

III. After the War (1918 to 1921)

Withdrawal of Control from British Wools.—Under political pressure the Government freed the wool fairs of 1919 from State control. But a curious tendency now made itself felt. Owing to the limitation of supplies of colonial crossbreds and other crossbred wools, woollen manufacturers had been constrained to use British Down wools and Down crosses. These were discovered to possess just the characteristics sought for in certain woollen goods. They were also the wools sought for by the hosiery manufacturer; and as hosiery now took a wonderful development the Down wools went soaring away in price, at last almost rivalling colonial merinos. When the slump came, Down wools stood out against it even longer than merinos, and it seemed probable that when trade should revive Down wools would again come into their own. In view of the great future before Down wools it was regrettable that more British farmers did not follow the suggestion to grow Down crosses, as strenuously advocated by qualified representatives of the universities of Edinburgh and Leeds.

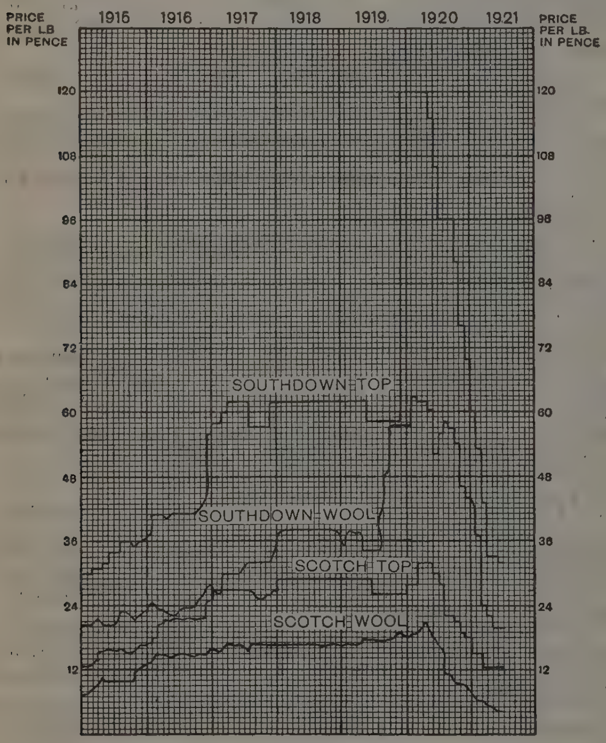

CHART 1

Values of British Wools and Tops (1911 to 1921).

The changes in values of British wools and tops are shown for the decade in Chart 1.

Of course the high values shown in this chart are fictitious in more senses than one, but it would seem that if the 1921 prices of these wools had been brought to the 1914 basis they must be so cheap that demand for goods manufactured from them would have been immediate. Probably the large stocks of manufactured goods still held in 1921 by the middleman kept the prices of these goods at an artificial height and thus lamentably interfered with trade.

Withdrawal of Control from Colonial Wools.—The Wool Council of the War Office on the cessation of hostilities found itself in great difficulties with reference to colonial wools. Just as on the outbreak of war no one knew what would happen, so in this case it was impossible to foresee whether the enhanced values of the war period would be maintained or prices rapidly fall. If prices had rapidly fallen it is possible that the wool grower would have held the Wool Council to its bargain, and no one could well have found fault with their attitude. But prices rapidly rose, and so it came about that the colonial wool grower felt aggrieved that he was not going to profit by the enhanced wool values like the home wool grower. Thus it came about that the Imperial War Council agreed to share the very substantial prospective profits with the colonial wool grower. Unfortunately much of the 1919 wool had not been brought under the hammer before the slump started (May 1920), but it was stated that, after the British Treasury had been reimbursed for the expenditure it had incurred, there was at the end of 1920 a clear profit of £14,000,000, half of which belonged to the growers, bringing their total receipts up to £180,896,059. In addition to this there remained unsold (Dec. 1920) 1,800,000 bales, half of which belonged to the growers.

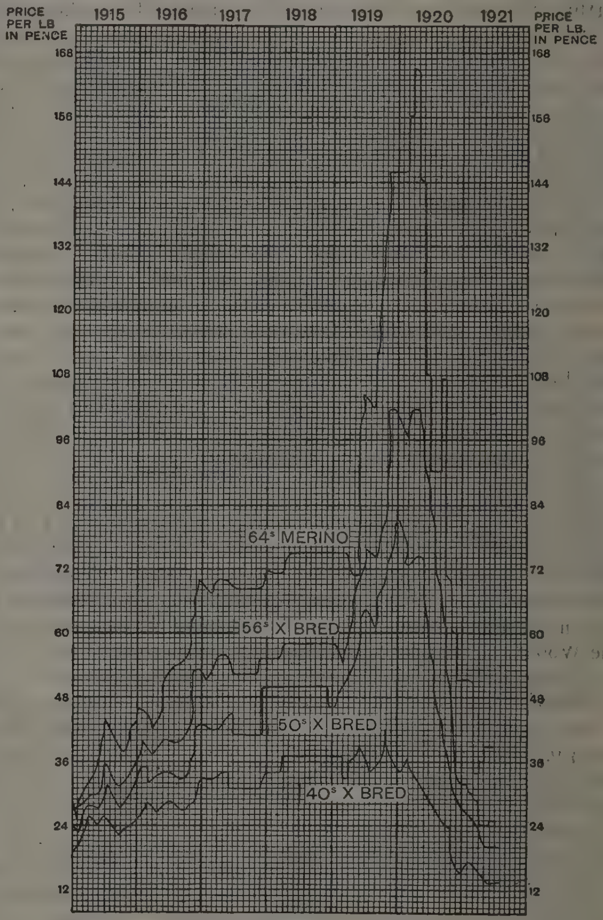

CHART 2

Values of Colonial Wools and Tops.

The change in the values of colonial wools and tops during the decade are shown in Chart 2.

Up to May 1920 the endeavour of the Wool Council was rather to maintain than to inflate values, and much fault was found with the Council for not making greater progress with the disposal of the wool to hand—the manufacturers were crying out for it. To meet this demand the Antwerp sales were reopened on Oct. 25 1919 and extensive sales in the United States of America were also promoted, one of the first being held in Philadelphia in Sept. 1919. Apparently the fall in the prices of wool was almost coincident with the release of ships for transport. Unfortunately few realized the large stocks of wool on hand—or rather they estimated their consumption at the 1919 rate and consequently minimized their stocks. Thus it came about that, following a period when every conceivable bale of wool was called for and (from the sellers' point of view) ought to have been placed on the market, came a period when with bated breath one heard the word "unloading," and all too soon new wool and old wool were on the market together.

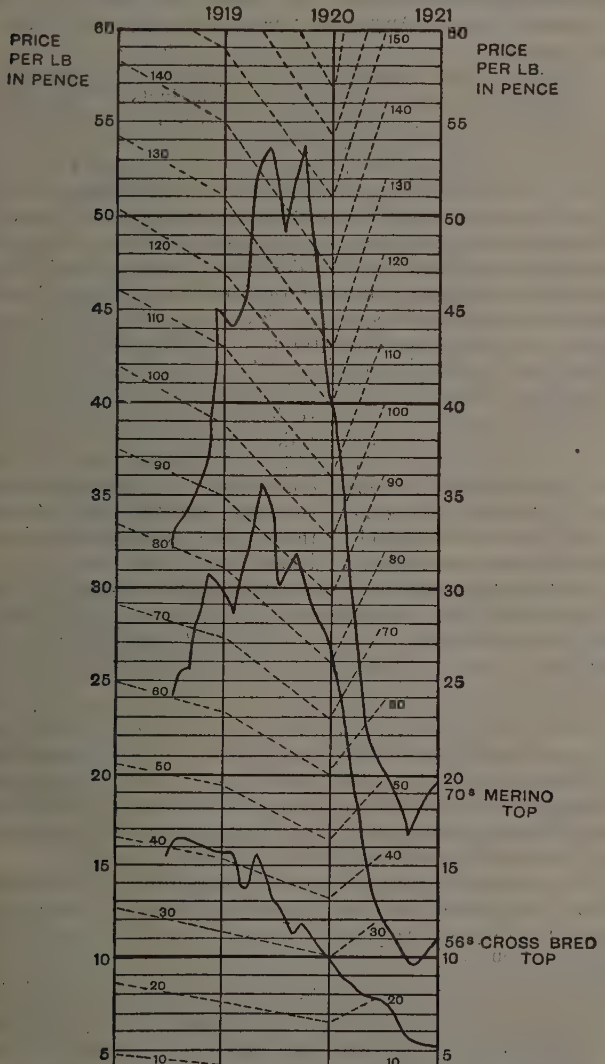

CHART 3

Wool Values Adjusted to 1914 Values.

Adjustment of Sale of Old and New Wool.—In the early days of 1920 those starting new works in the colonies, India and elsewhere, were asking—can we obtain sufficient wool to run our factories? And there was every inducement to wool growers—particularly growers of the finer sorts—to extend operations. Toward the end of 1920 almost all factory building the world over was suspended or carried on very leisurely; and with the fall in wool values many sheep breeders were already looking on wool as an almost valueless by-product. Probably both extremes were wrong. Table 10 gives a fair idea of the world's wool stocks about the end of 1920 or early in 1921.

TABLE 10. *World's Wool Stocks* (*Approximate*)[1]

Wool in England (held by the B.A.W.R.A.)	1,600,000 bales
" " Australia " " "	800,000 bales
Cape wool (held by B.A.W.R.A.)	100,000 bales
U.S.A. surplus stock (Oct. 1 1920)[2]	1,000,000 bales
S. American wool	5,000 bales
Total	3,505,000 bales

[1] No doubt small stocks were held elsewhere.

[2] Two years' stocks said to be accumulated.

Prior to the war the world's yield of wool was about 2,728,461,630 lb., and it might be taken that about this amount was yearly absorbed. It would thus appear that the surplus wool on hand was equivalent to about 14 or 15 months' normal world's consumption.[1] Now if there were serious depletion of stocks of manufactured goods, and if there were likely to be a greater demand from the better paid workers of the world, and from countries likely to demand wool goods which previously had not consumed such goods in great quantities (India for example), then the stock of wool would appear hardly sufficient to meet the probable demand. Possibly these brighter conditions might have been realized, but for over speculation in the wool industry and the general slump in prices. Actually, however, what did happen was that the countries which could purchase were inundated with the goods which, under normal conditions, would have been spread over a broader field and the slump followed storage of goods and lack of sales. The reaction probably went much too far—for the home market in Britain was good in the middle of 1921. But the Wool Council had not only to face this surplus of wool but the new wool (1920 clip and in prospect the 1921 clip) coming on to the market at the reopened sales in Australia. The adjustment of this prospective difficulty was exemplified as shown in table 11 in the quantities of old and new wools—offered, sold and withdrawn—in both London and Australia in June 1921. Of these quantities, about 79,500 bales, of which approximately 76,000 bales were colonial, were sold; 44,000 bales were taken for export, including 2,000 bales Punta Arenas and Falkland Islands; 8,000 bales went to America. At the April 1921 London sales the reserve prices of the old wool were so high that no bids were forthcoming and all of this wool was withdrawn. Owing to the formation of the British Australian Wool Realization Association not being completed, or rather its policy not being decided upon, all the Australian old wool sales for April 1921 were also cancelled.

TABLE 11. *London Colonial Wool Sales* (Feb. 22 to March 5 1921).

	On Government Account	On Importers' Account
	Bales	Bales
Sydney	24,567	9,889
Queensland	4,991	6,435
Port Philip	12,862	3,274
Adelaide	5,286	1,542
Tasmania	2,648	279
Western Australia	3,599	10,507
New Zealand	20,264	10,213
Cape	..	3,134
Punta Arenas	..	3,487
Falkland Islands	..	577
River Plate	..	165
Sundries	..	724
Total	74,217	50,226

The difficulties of adjustment, actually realized later, were foreseen and deemed so great that when Mr. Hughes (Prime Minister of the Commonwealth and a stalwart fighter for the development of Australian wool industries) proposed to form an association of Australian wool growers and British Government representatives, with the object of realizing at reasonable values the large stocks of wool held in Australia and England, the Wool Council accepted the proposed control. Indirectly the Wool Council was apparently sacrificing the possibility of cheap wool for the manufacturers of this country: but it regarded the pocket of the whole country as coming first and the manufacturers' demand for cheap wool as coming second. The Australian Board was thinking chiefly of the interest of the Australian grower. The association was registered in April 1921, as follows:—

---

[1] The U.S.A. normally holds 400,000,000 lb. of wool in stock.

> "British Australian Wool Realization Association, Ltd., Caxton House, West Tothill Street, Westminster, London, S.W.1. Incorporated in the State of Victoria, Australia. Registered April 14, to acquire and take over (*a*) one-half share of, or interest in, all Australian wool bought by the British Government through the Government of the Commonwealth of Australia and still undisposed of, and in all real and personal property acquired in connexion therewith and still undisposed of; (*b*) one-half share of, or interest in, any surplus profit on resale of Australian wool so bought still undistributed. Also to take over and assume one-half of all or any liabilities and obligations connected with and chargeable to such wool, property and surplus profits not yet liquidated. Nominal capital £25,000,000 in 25,000,000 shares of £1 each. Names of persons authorized to accept service; Sir Arthur Horne Goldfinch, K.B.E., 8 Rosecroft Avenue, Hampstead, London, N.W. (Governing Director British Australian Wool Realization Association, Ltd., Delegate General Chilean Nitrate Producers Association); James Alexander Cooper, C.B.E., F.S.A.A., Mentmore House, Uxbridge Road, Kingston on Thames, Surrey (Assistant Governing Director, British Australian Wool Realization Association)."

With the lack of demand for goods and consequent lack of consumption of wool the world over, even the best merino continued to fall in value up to May 1921, and the poorer sorts in some cases were below 1914 values (*see* Chart 3). Whether the enhanced values realized in May by both merinos and crossbreds would be maintained was questionable. Table 11, from the *Yorkshire Observer* of May 16, showed a turn of the tide—if there were no set-backs. Demand from the United States in anticipation of the new tariff might be, at least in part, the explanation. Germany had already commenced to buy wool.

TABLE 12

1914	Description	1921	1921
July d. per lb.		May 7 d. per lb.	May 12 d. per lb.
	Combing		
32	70's super fleeces	40/42	40/44
30½	64/67's good medium fleeces	35	36
30	60/64's good medium fleeces	27	30
28	64's good pieces	30	33/36
27	60's good pieces	30	33/36
27	60's good pieces	23	26/28
29	58/60's good medium fleeces	30	30
26	56's fine crossbred fleeces	24	24
23½	50/56's fine crossbred fleeces	17	18
18	46/50's crossbred fleeces	14	15
17	46's crossbred fleeces	12	13
16	44's crossbred fleeces	10	11
15½	36/40's crossbred fleeces	9	9
	Capes		
27	10/12 months' combing Capes	28/30	None
24	6/7 months' good clothing Capes	None	None
	Carbonizing		
26	60/64's good carbonizing pieces	23	26
25	60/64's carbonizing pieces and bellies	20	24
20	64's average locks	16	18
—	64's average lambs	20	20

IV. PROSPECTS IN 1921

Wool Manufacturing.—Australian combed tops were on the Bradford market, on the American market, and were also being worked up in Japan in 1921. Did this presage a re-distribution of the world's wool manufacturing industry, and if so what was the line of distribution likely to be followed?

The astounding prosperity of the British wool-manufacturing industry following the Armistice attracted world-wide attention, and it was but natural that every one with any connexion with the industry the world over should wish to share in the prosperity. There were two types of country in which the development of manufacturing would undoubtedly be attempted, and in which the attempt is undoubtedly justified, (1) the wool-producing continents or countries, Australasia, S. Africa, and S. America, and (2) new wool-consuming countries such as India, Japan, Brazil. In Australia some few mills were developing before the war, and after the war, under private enterprise, stimulated by the energy of Mr. Hughes and others, and, in some cases, further encouraged by the mother-country financiers. Australia made strenuous endeavours to develop a huge wool-manufacturing industry. Her ideal was to manufacture one-tenth of her wool production per annum—say, 50 to 60,000,000 lb., and in 1921 nearly 40 wool manufacturing mills were already in existence. Similarly South Africa, stimulated by Gen. Enslin, was also making a bid for wool manufacturing.

In the case of Australia no forethought or skill was being spared. The mills were being equipped with the finest machinery—French-made combs, for example, had so far been given preference over the speedier but less exact British (Noble) combs—and the best skilled workers were engaged in many of the mills. Excellently combed Australian tops were already on the Bradford market.

So long as profits remained high and high rates of wages were maintained, the appeal to the financial instincts of the worker, even in the case of Australia, might be expected to hold him in the mill. But if the conditions of 1914 came round again and the skill and temperament of the newly developed Australian industry were pitted against the skill and temperament of the older industrial countries, which would win out? Broadly speaking, in anything beyond combing it would be the older countries' fault if they did not dominate. Again, with the need for harder conditions in the factories which must almost inevitably follow severe competition, it was a question which operatives would best stand the strain. Australia, and possibly S. Africa and S. America, might develop quite considerable wool manufacturing industries, but it would seem inevitable that the old manufacturing countries would almost entirely retain their hold on the bulk of the world trade in manufactured wool goods.

In the case of India, Brazil and more particularly Japan, it was probable that the growing demand for wool goods would be only partly met by local production, and for some years to come the outside demand of these countries for manufactured goods seemed more likely to develop than to contract.

So far as the British wool-manufacturing industry is concerned everything depended upon (1) the introduction of scientific method into the works; (2) efficiency in manipulative skill, and (3) efficiency in organization. With reference to the first and second points the introduction of automatic machinery was day by day placing an enhanced value on careful, thoughtful workmanship. The Englishman likes to get a job done, he prefers "driving force" to thoughtfulness. The continental controllers and workers are too often years ahead of the British managers and workers; in thoughtful outlook the American managers and workers are up to the British in bulk production and threaten to pass them even in excellency of output.

With reference to the third point, organization depends upon both directors and workers. An unsympathetic attitude on the part of either will lead to trouble and disaster. The scale of organization had probably been set by the United States. There the Arlington mills each day treat the fleeces of about 35,000 sheep—say, 200,000 lb. of wool: and this is said by no means to be the largest wool manufacturing company in the United States. Along with this enormous organization goes an efficiency in organization and cleanliness in installation which puts most European mills to shame. The American manufacturer has no time to develop that "secrecy" which is far too much in evidence in European concerns; he relies upon progressive efficiency.

To sum up, it would seem that while wool-growing countries may develop quite considerable wool-manufacturing industries, these will not be to the exclusion of the older manufacturing countries. On the other hand, American enterprise (and possibly Japanese enterprise) will severely test the resources of the older industrial countries, and success will rest in the future with the country developing the most thoughtful captains and rank and file of industry.

(*b*) *Wool Production.*—During the high prices period of 1918 to 1921 the demand for wool was so great, and future prospects for the wool-grower seemed so rosy, that likely and unlikely fields for the development of sheep-breeding were considered. With the slump in prices the future prospects of the wool-grower suffered an apparent eclipse. No doubt in 1920 prospects were considered too rosy, but equally in 1921 prospects were regarded in altogether too sombre a light. A few broad glances at the situation will clear the way.

If we take the United States as practically a self-contained country, and allow the approximately ten million negro population (wearing little or no wool) to balance the extra wool required for garments in the northern states, where cold winters have to be faced, we get this interesting result:—Wool consumed, 600,000,000 lb.; population, 100,000,000; or 6 lb. of wool per head per annum. Even if we allow for a considerable quantity of re-manufactured material and also for the negro population, this can only be regarded as a "miserable statement," for the 6 lb. is greasy wool yielding about 3 lb. of clean wool, or half a suit or half a dress length per annum for each male and female in the United States. In this allowance are included the imports of wool materials (other than raw wool) amounting to an average of over 30,000,000 lb. per annum. Neither Great Britain, France nor Germany shows any advance on this.

The world's wool statistics and population only serve to emphasize the lack of supplies; for taking the pre-war figure (given in Table 1) of 2,728,461,630 lb., and allowing an average yield of 60% clean wool, this leaves about 1,400,000,000 lb. of clean wool to serve for a world's population of 1,606,542,000 or ·9 lb. of wool per male or female. To make this discrepancy even clearer, however, take only the population of Britain, Canada, Australia, the United States, France, Germany, Austria, European Russia and the Netherlands—these total up to approximately 282,000,000 souls, consuming hardly 6 lb. per head per annum. The problem of the future would seem to be:—How to develop such conditions of livelihood the world over that the greatest possible number become substantial purchasing (or exchanging) units?

What possibilities of increased supplies are there? These may be grouped under two heads: (1) an increased yield from the present flocks, and (2) the opening up of new tracts of sheep-rearing land. The first point is admirably illustrated by particulars taken from Table 1, the weights of fleeces for the several continents working out as follows:—

Europe	$\frac{8034}{1780}$	5 lb. per fleece.
Oceania	$\frac{645}{96}$	7 " " "
S. America	$\frac{4826}{1186}$	4 " " "
N. and Central America	$\frac{3042}{547}$	6 " " "
Asia	$\frac{2731}{923}$	3 " " "
Africa	$\frac{2199}{634}$	3 " " "

In some cases the sheep-lands are too poor to be expected to do better, but it will probably be found that this is very rarely the case. It is stated, for example, that Herdwick sheep, living on Cumberland hills which will hardly support rabbits, will produce fleeces from 5 lb. to 10 lb. weight. But what may be effected through careful selection is best illustrated by the following record of New South Wales flocks:—

Period	Sheep	Average Weight of Fleece	Total Weight
1890–3	60,000,000	3 lb. 9 oz.	213,700,000
1900–3	36,000,000	6 lb. 3 oz.	222,750,000
1916–9	35,000,000	8 lb. 7 oz.	295,310,000

Thus with 25 million fewer sheep in 1916 as against 1890 some 80,000,000 lb. more wool was produced. Great Britain has seriously taken these figures to heart, and under the auspices of the Research Association for the Woollen and Worsted Industries strenuous endeavours are being made, (*a*) to increase the quality and yield of the well-established breeds of sheep, and (*b*) to improve the quality of the wool in certain mountain types by crossing with better quality sheep, especially Down sheep.

With reference to the second point, although nothing like the development of a second Australia is to be expected, it is already obvious that marked developments of sheep-growing tracts of land may be expected. In the spring of 1921, for example, Col. Robert Stordy, on behalf of the Peruvian Government, sailed from Britain with cargoes of Southdown, Suffolk Down, Shropshire, Rambouillet (merino) and Soay rams, with the object of developing wool growing in Peru. Wool analysis of the Peruvian wools grown in 1921 on the degenerate sheep of the country, as analyzed by the university of Leeds, revealed remarkable qualities specially acceptable to the hosiery manufacturer. The development of Peru as a wool-growing country is one of the most fascinating possibilities.

The Duke of Devonshire, Governor-General of Canada until 1921, was specially interested and concerned in the development of the prairie lands of the Dominion on the four years' rotation basis, and one of the years will mean sheep. Thus it is quite possible that in the near future Canada will produce more wool of the Down type and possibly of the merino type: for if Russia can raise merinos amid the snows of winter, why not Canada? The Indians and Japanese are both making inquiries with the idea not only of improving the breed of such sheep as they have but also of developing large tracts of land which probably could well carry sheep.

(*c*) *Wool Distribution.*—The question as to where the wool of the world will be distributed for manufacture and re-distributed for wear, is largely a matter of surmise. and, after the extraordinary change from the conditions prevailing in the early months of 1920 to the conditions prevailing in the early months of 1921, even the most reliable authorities hesitated to commit themselves. If the world becomes more stabilized, and the suppressive effects of vested interests on the one hand and of "ca'canny" on the other are brought within reasonable limits, then it may be that conditions as rosy as 1918 to 1921 will return with accompanying similar conditions in other industries. To meet such conditions, should they arise, will necessitate the employment of every possible type of automatic machine, and a developed skill depending on the quality of "thoughtfulness" on the part of the individual worker in using such automatic machinery. It will thus be evident that forethought, efficiency and skill will play a greater part than ever in deciding the peoples to whom the bulk of the world's wool shall pass to be manufactured. Australia will undoubtedly manufacture an increasing quantity of wool—but she may possibly grow an even greater quantity than that demanded to balance for the manufacturing in her own mills. S. Africa, S. America, India and Japan will no doubt all claim their quota for manufacturing purposes. But the great bulk of the wool will be manufactured elsewhere: and it is safe to say that will be where scientific method and scientific management and a broad, humane outlook dominate. And the manufactured material of course will go to those peoples who have something to offer in exchange.

It is true that the immediate outlook in 1921 was dark. But the reason why was becoming apparent. And when this was fully realized the world would be well on the way to adjust its economic condition to facilitate production and exchange to the advantage of all its peoples. (A. F. B.)

WOOLDRIDGE, HARRY ELLIS (1845–1917), English musical antiquary, was born in 1845. He studied art, and became a student of the Royal Academy in 1865, about the same time commencing his researches into early music. He received various commissions for artistic works, the most important being a reredos for St. Martin's church, Brighton, and the frescoes in St. John's church, Hampstead. At the same time his reputation as an authority on music was steadily rising, and in 1895 he was elected Slade professor of Fine Arts at Oxford, a post which he held until 1904. His chief works on music are a new edition of Chappell's *Popular Music of the Olden Time*, which appeared under the title *Old English Popular Music* (1893) and *The Polyphonic Period*, parts I. and II. (vols. i. and ii. of the *Oxford History of Music*, 1901–5). He died in London on Feb. 13 1917.

WOOLWORTH, FRANK WINFIELD (1852–1919), American merchant, was born near Rodman, N.Y., April 13 1852. He was reared on a farm, studied in the public schools, and graduated from a business college at Watertown, N.Y., in 1872. He began his career as a clerk in Watertown, and it is said that a bargain counter in his employer's store first suggested to him the idea that resulted in the establishment of the long chain of "five and ten cent" stores that bear his name. Early in 1879 he opened at Utica, N.Y., his first "five cent" store which, however, was a failure. Later in the same year he established a similar store at Lancaster, Pa., followed by another at Harrisburg. The chain in 1920 was composed of about 987 "five and ten cent" stores in the United States, 94 in Canada, and 81 in England. When the F. W. Woolworth Co. was incorporated in New York in Dec. 1911 he became president. In 1912 the Woolworth building in New York City, costing $13,000,000, was completed from the designs of Cass Gilbert. It is 760 ft. high, has 57 storeys, and, excepting the Eiffel Tower in Paris, is the tallest building in the world. The gross sales of the company in 1920 amounted to $140,918,981 and the net profits $9,775,251, as compared with $119,496,107 and $10,361,557 respectively in 1919. Woolworth died at Glen Cove, L.I., April 8 1919, leaving an estate appraised at $27,000,000.

WORDSWORTH, ELIZABETH (1840–), English educationalist, was born at Harrow June 22 1840, the eldest daughter of Christopher Wordsworth, afterwards Bishop of Lincoln, and hence a great-niece of the poet. She was educated at home and lived a home life until in 1879 Lady Margaret Hall was founded at Oxford, largely owing to Miss Wordsworth's energy and organizing capacity, and she became its first principal. Her social gifts and powers of clever conversation made her a prominent figure in Oxford life. She retired from her post at Lady Margaret Hall in 1909, but continued to live in Oxford and to be an active member of its council. In Oct. 1921 the university of Oxford conferred upon her an hon. M.A. degree. Miss Wordsworth contributed many charming tales to *Aunt Judy's Magazine*, edited by Mrs. Gatty (*see* 11.530), and also published various devotional books and volumes of verse and essays. In collaboration with J. Overton, she published in 1888 the *Life of Christopher Wordsworth*.

WORDSWORTH, JOHN (1843–1911), English divine and scholar, was born at Harrow Sept. 21 1843, the son of Christopher Wordsworth, afterwards Bishop of Lincoln, and grand-nephew of the poet. He was educated at Winchester and New College, Oxford, where he had a distinguished career, and after a short period as a master at Wellington College was elected a fellow of Brasenose and took orders (1867). He became widely known both as a Latin scholar and as a theologian, being elected Bampton lecturer in 1881 and Ireland professor of exegesis in 1883. In 1883 he became a canon of Rochester and in 1885 Bishop of Salisbury. His works include *Fragments and Specimens of Early Latin* (1874); *Old Latin Biblical Texts* (1883 and 1886), vol. ii., in conjunction with Dr. Sanday and Rev. H. J. White; *The Episcopate of Charles Wordsworth* (1898); *Teaching of the Church of England for Information of Eastern Christians* (1900); *The Invocation of Saints and the 22nd Article* (2nd. ed. 1910). He died at Salisbury Aug. 16 1911.

WORLD WAR, THE.—The military history of the World War is told in these New Volumes in separate articles dealing with campaigns and battles; and a general account of the war at sea is given in the article Naval Operations (supplemented by separate articles on the battles of Jutland, Dogger Bank, Coronel, Heligoland Bight, Falkland Islands, Zeebrugge, and on the Goeben and Breslau affair, together with those under the headings of Submarine Campaigns, Blockade, Minesweeping and Minelaying and Convoy). As regards the land operations, reference to the separate headings under which the military history is narrated may best be made here by a brief *résumé* of the course of the war.

The war opened simultaneously on three fronts in Aug. 1914. These fronts were the western, the eastern and the Serbian, and the continuous story of the major operations on these fronts will be found under the respective headings: Western European Front Campaigns, Eastern European Front Campaigns and Serbian Campaigns, together with Salonika Campaigns. In the west the German invasion of Belgium and France was marked by the five-fold battle of the Frontiers (*q.v.*)—in Alsace, Lorraine, Ardennes, at Charleroi and at Mons—by the sieges of Liége, Namur and Maubeuge (*qq.v.*), and by the battle of Guise (*q.v.*). Its culmination in the battles of Sept. 4–20 is told in detail under the heading Marne; and the development of the northern flanks of the opposed armies towards the sea, at the same time as Antwerp (*q.v.*) fell to the Germans, is dealt with under the headings Artois (*A*, *B.*), and Ypres and the Yser (part I.).

On the eastern front the Russian invasion of East Prussia, with its battles of Tannenberg and the Masurian Lakes, is dealt with in detail under the heading Masuria, Battles in (parts I., II.), while the main conflict between the Russian and Austrian offensive efforts in Galicia and Poland during August and early September is described under Lemberg (part I.). The subsequent united efforts of the Austrian and German armies in Poland and Galicia to stem the onset of the "steam-roller" may be divided into periods characterized by the battle names Vistula-San (*q.v.*), and Lodz-Cracow (*q.v.*). The first siege of Przemysl will be found under that heading. The three Austrian invasions of Serbia are described in the general article for that front, mentioned above.

The year 1915, a year of stabilization on the western front, was one of open warfare on the eastern. Beginning with the battle of the Carpathians (*q.v.*) and the second siege of Przemysl (*q.v.*) on the one flank, and the "Winter Battle" of Masuria (*see* Masuria, Battles in, part III.) on the other, the operations, after a pause, took shape as a general Austro-German offensive from May 1. The right half of this offensive preceded the left by two months, and its successive episodes are marked by the battles of Gorlice-Tarnov and the San (*see* Dunajec-San and Przemysl), the battles of Grodek, Lemberg and Stryi (*see* Lemberg, part II.), and by the later episode of Rovno (*q.v.*). At a certain stage in the development of these operations, their left wing becomes one branch of a double-envelopment aimed at the rear of the Russian centre in West Poland; this branch is the campaign from the Tanev river against Brest Litovsk (*q.v.*), while the other is the offensive of the "Gallwitz army" from Przasnysz, across the Narew into the interior of the corridor followed by the Russians in their retreat (*see* Narew, Battles of the). The final efforts of the Germans to isolate the retreating Russians, which ended in ill-success and in the formation of a stable trench-line, as in the W., are dealt with in the general military narrative of operations on the eastern front, named above.

In the E. the entry of Turkey into the war led to the expedition against the Dardanelles (*q.v.*), and to the renewal of the offensive of the Central Powers against Serbia in the autumn of 1915 (*see* Serbian Campaigns), which closed with the conquest of Serbia on the one side, and the creation of a new minor front at Salonika on the other (*see* Salonika Campaigns). The campaigns in Asia Minor are dealt with under the general heading Turkish Campaigns, of which the several sections describe the operations which took place in the Caucasus, in Mesopotamia and in Sinai and Syria.

In the W. the years 1915, 1916, 1917 are essentially the "trench-warfare" period. The battles of Ypres in 1915 (*see* Ypres and the Yser, part II.), of Neuve Chapelle, Carency, Souchez and Loos (*see* Artois, Battles in, *C*, *D*, *E.*) respectively, the minor offensive of Crouy, the winter battle in Champagne (*see* Champagne, parts I., II.), and the trench-warfare fighting in Argonne (*q.v.*) and Woëvre (*q.v.*), culminated in the great French offensive of Sept. 25 1915 in Champagne (*see* CHAMPAGNE, part III.), but without materially affecting the stability of the trench-warfare conditions. The year 1916 opened with the great German blow at VERDUN (*q.v.*), which forestalled the Allied offensive of the SOMME (*q.v.* part I.): these two great names fill the history of the 1916 campaign in the west. In 1917 a first essay in operating under a united command was made by the Allies in the spring campaign, and produced the Arras battles described under ARTOIS (*F, G, H.*), and the Aisne offensive of April (*see* CHAMPAGNE, part IV.); the results were disappointing, and the parts of the inter-allied machine fell asunder, the British taking up the weight of the task in the battles around Messines, Ypres, Passchendael, etc. (*see* YPRES AND THE YSER, part III.), and in the "tank-battle" of CAMBRAI (*see* ARTOIS, section I.), while the French carried through two battles of limited objective, described under CHAMPAGNE (part IV.) and VERDUN.

Meantime, the entry of Italy into the war in 1915 had created new military relations in the Mediterranean basin. Austria had established a new defensive front on the Isonzo, and, shortly after the Verdun offensive of her ally, had struck a similar blow on the Tirol front at Asiago. The unity of operations in the Italian theatre of war makes it possible to refer the reader to a single heading, ITALIAN FRONT CAMPAIGNS, with the subordinate articles therein referred to, for the story of the war in this region from first to last.

On the Russian front, the year 1916 saw a final effort of Russia, in spite of losses, to regain lost ground and to help her Allies. The battles, after an isolated winter battle known as the "New Year's fight," described under the heading STRYPA-CZERNOWITZ, fall into two main groups, those of the spring and those of the summer and autumn, in which the battles of NAROCH LAKE (*q.v.*) and LUCK (*q.v.*) are the central episodes.

The spring of the final year, 1918, finds the focus of military events in Europe placed on that section of the front in France which lies north of the Oise. Here, on March 21, the great German offensive broke through the lines of the British V. Army (*see* SOMME, part II.); here also, on April 9, a second effort was made at the LYS (*q.v.*). In summer, the German attacks of May 27 on the Chemin des Dames (*see* CHAMPAGNE, part V.), of June 9 on NOYON (*q.v.*), and of July 15 on both sides of Reims (*see* CHAMPAGNE, part VI.), culminate, and the period of Allied counter-attacks under united command begins with July 18 (*see* CHAMPAGNE, part VII.), Aug. 8 (*see* SOMME, part III.), Aug. 21 (*see* SOMME, part IV.) and St. Mihiel (*see* WOËVRE), to assume at last a coherent and decisive form in the three simultaneous offensives of the Americans in the MEUSE-ARGONNE (*q.v.*) battle, of the British in the battle of CAMBRAI-ST. QUENTIN (*q.v.*) and the Belgians, British and French in the last battle of YPRES (*q.v.*).

As regards the origin of the World War, its history is told in the article EUROPE, in the final section of which its results on the national reshaping of Europe after the war are analyzed. Reference on both these aspects may also be made to the historical and geographical sections of the articles dealing with each country involved in the war. But during the war itself the political aspects ceased to be merely European: it became a World War. The general international politics throughout its course are therefore dealt with under the present heading, in the article below, as distinctively world-history, by way of continuation of the historical article under EUROPE which deals with the international politics of Europe up to August 1914. (H. CH.)

POLITICAL HISTORY OF THE WAR[1]

From the moment hostilities began in 1914, it became the absorbing aim of all the combatant countries to win the war; but each of them placed a different interpretation upon the meaning of victory, and that meaning also varied with their fortunes, the eclipse of this or that belligerent, and the entrance of fresh forces into the arena. The war aims of Great Britain were tersely stated in general terms by Mr. Asquith at the Guildhall on Nov. 9 1914, when he declared: "We shall never sheathe the sword, which we have not lightly drawn, until Belgium recovers in full measure all and more than all that she has sacrificed, until France is adequately secured against the menace of aggression, until the rights of the smaller nationalities of Europe are placed upon an unassailable foundation, and until the military domination of Prussia is wholly and finally destroyed." France and Russia, while agreeing with these objects, mentally put a more concrete interpretation on victory: to France the symbol of victory was the restoration of Alsace-Lorraine with further guarantees against a repetition of 1870-1; while Russia desired to exorcise Prussian apparitions "in shining armour" at Petrograd and to secure control of Constantinople and the Straits.

The Original Combatants.—Germany was less single-minded in her ideas. The mass of her people had been persuaded that the war was one of defence against a Pan-Slav peril and hostile encirclement by other Powers; but the bourgeois classes looked for *Weltmacht* in the shape of commercial and colonial expansion, while Bernhardi expressed the mind of Prussian militarists when he demanded three years before the war that "France must be so completely crushed that she can never cross our path again." Behind such ebullitions was a growing conviction in the Prussian mind that the Prussian system of government could not long maintain itself against social democracy without fresh tributes to the efficacy of the sword. "This danger," wrote Prince von Bülow, "must be faced and met with a great and comprehensive national policy under the strong guidance of clear-sighted and courageous governments, which whether amicably or by fighting can make the parties bow to the might of the national idea." "Nor," concluded Bernhardi, "must we think merely of external foes who compel us to fight. A war may seem to be forced upon a statesman by the condition of home affairs." To Austria the compulsion came from the attitude of Yugoslavs within her borders; and her original war aims probably did not extend beyond the reduction of Serbia to dependence and the consequent eclipse of Russian prestige in the Balkans. For Belgium and for Serbia the object of the war was primarily self-defence; although in Serbia's case successful self-defence would inevitably bring with it the prospect of increased influence in the domestic affairs of the Habsburg Empire. Japan was bound to intervene by her alliance with Great Britain, but a positive inducement to fulfil its terms was held out by the opportunity of conquering Kiaochow and excluding Germany from Far Eastern waters.

Not much choice had in fact been left to these original combatants by the circumstance of past policy which had driven them into the war. Other Powers had freer hands and a market in which they could sell their alliance to buyers who would bid high. They could intervene or hold aloof, and the nature and extent of the price they set on their services would modify the war aims of those whose cause they espoused. The course, the objects, and the end of the war were profoundly affected by the gradual expansion of the hostile groups.

The leading part played by Germany in the movements which precipitated the outbreak is emphasized by the fact that Austria, having declared war on Serbia on July 28, remained at peace with all other States for several days after Germany had drawn the sword. It was not until Aug. 6 that Austria declared war on Russia, nor until the 10th and 12th that France and Great Britain declared war upon her, nor until the 27th that she declared war on Belgium, the German invasion of which had dragged in Great Britain three weeks before. So far as Austria was concerned, the Triple Alliance had been purely defensive, and it had not even bound her to defend Germany against France, unless Russia also intervened. Italy, on the other hand, had been bound to assist Germany against a French attack; and the legends about French aggression, which Germany propagated in the early days of Aug., were meant for Italian as much as for British consumption. Italy had, however, under wise guidance, refused to believe in French aggressiveness, and had declared her neutrality on Aug. 1 on the ground that her intervention was not required by the terms of the Triple Alliance. Her abstention on this occasion was probably the greatest service she rendered to the Entente during the war, for it released from the Franco-Italian frontier some hundreds of thousands of troops without whose assistance the battle of the Marne could hardly have been won. Her example may also have been the last straw in the balance which determined Rumania, despite its Hohenzollern King and its Austrian alliance, to stand aloof from the struggle.

---

[1] For side-lights on conflicting national viewpoints in connexion with particular episodes, and for greater detail in regard to them—the accounts being still sometimes irreconcilable as between representatives of the different countries concerned,—see the separate historical articles under country headings: especially ENGLISH HISTORY, UNITED STATES (*History*), AUSTRIAN EMPIRE (*Foreign Policy*), GERMANY (*History*), FRANCE (*History*), ITALY (*History*), JAPAN (*Foreign Relations*), SERBIA (*History*), YUGOSLAVIA (*History*), CZECHOSLOVAKIA (*History*), GREECE (*History*).

The Neutral States.—Neutrality was expected from the other European States, whatever their sympathies might be. Holland's traditions were more friendly to Germany than to Belgium, but they were obliterated by the wanton invasion of Belgium's neutrality, and Bethmann Hollweg's argument that a German annexation of Belgium would be useless without the acquisition of Dutch territory was not calculated to assuage alarm. But more immediate perils dictated Dutch neutrality. There was no reason to suppose that Entente forces, which protected only a tiny corner of Belgium, could have saved a single acre of Dutch territory. Holland, with its wealth of capital and agricultural produce and its harbours, would have fallen an easy prey to Germany, while the remnants of its colonial empire might have gone the way the Cape of Good Hope and Ceylon had gone during the last occupation of Holland by an enemy of Great Britain. Holland was wise in its neutrality, and even the Entente probably benefited more by it than it would have done by Dutch intervention. It was certainly well for Great Britain that in 1917–8 German submarines had no Dutch ports for bases which could not be blocked as the exits from Bruges were in April 1918.

Denmark was in the like case, albeit with an ancient grievance against Germany in the wrongful detention of Danish Slesvig. But again, Denmark could not have been defended against German invasion, and Danish coasts and ports would have been invaluable to German submarines. Denmark, too, was wise to eschew belligerency and seek to develop its influence in conjunction with its Scandinavian colleagues. Of these, Norway sympathized with the Entente, and might, but for the fear of Sweden, have been driven by German piracy into war. Sweden's affections were more divided. The Labour party, led by Branting, was, if not pro-Entente, at least averse from intervention on Germany's side. But the upper and bourgeois classes were strongly German in sympathy and inclined to *activism* in that direction. This affection was partly due to cultural development, but more to a greater fear of Russia which had been aggravated by the fate of Finland and Russian designs in the Åland Islands. The Baltic was, like the Adriatic, the scene of a triangular duel; but the Russian menace in the Baltic was greater than the Teutonic menace in the Adriatic. Sweden's fears of Russia counterbalanced Danish and Norwegian grievances against Germany, and the Scandinavian States found a basis for neutrality in an equilibrium of antipathies.

Spanish neutrality was the resultant of similarly antagonistic domestic feelings. The King, with his English wife, was pro-Entente, but the Catholic and conservative upper classes were pro-German, while the democratic factions, hankering after revolution, took the opposite side. Portugal was, as it had been since its war of liberation and the marriage of Catherine of Braganza, an ally if not a pawn of England; and the prospective agreements which England and Germany had just made for the division of its colonies had not sufficed to transfer its allegiance from the one to the other beneficiary. No one expected Switzerland to abandon its neutrality; and the Balkans were left as the principal sphere of diplomatic competition. Greece had a Prussian Queen and a King who was a Prussian field-marshal, but a prime minister whose sympathies and confidence were whole-heartedly on the Entente side. Bulgaria, as a result of the Treaty of Bucharest in 1913, had no sympathies at all, but a comprehensive grievance against all her neighbours who had robbed her of the fruits of victory over Turkey, and against the Great Powers which had acquiesced in that spoliation. Her object was simply to discover the probable winner, and back it with all her resources in the hope of getting back all she could from the losers. For the moment she would wait and see.

Turkey was nearer to a decision. She had long been wooed by the Kaiser. In 1898 he had declared himself the friend of all Mahommedans, whose-soever subjects they might be; and the circumstance that, outside Turkey, they were mostly the subjects of Great Britain, Russia, or France gave point to his policy. The Turkish revolution of 1908 and the machinations of a so-called party of progress, led by Enver and Tal'at, made no difference to the growth of Turco-Teutonic affection. England had afforded but a half-hearted support against the Russian advance toward Constantinople; she had assisted in the liberation of Greece and the Balkans, and had helped herself to Cyprus and Egypt and other fragments of the dismembered Turkish Empire; and her friendship seemed but the nether millstone to the upper millstone of Russian aggression. Moreover, by August 1914 the antagonism between England and Russia, on which 'Abdul Hamid relied, had disappeared in an alliance in which, so far as the Near East was concerned, Russia would be the predominant partner; and the interpretation which Russia put on that entente was illustrated by a crown council held in St. Petersburg on Feb. 6 1914 to discuss the means for securing the Straits and Constantinople. The appointment of the German Gen. Liman von Sanders to reorganize Turkish forces was the retort which naturally commended itself both to the Turk and the Teuton.

The Turkish mind was, however, slow to move; it was no light matter to reverse the traditional policy of centuries and embark on war with a Power which had long regarded the maintenance of the Turkish Empire as one of the first of British interests. The Kaiser believed that he had Turkey in his pocket, but no one knew what her attitude would be. When the German admiral made for the Dardanelles with the "Goeben" and the "Breslau" on Aug. 8–9 his course was dictated by necessity and not by plan, and he was even prepared to force his way up the Straits if peaceful admission were refused. As late as the 5th the German embassy at Constantinople had reported that it was undesirable for him to arrive there yet. He was, however, received with open arms. Turkish opinion had been profoundly irritated by the commandeering of two Turkish dreadnoughts which had been built in British dockyards out of the proceeds of a patriotic Turkish loan; officers of the British Naval Mission in Turkey were superseded, and, in spite of the Grand Vizier's opposition, Enver, the Minister of War, was mobilizing Turkish forces for an attack on the Suez Canal. Plans for Anglo-French naval coöperation in the Mediterranean had to be abandoned and British ships detached to blockade the Dardanelles and safeguard the Red Sea, while troops were hurried from India to Egypt. Twice before the end of Aug. Sir Louis Mallet, H.M.'s ambassador at Constantinople, mooted the possibility of forcing the Dardanelles, but expressed the opinion that success was doubtful without military coöperation and that failure would be disastrous. He succeeded, however, in prolonging the resistance of the Grand Vizier to Enver's designs and in delaying the breach until toward the end of Oct.

Turkey's Entry.—By that time the German Government had determined to cut the Gordian knot of Turkish indecision. The western campaign was coming to a deadlock before Ypres, the first German attack on Warsaw had failed, and a great Austrian effort was being planned to punish Serbia for her success in resisting attacks in the Balkans. On Oct. 28 Souchon sallied out of the Bosporus into the Black Sea with the combined German and Turkish squadrons, and on the 29–30th he mined Sevastopol harbour, sank a transport, and bombarded Odessa, Theodosia, and Novorossisk. Souchon alleged that the transport was a minelayer laying mines in Turkish territorial waters; and while the rival parties were still discussing the rival versions, Russia, having in Sept. secured a neutrality engagement from Rumania which was not communicated to her allies, declared war on the 31st without their connivance. The British and French ambassadors had already been instructed to follow their Russian colleague; on Nov. 1 they left Constantinople, and on the 3rd Adml. Carden bombarded the forts of the Dardanelles. Russian precipitation had, however, only hastened the end. Enver's troops had long been on the march toward the Suez Canal, and on Oct. 27 British outposts at El 'Arish and Nekhl had been withdrawn.

The entrance of Turkey into the war as Germany's ally was the first great diplomatic success achieved by either of the belligerent groups, and it did more than anything else to extend the sphere of the war and to increase in particular Great Britain's anxieties and obligations. Britain had little contact with Austria, and not much more with Bulgaria. Even Germany, apart from her naval ambitions, presented few points of direct conflict; they arose indirectly, either through the menace to Britain's allies in France and Belgium, or through the doors which Turkey now opened to German penetration. These led so far and in so many directions threatening British interests that, as they were gradually revealed in 1914–5, it seemed to many that they represented the original motive of Germany's aggression. Through Turkish dominions lay the overland route not merely to India but to Egypt and E. Africa; and both paths were strewn with inflammable material. Britain ruled over something like half the Mahommedans of the world, and for many of them the Sultan of Turkey as Caliph was their head. Even more dangerous might Germany's propaganda, backed by German military success, become in the midst of other discontented elements in India and in Egypt. With these under German and Turkish influence, the ferment might spread throughout the greater part of Asia and of Africa. Even the sea routes, on which the life of the Empire depended, would become unsafe when threatened on their flanks; for the problem has not yet been solved of how to command the sea in distant waters against an enemy holding the neighbouring lands and using the submarine. More immediately the entrance of Turkey into the war imposed upon Great Britain the task of defending the naval position in the eastern Mediterranean, the route through the Suez Canal, Egyptian territory, the Persian Gulf and the overland route to India against Turkish and Arab attacks. Incidentally it cut off Russia from her least indirect and irregular communication with her allies. Fortunately, the action of Japan limited these anxieties and relieved the Entente of the greater part of the burden of eradicating German power in the Far East. A Japanese ultimatum, which had been expected a little earlier, was delivered to Germany on Aug. 15 demanding the unconditional surrender of Kiaochow; it expired on the 22nd, and next day Japan entered the war.

Turkey's intervention had an immediate effect upon the status of her former provinces held by Great Britain. Cyprus was annexed at once; a British protectorate was proclaimed over Egypt on Dec. 17 with the connivance of France, whose protectorate over Morocco was recognized by Great Britain on the 24th, and on the 18th the Khedive 'Abbas II., who had thrown in his lot with his Turkish suzerain, was deposed in favour of his uncle Husein, who further received the title of Sultan. Egyptian opinion accepted the change, and Turkey's efforts to reconquer her lost dominions were frustrated by the necessities of self-defence in the Dardanelles and on all her Asiatic frontiers. Before the Russians could move across the Caucasus, divisions of the Indian army had sailed up the Shatt al 'Arab and begun that chequered advance which led them from Basra to Mosul. Not the least of the political effects of Turkey's action was to bring India into the war to a far greater extent than would have been possible had British participation been restricted to European fronts. Over a million native Indian troops were eventually engaged, and they assisted materially in the conquest of Mesopotamia, Palestine, and Syria. Before long Arabia, too, turned against the Turks, and found in Turkey's participation in the war the opportunity to emancipate itself from Turkish rule.

Russia's Claims.—For the moment, however, these were unforeseen developments, and the more immediate effect of Turkey's intervention was to bring within the sphere of apparently practical politics ambitions which belonged to an older world. The breach which Russia had helped to precipitate opened up the prospect of giving effect to the deliberations of the Russian crown council of Feb. 6 1914. The subject was not apparently broached by Russia to her allies until they, for reasons of their own, had committed themselves to an enterprise which would render it possible for Russia to reap its fruits—unless, indeed, it was really with an eye to securing Constantinople and the Straits by means of allied efforts that Russia despatched on Jan. 2 1915 an urgent request for some diversion to relieve Turkish pressure in the Caucasus. This is not the place to trace the growth of the Dardanelles expedition, which after the premature bombardment of Nov. 3, was keenly taken up by Mr. Churchill. The political and strategical motives for it seemed adequate. There remained no flank to turn on the western front; an unbroken line of trenches stretched from the North Sea to the Alps; and neither side could break the deadlock. On the other hand, the flank might be turned by sea power operating in the Dardanelles, an enemy knocked out by the capture of Constantinople, communications restored with Russia, the Teutonic path barred to the East and to Egypt, and two if not three new allies found in Greece, Rumania, and Bulgaria, who uniting with Serbia and linking up Russia with a fourth potential recruit in Italy, might sweep upon Austria-Hungary and threaten an attack on Germany's southern frontiers which would destroy the bastions she had made on her eastern and western fronts.

Such was the prospect which Allied vision discerned and Russia proposed to convert into territorial substance. On March 4, when England and France had been committed to the enterprise, Russia handed in a memorandum to the British and French ambassadors at Petrograd, in which she explained her ideas. Most of what was left of Turkey in Europe, including Constantinople, the western shores of the Bosporus, of the Sea of Marmora, and of the Dardanelles, and Thrace as far as the Enos-Midia line, was to become Russian territory. So, too, were the islands in the Sea of Marmora, Imbros and Tenedos outside the Dardanelles, and the coast of Asia Minor from the Bosporus to the mouth of the Sakaria and across to the gulf of Ismid. On the other hand, the middle zone of Persia, declared neutral by the agreement of 1907, was to be assigned to the British sphere of influence, while Arabia was to become independent. By March 20 both the British and French governments had signified their assent to these proposals. Russia was still the predominant partner in the military alliance, her armies were overrunning the Carpathians and the Bukovina, and the anticipated collapse of Austria discounted the need to respect Balkan susceptibilities.

The agreement was secret, but Russian secrets had a habit of leaking out to her enemies during the war. Nor, indeed, did British or French politicians conceal their conversion to the justice of Russia's demands, while they ignored in their comments the impression it would produce upon wavering minds in the Balkans. The effect was to give Turkey the unaccustomed part of champion of Balkan independence; for with Russian ambitions fulfilled, no other Balkan power could have been more than a client State. Greece saw her aspirations—more legitimate at least than those of Russia—thwarted for ever by Allied complaisance; Bulgaria seemed to have struggled in vain under Stambolov to free herself from Russian tutelage, and to be doomed to perpetual servitude; Rumania lost hope of righting the wrong of 1878 and redeeming the Rumanians of Bessarabia; and only Serbia, which looked to the Adriatic, was content with this prospective Russian monopoly of the Black Sea and the Straits and dominance of the Aegean. The intervention of Turkey had given a predatory turn to the thoughts of the Entente; and, so far, the diplomacy of the war had tended to show an increasing disrespect for the liberties of little nations.

The war was not, however, making much progress on those lines. In the Near East Russia's difficulty lay not in securing her Allies' assent to her aspirations but in providing for their realization. This she was totally unable to do, and her contribution to the Dardanelles campaign, which was to have taken the form of a hundred thousand men landed on the N. coast of Thrace and a naval attack on the Bosporus, came to nothing. Great Britain and France were not merely to assent to Russia's schemes but to give them effect; and they were not such as would enlist support in the Balkans. Venizelos was apparently prepared to land two Greek divisions, but they would almost certainly have been inadequate, and it was more than Hohenzollern interests that prevented the embarkation. Bulgaria would have bowed to the accomplished fact, but no sane politician could have expected her to help Russia into Constantinople. The western Allies themselves were deeply committed to an offensive with their maximum force on the western front, and reluctantly doled out belated troops for the Dardanelles. So the ill-starred enterprise dragged on to its inevitable end. Success may sometimes redeem the worst of policies and plans, but the failure of the Dardanelles expedition precipitated the evils it had sought to prevent, drove Bulgaria into the enemies' camp, and handed the Balkans over to the Teutonic alliance.

Italy's Entry.—The next diplomatic move was more successful. The better mind of Italy had been shown by her refusal to acquiesce in an Austrian attack on Serbia in 1913 and to back up her Allies in Aug. 1914; and the tradition of Garibaldi and Mazzini had already inspired Italians to enlist under Ricci Garibaldi for service in France. The gibe of the French diplomatist that Italy would rush to the rescue of the conqueror was disproved by her quiescence when the Germans were at the gates of Paris; and popular Italian sympathies were undoubtedly stirred by the wrongs of Belgium and of Serbia. But in Italy, as in other countries, there was at first a hiatus between the soul of the people and the diplomacy of her government. It was Baron Sidney Sonnino who was mainly instrumental in negotiating the secret Treaty of London on April 26 1915. He had been convinced that Italy's interests required her intervention on the side of the Entente. He believed in a balance of power which Italy might turn to her own advantage. The seizure of Tunis by France in 1881, and fear lest the Mediterranean might become a French lake, had driven Italy into the Triple Alliance and the bosom of her hereditary Austrian enemy; and fear lest the Adriatic should fall under Teutonic domination if the Entente were defeated, and under Yugoslav influence if it won, drove Sonnino in 1915 out of the refuge of neutrality. In either event it was only by Italian belligerency that the situation could be redressed in Italy's favour; and Sonnino's calculations were that, if the war did not end in a decisive victory, Italy would probably get more out of a semi-victorious Entente than out of a semi-victorious Germany. Germany might, indeed, throw the Habsburg dominions into the melting pot as part of a general liquidation, and recognize Yugoslav independence; but she would keep Trieste for herself and Fiume for Hungary, which would be worse for Italy than the *status quo*.

Better terms could be obtained from the Entente, and Sonnino sought a fulcrum for his bargain in the concessions he demanded from Austria. Both Austria and Italy were pledged to the principle of reciprocal compensation in case either was forced to disturb the *status quo* in the Balkans. Austria argued that the invasion of Serbia involved no permanent territorial change; but Sonnino retorted that during the Turkish-Italian War Austria had declared that an Italian bombardment of the Dardanelles or even the use of searchlights against the Turkish coasts would constitute a claim for Austrian compensation. In March 1915 Burian admitted the principle of the Italian claim, and under pressure from Germany conceded the Trentino to avoid a breach. But there was no guarantee that the concession would be regarded as binding in the hour of victory, nor would Burian budge an inch with regard to Gorizia, Trieste, the Dalmatian islands, or Valona. Sonnino had naturally less compunction in demanding from the Entente Powers their recognition of acquisitions to be made at the expense of their enemy than he had in requiring the surrender of territory from his ally; and in the Treaty of London, signed on April 26 1915, he made full use of this opportunity. To the Entente it seemed that victory was all that mattered, and victory appeared to be doubtful without Italian assistance. It was useless to talk about placing the rights of the smaller nationalities upon an unassailable foundation if insistence upon all those rights prevented any foundation at all. Nor apparently did any of the Entente governments appreciate at that time the view which the smaller nationalities involved in the bargain took of their rights.

The complete dissolution of the Austro-Hungarian Monarchy was not then, declared Salandra four years later, considered as a possible war-aim; and it was under the impression that peace would still leave the Habsburg Empire a formidable foe to Italy that the Entente agreed to the terms which ultimately threatened to break up the Peace Conference in 1919 and provoke a fresh war between Italians and Yugoslavs. Thus Italy was to receive the Trentino up to the Brenner Pass; this would give her all the advantages of a strategic offensive against Austria which Italy complained that Austria had possessed against her, and would subject to Italian rule a quarter of a million Germans. She was to acquire Istria, including Gorizia, Trieste, and Pola, but not Fiume, and western Dalmatia including the harbours of Zara and Sebenico, a protectorate over central Albania and the sovereignty of Valona. The Adriatic would thus become an Italian lake. In the E. Mediterranean she was to have entire sovereignty over the Dodecanese which she had occupied since the Turco-Italian War, and in the event of a complete or partial partition of Turkey was to receive the province of Adalia and its adjacent littoral. She was to be compensated for any British and French colonial expansion in Africa by similar extension of territory in Eritrea, Somaliland, and Libya, and to be paid a share in the war indemnity corresponding to her sacrifices. The signatories were pledged to secrecy and to support Italy in opposing papal participation in the negotiations and settlement of peace. Italy in return undertook to wage war with all her resources against all the enemies of the Entente, to commence hostilities within a month, and to sign the declaration of Sept. 5 1914 by which the Allies engaged to make no separate peace. But while she denounced the Triple Alliance on May 3 1915 and declared war on Austria on the 23rd, she did not announce her adhesion to the pact of Sept. until Nov. 30 and remained at peace with Germany until Aug. 27 1916. Salandra subsequently claimed this delay as an important service rendered to his country, and Tittoni justified it on the ground that no date had been specified in the treaty, although her Allies in giving their consent to it noted her declaration that she would "actively intervene at the earliest possible date, and at any rate not later than one month after their signature."

The secrecy of the treaty exonerates the Italian people from the charge of being actuated by its materialistic motives when they enthusiastically supported intervention in May 1915 and defeated Giolotti's attempt to drive Salandra from power. But the treaty was soon revealed to the Yugoslavs with results which materially helped the Austrian cause. Great indignation was expressed during the Peace Conference of 1919 at the admission of Yugoslavs to plead their cause, and the Italian premier Orlando exclaimed that it would be as proper to call in the Germans, since Slovenes and Croats had fought throughout the war on Austria's side. But some at least of their persistence was due to the Treaty of London, which proposed to transfer hundreds of thousands of them merely from a familiar to an unfamiliar alien domination. The upshot was largely to reinforce the small pro-Austrian party among the Yugoslavs, and to place obstacles in the way of Italy's march to Trieste. Similarly deterrent was the effect of the Italian claim to the purely Greek Dodecanese and her Albanian pretensions upon the popular mind in Greece. Italy was not, however, alone to blame. On the eve of her decision a Pan-Slav society in Petrograd adopted and published abroad a resolution to the effect that in view of Russia's victorious progress across the Carpathians the projected Italian intervention was belated and undesirable; and the first use which Serbia made of the promised accession of strength was, as soon as Italy was at war, to dash across to the Albanian coast where Serb and Italian ambitions conflicted. It was not the imperialism of Italy which delayed the intervention of Rumania, to whom an Entente loan had been guaranteed three months before; nor was it the ineffectiveness of Italy's attacks across the Isonzo. It was the military defeat of Russia in Galicia and Poland, and Great Britain's failure in the Dardanelles, that provoked the next accession of strength to the enemies' cause.

Bulgaria's Entry.—Bulgarian neutrality had always been precarious, and the Government itself had difficulty in restraining its irregulars and *komitajis* from raiding the Serbian frontier. A serious affray of this sort occurred on April 1 at Valandova while King Ferdinand was still waiting upon events, but by July the Russian *débâcle* in Galicia and the British failure to make much advance in the Dardanelles convinced him that Germany would win, and on the 17th a treaty was concluded which offered Bulgaria, in return for her intervention, the whole of Serbian Macedonia and Albanian Epirus; she was also allowed to extort from Turkey a strip of territory along the Maritsa controlling that river and Adrianople. Belated efforts had been made to buy off this new enemy, but it was not until Aug. 23 that the Serbian *Skuptshina* was brought to recognize "the sacrifices indispensable for the preservation of the vital interests of her people." They would have preferred more heroic measures, and in vain begged the Entente to authorize a Serbian attack on Bulgaria before the latter got her blow in first. The normal correctitude of the Entente was reinforced by the fact that Serbian aggression would release Greece from her treaty obligations to assist Serbia if attacked by Bulgaria. It did not foresee the autocratic dismissal of Venizelos by Constantine on Oct. 6, the acquiesence of the Greek parliamentary majority, and Constantine's repudiation of his treaty obligations when Bulgaria took the offensive. It was carefully synchronized with Mackensen's invasion from the N.; and, taken on two fronts, Serbia was in a desperate position. The British and French troops hastily transferred from Gallipoli to Salonika were too late even to assure the Serbs a retreat down the Vardar; and they had to make their perilous way across the trackless and snow-clad mountains of Albania to the inhospitable shores of the Adriatic. The outposts followed the centre of the Entente position in the Balkans; Montenegro was overrun by Austria; and the British evacuated Gallipoli, keeping Salonika as a thorn in the enemy's side and a bridle on Greek vagaries.

Christmas, 1915, marked the climax of German success in the war. She had easily held her western front with inferior forces against wasteful and premature Allied attacks, while she conquered Galicia and Poland, and with Bulgarian help overran Serbia and made a corridor to Turkey and the East. Von der Goltz was already in Mesopotamia organizing the Turkish forces which saved Bagdad from Townshend in Nov. 1915 and then captured his army in Kut in the following April; while Egypt had to withstand Arab attacks on the W. and Turkish attempts in the Suez Canal. But it needed a longer and stronger arm than even Germany possessed to strike with much effect across the torpid body of the Turkish Empire and the sands of Syrian and Arab deserts. Russia more than atoned for the British failure before Bagdad by the rapid and brilliant seizure of Erzerum in Feb. 1916, and then pushed on S. to Mush, Bitlis, and Van, and W. to Trebizond. On June 7 the Grand Sherif of Mecca threw off his allegiance to Turkey, occupied Jidda and Yambo', laid siege to Medina, cut the Hejaz railway and was joined by tribes farther S. who captured Aunfuda; on Dec. 16 he was recognized as King of the Hejaz by Great Britain. Between March and Sept. Smuts conquered nine-tenths of German E. Africa, while Portugal threw in her lot with Great Britain to assist in the campaign; and, although the week after the fall of Kut did not seem a happy moment for the conclusion of the Sykes-Picot Agreement of May 9 1916, its arrangements for British, French, and neutral zones in Mesopotamia, Syria, and Palestine were intelligent anticipations of the future. Germany's oriental visions were unsubstantial, and her Balkan allies would not be much help toward a decision on the western front. She had merely secured immunity for her eastern frontiers and relief from fear lest Austria should collapse, while she turned her forces once more to the W. for a blow at the heart of France before the first serious Allied offensive matured. The Marne had taught her the risks of the far-flung line, and she now selected the shortest route to a vital spot at Verdun.

Rumania's Entry.—France saved herself in the titanic conflict which followed; but Germany, too, was hardly less successful in her resistance to the Franco-British attack on the Somme, while with her left hand, so to speak, she bolstered up Austria's stand against the unexpected and vigorous assaults which Brusilov launched in July, and then crushed Rumania when on Aug. 27 the fifth Balkan state ventured into the turmoil of war. Rumania, long shivering on the brink, chose an unfortunate moment to plunge. Her case was a replica of Italy's; there was a *Romania iridenta* (as the Rumanians spell it) across the Carpathians, subject to worse treatment from Magyars than unredeemed Italy suffered at Austria's hands. There were also strategic frontiers to be rectified, and a semi-circular state to be rounded off. By the secret treaty with Rumania which was signed by Italy, France, Great Britain, and Russia, Rumania was to receive the Banat, the whole of Transylvania, a large slice of Hungary up to a line from Szeged on the Theiss through Debreczen to half-way between Csap and Szatmar-Negeti, as well as the Bukovina up to the Pruth, "the most ethnically unjust of all the secret agreements made during the war,"[1] which only the subsequent and separate peace of Bucharest in May 1918 released the Allies from their obligations to enforce. Nothing was naturally said about the Rumanes under Russian rule in Bessarabia or Bulgarians under Rumanian sway in the Dobruja. The treaty had been drafted on Aug. 8, but Stuermer objected that the Great Powers must not be bound to continue the war until all Rumania's territorial aims had been achieved, and Briand agreed to waive the point. Bratiano, however, threatened to resign, and on Aug. 12 the Tsar apparently yielded. The Allies were to advance from Salonika on the 20th and Rumania to declare war on the 27th.

Sarrail's plans had, however, been betrayed by two of his officers, and it was not until Sept. 7 that he could move. Rumania kept to her bond, and attacked Transylvania on Aug. 28. Her subsequent disasters were attributed to her neglect of Entente counsels and wishes in attacking Transylvania instead of Bulgaria; but the criticism was unjust. There was apparently no stipulation about the direction of Rumania's action, and she had hopes that Bulgaria might not intervene. Justification for aggressive war must always be found in a political and not a strategical motive. Rumania had a legitimate grievance against Austria-Hungary in the treatment of *Romania iridenta;* she had none against Bulgaria whom she had robbed in 1913. Even on strategical grounds her conduct might be defended; her ruin was wrought, not by Bulgaria, but by Falkenhayn's Austro-German attack through the passes, and their progress would have been even more rapid had Rumania launched her armies against Bulgaria. She might have withstood Falkenhayn, had Russia done her duty and sent adequate forces into the Dobruja to oppose Mackensen and carry out the threats she had uttered against Bulgaria in 1915, while Rumanian neutrality barred their execution. The Entente Powers had, in fact, simply looked to Rumania to pull their chestnuts out of the Balkan fire; they had no idea that the battle of the Somme had left Germany in a condition to make an effort elsewhere like Falkenhayn's; while the creeping paralysis which had overcome Russia suggested the tale of a secret understanding between her ambiguous Premier Stuermer and the Habsburgs to partition Rumania, Wallachia to go to the Habsburgs and Moldavia to Russia. Before the end of the year Bucharest had been captured and the Rumanian armies driven behind the Sereth, while Sarrail's offensive in the S.W. barely reached Monastir. From the Aegean to the Carpathians, and from the Adriatic to the Black Sea, the Balkans had become a solid Teutonic block.

Peace Moves, 1916–7.—The moment appeared favourable for Germany to make overtures of peace. The Kaiser had discussed the idea in a letter to his Chancellor, Bethmann Hollweg, at the end of Oct.; on Dec. 12 a note was addressed to President Wilson and the Pope, and the matter was made public in the Reichstag. The note was based on Germany's success; she and her allies, it declared, "have given proof of their indestructible strength. . . . Their unshakeable lines resist ceaseless attacks. . . . The latest events have demonstrated that a continuation of the war cannot break their resisting power. The general situation much rather justifies their hope of fresh successes." These they would forego for the sake of peace. "They do not seek to crush or annihilate their adversaries" and "they feel sure that the propositions which they would bring forward . . . would be such as to serve as a basis for the restoration of a lasting peace." These they did not specify; nor, indeed, had they made up their minds on the point. Eighteen months earlier the "Six Associations" representing German industry and commerce had demanded as conditions of peace "a colonial empire adequate to satisfy Germany's manifold economic interests," the military and economic control of Belgium, the annexation of the French coast and its hinterland from the Belgian frontier to the Somme, of Briey, Longwy, Verdun and Belfort, of "at least parts of the Baltic provinces," and had declared that the surrender of any occupied territory "in which so much German blood has been spilt and so many of our best and noblest have found a grave, would do violence to the sentiments of our people and to their conception of an honourable peace." Bethmann Hollweg would not have countenanced such preposterous demands; but Ludendorff was more influential, and in vaguely describing the terms which alone reached the enemy with his approval, he uses phrases which might be made to cover them all except the annexation of the Channel ports and their hinterland.

---

[1] *History of the Peace Conference*, i. 184.

Whatever their official conceptions of peace, the Teutonic allies dared not avow them in public, and the absence of substantial proposals convinced their opponents that the note about peace was a mere manœuvre of war, a continuation of the German offensive designed to complete the disintegrating work of German arms and to break up the Entente by playing off one Power against another. Consciousness of the real perils of such a conference gave an angry tone to the note in which the Entente replied on Dec. 29, and it consisted of a comprehensive indictment of Germany's conduct during the war, with particular reference to Belgium, and of a categorical refusal "to entertain a proposal which was devoid alike of sincerity and of substance."

Almost simultaneously but quite independently President Wilson addressed an inquiry to both belligerent groups on Dec. 18. He admitted that he was embarrassed by the coincidence because his note "may now seem to have been prompted by the recent overtures of the Central Powers," and the popular voice in Entente countries was convinced that he was "playing Germany's game." Clearer sighted observers discerned in it the President's first step toward intervention on the Entente side. It was, in effect, a request for information about the intentions of the belligerents, and resembled the inquiry which Great Britain addressed to France and to Germany with respect to Belgium's neutrality. The answers then determined British intervention, and the answers to Wilson's note helped him to make up his mind, or rather that of his people. "What," he asked, "did the two sides mean by the general terms they used of the war? The concrete objects for which it is being waged have never been definitely stated. The leaders of the several belligerents have . . . stated those objects in general terms. But, stated in general terms, they seem the same on both sides. Never yet have the authoritative spokesmen of either side avowed the precise objects which would, if attained, satisfy them and their people that the war had been fought out. The world has been left to conjecture what definitive results, what actual exchange of guarantees, what political or territorial changes or readjustments, what stage of military success even would bring the war to an end." Germany brushed aside the request on Dec. 26 by reaffirming her contention that a direct exchange of views between the belligerents was "the most suitable way of arriving at the desired result," and proposing "the speedy assembly, on neutral ground, of delegates of the warring States."

The Entente reply was more considered and was not completed until Jan. 10 1917. Demurring to the President's "assimilation" of the two belligerent groups, the Allies expressed their disbelief in the possibility at the moment of attaining "a peace which will assure them reparation, restitution, and the guarantees to which they are entitled by the aggression for which the responsibility rests with the Central Powers." They proceeded to indicate as their objects the restoration of Belgium, Serbia, and Montenegro with indemnities; the evacuation of the invaded territories of France, of Russia, and of Rumania with just reparation; the "reorganization of Europe"; the "restitution of provinces and territories wrested in the past from the Allies by force or against the will of their populations; the liberation of Italians, of Slavs, of Rumanians, and of Czechoslavs from foreign domination; the enfranchisement of populations subject to the bloody tyranny of the Turks; the expulsion from Europe of the Ottoman Empire." In a covering despatch dated Jan. 13, which was one of the most important and effective State papers of the war, Mr. Balfour demonstrated that "a durable peace can hardly be expected unless three conditions are fulfilled. The first is that existing causes of international unrest should be, as far as possible, removed or weakened. The second is that the aggressive aims and the unscrupulous methods of the Central Powers should fall into disrepute among their own peoples. The third is that behind international law and behind all treaty arrangements for preventing or limiting hostilities some form of international sanction should be devised which would give pause to the hardiest aggressor." It would, perhaps, be hyperbole to call Mr. Balfour the author of Mr. Wilson's policy, but its future outlines could hardly have been more accurately indicated.

Germany's first "peace offensive" had failed, to the deep disappointment of her people and her Government. Her situation was, indeed, imposing rather than substantial. Apart from a corner of German E. Africa, her colonies had all been lost; the battle of Jutland had terrified her high seas fleet into ignominious inaction; and on the western front Hindenburg had prepared a comprehensive retreat. In Oct. the *Vorwärts* had been suppressed as a minority Socialist organ and subjected to official inspiration. Ominous creaking began to be heard in the joints of her Austrian ally. Francis Joseph had died on Nov. 21, giving place to the more pacific Charles, and the murder of Count Stürgkh on Oct. 27 was followed by a rapid succession of three prime ministers in Dec. and by the substitution of Czernin for Tisza's henchman Burian as Foreign Minister. Peace had become a popular aspiration, and when the Allies rejected the offer, astonishment mingled with consternation. "*Jetzt ist alles verloren,*" exclaimed a German officer interned in the Engadine. Nor did the opening months of 1917 belie this gloomy German forecast. The German retreat to the Hindenburg lines, sound enough in itself, depressed a public accustomed to judge by the map. Sir Stanley Maude's spectacular conquest of Bagdad gave a sinister turn to the Berlin-Bagdad vision. Sir Archibald Murray was at the gates of Gaza, and, if Maude's campaign were a precedent, would soon be in Damascus. Above all there loomed the threatened breach with the United States, which would make the ultimate defeat of Germany inevitable save by a miracle. Corresponding elation appeared on the Entente side; even sober critics thought that the war would soon be won with the substitution of Mr. Lloyd George for Mr. Asquith in Dec., and in Jan. 1917 a highly successful "Victory" loan was launched in England on the basis of triumph within eight months.

Allied War Aims.—Prospective victors made haste to divide the contingent spoil. France demanded, and Russia agreed, on Feb. 14 1917 to the Rhine as "a permanent strategical frontier against a Germanic invasion." Besides the restoration of Alsace-Lorraine, the new boundaries were "to be drawn up at the discretion of the French Government so as to provide for . . . the inclusion in French territory of the entire iron district of Lorraine and of the entire coal district of the Saar valley." The rest of the territories on the left bank of the Rhine were to be separated from Germany, constituted an autonomous and neutral state, and garrisoned by French troops until all the conditions of peace had been completely satisfied. Mr. Balfour on Dec. 19 1917 affirmed that the British Government had never desired, encouraged, or approved of this idea; but it was publicly advocated by one of his colleagues in the Cabinet. In return Russia insisted upon, and France recognized, Russia's "complete liberty in establishing her western frontiers." The meaning of this had been specifically explained by Sazonov a year earlier, on March 9 1916: "It is particularly necessary to insist on the exclusion of the Polish question from the subjects of international discussion and on the elimination of all attempts to place the future of Poland under the guarantee and the control of the Powers." Since that date, the Central Powers had, on Nov. 5 1916, proclaimed the independence of Russian Poland, and on the 15th the Tsar issued an ambiguous statement to which Mr. Asquith and M. Briand endeavoured to give a precise interpretation. In his general order for Christmas Day, the Tsar did, indeed, refer to a "free Poland," and the Allied note of Jan. 10 1917 averred that his intentions had thereby "been clearly indicated." But an imperial commission, appointed to determine what was meant by the phrase, narrowed it down in Feb. 1917, as Gourko relates, on the ground that "a free Poland would fall under Germany's influence." Others of Russia's imperialistic aims had been recognized in the spring of 1916, at the time of the Sykes-Picot Agreement about Syria and Mesopotamia, and she had secured Erzerum, Trebizond, and Turkish territory as far as a line running through Mush, Sert, Ibn 'Omar, and Amajia to the Persian frontier. On July 3 1916 by a treaty which was to be "kept in complete secrecy from everybody except the two high contracting parties," Russia and Japan had bound themselves to safeguard China "against the political domination of any third Power entertaining hostile designs toward Russia or Japan"; and in Jan.–Feb. 1917 the Entente Powers, by another secret treaty, recognized the concessions which Japan had extorted from China on May 7 1915 by means of an ultimatum. Japan thus became the territorial if not the spiritual heir of Germany in the Shantung peninsula and acquired a lien on China's economic development.

The opening of the campaign of 1917 proved, however, delusive, and its later stages postponed to an indefinite future the realization of these secret agreements. The Hindenburg lines justified the hopes the Germans had placed upon them; and while the British won a considerable success at Vimy, the French effort in Champagne and along the Chemin des Dames was a costly and disastrous failure. The German submarine campaign was hardly less disastrous to the shipping upon which Great Britain and her Allies relied for their ability to continue the war; the British offensive in Flanders was a depressing disappointment, and Murray failed to force the gates of Palestine. The doubtful success of Entente arms corresponded to the dubious methods and aims of its diplomacy; and a candid survey of the secret agreements, to which the Entente Powers had committed themselves, suggests a serious doubt whether, if victory had been won early in 1917, it would have been worth the winning or would have resulted in a happier world than that which had existed before the war broke out. Not all of the Powers were, indeed, committed to all of the agreements; but each of them had staked out claims for new conquests and fresh subject-peoples, and not one had proposed to sacrifice a single acre on the altar of self-determination. Nor, in the hour of imperialistic victory, would it have been British or American statesmanship which would have interpreted the "freedom" of Poland, the "autonomy" of Germans on the Rhine, the rights to self-government claimed by Czechoslovaks, Dalmatians, or Armenians, or the liberties of little nations in the Balkans or the Baltic. There would, in the event of victory early in 1917, have been no League of Nations, no "minorities clauses," no mandates, no guarantees for better domestic rule by states or better regulation of their external affairs. Russia might even have remained an autocracy fortified by success, and the Tsar have supported the cause of autocracy in Germany and in Austria. Cruel as were the sacrifices exacted from the western Powers by the deferment of hope and by Russia's collapse, criminal as were the means by which the Bolsheviks imposed their new tyranny upon the Russian people, the destruction of Tsardom may seem to have been in the long run the greatest service Russia rendered in the war. No one would claim perfection for the work of the Peace Conference of 1919, but what sanity it showed was mainly due to the fact that the one autocracy in the Entente had disappeared and its place in council had been more than filled by the great republic of the West. The diplomatic atmosphere was purified by the change, and power shifted towards an idealistic left. Great Britain, instead of representing as hitherto the extreme of moderation, presently found herself holding the balance between France, which, with the elimination of Russia, came to represent the right of annexation, and the United States, which ultimately put two million men in the field and did not ask for an acre in return. Gradually a programme was evolved which did not require the veil of secret diplomacy; a reformed band of Allied and Associated Powers gathered behind its banner of freedom most of the democracies of the world; and the war entered on a course which made a fight to a finish a rational policy.

The Russian Revolution.—The Russian revolution and American intervention together form the turning point of the war even more from the diplomatic than from the military point of view. But the one was needed to complete the other: without the revolution American intervention would still have left the Entente with a dubious face and a divided mind; without American intervention the Russian revolution would have robbed the Entente of its victory. Nevertheless, the coincidence of the two events appears to have been accidental. The revolution came first by some three weeks, and the Ides of March were fatal to the Russian Caesar. Its effects upon the war developed step by step with the progress of internal change, but from March 1917 fighting almost ceased upon the Russian fronts. The Cadet party, which was led by Miliukov and controlled the Provisional Government, would have continued the war for the sake of the Straits and Constantinople; it was straightforward on Poland, and on March 30 frankly recognized its independence. But power passed more and more into the hands of the Soviets, who wanted a general peace which would give each nation what it possessed before the war and each proletariat a good deal more. There were to be "no annexations and no indemnities," save such as each proletariat was entitled to levy upon its own capitalists and bourgeoisie. For this purpose the Soviets on May 12 proposed an International Labour Congress at Stockholm and on the 30th invited the Allies to restate their war aims. But even the Soviets did not yet demand a separate peace, and while on April 10 Russia renounced her imperialistic aims, on the 15th Czernin's offer to that effect was declined.

On May 13, however, the Russian Provisional Government fell, and Kerensky became the leading spirit in a new and more socialistic administration. He believed that only the success of Russian arms could guarantee the orderly progress of the revolution, and did his best to withstand the propaganda of the Bolsheviks, who were destroying discipline, urging peasant soldiers to go home and garner the fruits of the revolution in the shape of the land, and denouncing the wickedness of Russians killing their brother German socialists. Lenin's Bolshevik insurrection on July 16 was suppressed, but the miasma of his doctrine proved fatal to Kornilov's spirited offensive in Galicia; and as soon as the Germans counter-attacked, Russian troops threw down their arms and fled, massacring the officers who sought to stop them. By the end of July Russia had lost all her gains in Galicia; in Aug. a similar riot in the Russian contingent in Rumania nearly ruined the latter's gallant resistance which defeated the Germans at Marasheshti; in Sept. the Germans forced the Dvina and captured Riga, and in Oct. occupied Oesel, getting into touch with Finland. Kerensky now became a convert to the necessity of a dictatorship, but repudiated Kornilov when on Sept. 7 he moved troops on Petrograd to effect it; and on Nov. 7 another Bolshevik insurrection transferred the dictatorship to Lenin and Trotsky, who began *pourparlers* for peace.

Russia had gone effectively out of the war faster than the United States came in; but she left a blazing trail behind her, and sparks from the conflagration started a smouldering fire on German soil which was never extinguished. Bolshevik pacifism seemed a ridiculous gesture in face of Prussian arms, but its moral effect was by no means contemptible. "Looking back," writes the archmilitarist Ludendorff, "I can see that our decline obviously began with the outbreak of the Revolution in Russia." After all, the original ground or pretence upon which the war had enlisted democratic support in Germany was its appearance as a war of defence against autocratic Pan-Slavism. When Russia had destroyed the Tsardom, repudiated its aims, and laid down its arms, Germans who were not militarists or capitalists might well ask for what they were fighting; and on June 27 Hindenburg pointed out to the Kaiser the decline in German *moral*. So, while the elimination of Tsarism gave greater reality to the moral claims of the Entente, it deprived those of the Central Powers of their substance; and the war became more nakedly a struggle between militarist imperialism and democratic idealism. A practical illustration was afforded by the formation of a Polish army in Russia and a Polish legion in France at the moment when the Polish legion in Austria had to be disbanded.

Czernin seems to have been the first among Teutonic statesmen to realize the change in the position and to seek to capitalize a situation in which the Habsburg Empire had nothing more to gain and everything to lose. Her soil was now rid of the Russian invader; Italy had made no serious impression, and Trieste was in no danger; Serbia only existed in exile, and Rumania trembled on its brink. On the other hand, the prolongation of war and Russian contagion might stir a series of domestic revolutions. Hence his conference with Bethmann Hollweg on March 27, his offer of peace to Russia in April, and his suggestion that Germany should cede Alsace-Lorraine to France while Austria handed over Galicia to Poland with a view to the subjection of both to German control; hence, too, the meeting of the Austrian Reichsrat on May 30 for the first time since the war began.

Ludendorff placed his heel on these proposals, and Czernin then turned his attention to the German Reichstag, where a complicated struggle was waged between Ludendorff's militarists and Bethmann Hollweg's politicians, who were beginning to react to popular discontent and the effect of Russian developments. "Bethmann Hollweg and Czernin," writes Ludendorff, "were both completely obsessed by the Russian Revolution. Both feared similar events in their own countries." On July 6 Erzberger, who was perhaps in Czernin's confidence, opened the attack with revelations about the non-fulfilment of official hopes from the submarine campaign and demanded a "peace of understanding." On the 11th the Kaiser was constrained to sign a rescript promising universal, direct, and secret suffrage for Prussia after the war; as a set-off to this Bethmann Hollweg was forced to resign on the 13th, being succeeded by Michaelis, a mere official who said what he was told and contradicted himself when occasion or his superiors required it. Then on the 19th the Reichstag passed by 214 to 116 votes a resolution in favour of peace "without indemnities or annexations," which Michaelis accepted only "as he understood it." It was timed and tuned for the Stockholm conference, which German and Russian Socialists were allowed to attend, while British and French were not, and probably also for the Peace Note which the Pope launched on Aug. 1, and which France and England, being estopped by their secret agreement with Italy, left President Wilson to answer.

President Wilson's Policy.—From that time onward for two years President Wilson became the principal spokesman of the Allied and Associated Powers; but it appears that the Russian revolution had exercised so far a more potent influence on the Central Empires than the intervention of the United States. Russia was their immediate neighbour on a frontier of a thousand miles. America was four thousand miles away, and it was long a German delusion that American troops would be kept out of Europe by the same submarines on which Germany relied to bring Great Britain to terms; and to arguments not backed by mailed fists Germany was indifferent. She had made up her mind to take what risk there was when in Feb. 1917 she resumed her unrestricted submarine campaign; and that approaching resolve had helped to determine her simultaneous refusal to state her war-aims in response to the President's invitation.

The coincidence seems to have been largely a matter of accident. Originally elected President in 1912 by a minority vote owing to the split in the Republican party between Roosevelt and Taft, Mr. Wilson was reëlected in 1916 after a close contest in which neither of the opposing American parties had made war with Germany a plank in its platform; and without the prospect of an unprecedented third presidential term, Mr. Wilson enjoyed in his second a freer hand than any other democratic statesman. But he was obviously tied by the traditions and public opinion of a community diverse in origin, in interests, and in outlook, spread over vast areas, separated by thousands of miles from the European conflict, and inured to the idea of splendid isolation "We are," said President Wilson on March 5 1917, "a composite and cosmopolitan people. We are of the blood of all the nations that are at war." Action was impossible until there was some common measure of agreement in a heterogeneous people, and it was not easy to unite on a basis of intervention a Federal democracy whose one common principle in foreign policy was abstention from European quarrels. The Monroe Doctrine, as understood by modern interpreters, implied that the United States would resent and resist European intervention in a S. American war, however gross might have been the aggression, and however much it might have shocked the European conscience. So far as the Western Hemisphere was concerned, the United States claimed to be the keeper of the conscience of the world, and it thought that claim was only tenable so long as it washed its hands of conscience so far as Europe was concerned. Intervention on behalf of Belgian neutrality or even protest against its violation might open the door to retorts in kind and break down the quarantine which the democratic republic had sought to impose upon Old World infection.

But the war put the finishing touch to the obsolescence of the schismatic doctrine of two worlds and two human consciences. It was only a practicable dogma provided either that the United States kept not merely its conscience but its people, its capital, its commerce, and its shipping on its side of the Atlantic; or that the Old World observed those rules of international law and conscience which had commended themselves to the American people. In other words, so far from there being two worlds, the Old must accommodate itself to the New; and the most hardened believers in the Monroe Doctrine rebelled against the idea that Germany could indefinitely sink American ships and kill American citizens without provoking a war, which America could not wage without giving its conscience a passport to Europe. "As far as the United States is concerned," writes Dr. J. B. Scott, "the cause of its war with the Imperial German Government is the submarine . . . for the law could not be changed to suit the submarine." Nor was the Monroe Doctrine compatible with the enforcement of the American conception of the freedom of the seas or with the maintenance of neutral rights; and a long series of incidents convinced the American public that its cause could not be isolated. "The challenge," said President Wilson, "is to all mankind"; and when he intervened, it was not merely in defence of American rights but of a common humanity.

The outstanding episode in the slow and painful process by which the American people were brought to realize the dilemma between war and the surrender of their principles must be briefly indicated. A series of events, which, in the despatch of Secretary Bryan, the Government of the United States had observed "with growing concern, distress, and amazement," culminated on May 7 1915 when the "Lusitania" was torpedoed without warning, and 114 American and nearly a thousand other lives were lost; and on the 13th he intimated that his Government would not "omit any word or act necessary to the performance of its sacred duty of maintaining the rights of the United States and its citizens and of safeguarding their free exercise and enjoyment." But he resigned when acts seemed likely to follow words, and the President's second "Lusitania" note was signed on June 9 by Mr. Lansing. Bryan's resignation was not, however, without its effects; and the words continued while more American lives were lost in each succeeding month.[1] The most definite action was taken in Sept. against Germany's less powerful and less pernicious ally, when Dr. Dumba, the Austrian ambassador, was required to leave on account of his complicity in the intrigues of J. F. Archibald and other Teutonic agents. A graver crisis was reached with the torpedoing of the Channel steamer "Sussex" on March 24 1916. "The Government of the United States," wrote Mr. Lansing on April 18, "has been very patient. . . . Unless the Imperial Government should now immediately declare and effect an abandonment of its present methods of submarine warfare against passenger and freight carrying vessels, the Government of the United States can have no choice but to sever diplomatic relations with the German Empire altogether." On May 4 the German Government made some concessions, and as President Wilson expressed it on April 2 1917, "somewhat restrained the commanders of its undersea craft." The reason for its complaisance, given later on by Bethmann Hollweg, was that it had not yet sufficient submarines to carry out unrestricted submarine warfare effectively.

That time came with the beginning of 1917. The decision was taken on Jan. 9, and it was Germany's real answer to the President's note of Dec. 18. But it was based on a serious miscalculation. The German naval authorities thought it would compel Great Britain to sue for peace within six months, and Bethmann Hollweg has cast the responsibility for its effects upon them. Hindenburg's plea that the Chancellor failed to inform him of the impression it would produce in America is less convincing, for Ludendorff says that "we reckoned that the adoption of the submarine campaign would effect a favourable decision for us, at latest before America's new troops could participate in the war." So American intervention was anticipated and discounted. But eighteen months were yet to pass before American intervention took a form which was materially to disconcert Ludendorff's military calculations. For more than a year diplomatic relations had practically been severed between the United States and Austria-Hungary, and it did not at once appear that the resumption of unrestricted submarine warfare would be followed by more drastic American action with regard to Germany.

On Jan. 22, ignorant of Germany's decision, Mr. Wilson addressed Congress on the results of his note of Dec. 18, and sketched the conditions which would justify the United States in guaranteeing peace with a view to making it permanent.

> "In every discussion of the peace that must end this war it is taken for granted that that peace must be followed by some definite concert of power which will make it virtually impossible that any such catastrophe should ever overwhelm us again. . . . Such a settlement cannot now be long postponed. It is right that before it comes this Government should frankly formulate the conditions upon which it would be justified in asking our people to approve its formal and solemn adherence to a League of Peace. . . . No covenant of coöperative peace that does not include the peoples of this New World can suffice to keep the future safe against war. . . . It will be absolutely necessary that a force be created as a guarantee of the permanency of the settlement. . . . There must be, not a balance of power, but a community of power. . . . But the implications of these assurances . . . imply, first of all, that it must be a peace without victory. . . . Only a peace between equals can last. . . . And there is a deeper thing involved than even equality of right among organized nations. No peace can last, or ought to last, which does not recognize and accept the principle that governments derive all their just powers from the consent of the governed, and that no right anywhere exists to hand peoples about from sovereignty to sovereignty as if they were property. . . . Statesmen everywhere are agreed that there should be a united, independent, and autonomous Poland. . . . And the paths of the sea must alike in law and in fact be free. The freedom of the seas is the *sine qua non* of peace, equality, and coöperation. . . . The question of armaments, whether on land or sea, is the most immediately and intensely practical question connected with the future fortunes of nations and of mankind. . . . I am proposing, as it were, that all nations should with one accord adopt the doctrine of President Monroe as the doctrine of the world; that no nation should seek to extend its polity over any other nation or people . . . that all nations should avoid entangling alliances. . . . There is no entangling alliance in a concert of power. . . . These are American principles, American policies. We could stand for no others."

But while it was "inconceivable that the people of the United States should play no part in that great enterprise" of laying "afresh and upon a new plan the foundations of peace among the nations," the present war must first be ended, and the United States would "have no voice in determining . . . the treaties and agreements which would bring it to an end," only "in determining whether they shall be made lasting or not by the guarantees of a universal covenant."

American Intervention.—Such was the President's frame of mind when, nine days later, on Jan. 31, Bernstorff communicated Germany's revocation of its pledge of May 4 1916 and its decision to recommence unrestricted submarine warfare on Feb. 1. On Feb. 3 he simply and literally fulfilled his threat of April 18 and "severed diplomatic relations with the German Empire altogether." "I take it for granted," he said to Congress, "that all neutral governments will take the same course," but "we do not desire any hostile conflict with the Imperial German Government." On the 26th he pointed out that the caution of shipowners and consequent congestion of commerce "might presently accomplish, in effect, what the new German submarine orders were meant to accomplish, so far as we are concerned," and proceeded to arm American merchant ships; but he was "not now contemplating war or any steps that need lead to it. . . . War can come only by the wilful acts and aggressions of others."

It came with speedy steps. Germany denied the right of neutrals to use arms at all, and intimated that the armed guards placed on American merchant ships would be treated as pirates. "Armed neutrality," confessed the President, "it now appears, is impracticable." There had, too, been intercepted a note dated Jan. 19 from Berlin to Mexico, proposing in the event of war an offensive and defensive alliance between Germany, Mexico, and Japan, and the reconquest of Mexico's "lost territory in New Mexico, Texas, and Arizona"; and on April 2 Mr. Wilson advised a special session of Congress "to declare the recent course of the Imperial Government to be in fact nothing less than war against the Government and people of the United States." "We are," he had declared in his second inaugural address on March 5, "provincials no longer. The tragical events of the thirty months of vital turmoil through which we have just passed have made us citizens of the world. There can be no turning back." And now "the world must be made safe for democracy." "The great, generous Russian people have been added in all their native majesty and might to the forces that are fighting for freedom in the world, for justice, and for peace. Here is a fit partner for a League of Honour. . . . We have no selfish ends to serve. We desire no conquest, no dominion. We seek no indemnities for ourselves, no material compensation for the sacrifices we shall freely make. We are but one of the champions of the rights of mankind." The resolution was passed in the Senate on April 4 by 82 votes to 6, and in the House of Representatives on the 5th by 373 to 50, and on the 6th the President declared war. Austria was not included, but Tarnowski, Dumba's successor, had been refused recognition, and relations were suspended; on April 13 they were severed with Turkey.

The President's somewhat naïve assumption that all neutral governments would follow his lead into armed neutrality had been promptly belied; and all European neutrals excused themselves. They were even less likely to follow him into war; but New World States, which were more immune from the consequences, were more amenable to his example. Cuba declared war on April 7, and on the 8th Panama associated itself with the United States. Brazil broke off diplomatic relations on April 11, Bolivia on the 13th, and Guatemala on the 27th, Honduras on May 17 and Nicaragua on the 19th, Haiti on June 15, Costa Rica on Sept. 23, Peru on Oct. 6 and Uruguay on the 7th, and Ecuador on Dec. 9. Brazil declared war on Oct. 26, while the Argentine declared her benevolent neutrality on April 11: but Chile and Venezuela remained neutral without benevolence. The contagion, however, spread into the Eastern Hemisphere: Liberia severed diplomatic relations on May 8 and declared war on Aug. 7: Siam declared war on July 22, and China on Aug. 14. *Securus judicat orbis terrarum:* but the world of little States needed some security before it would pronounce judgment. Nevertheless, more than half the States of the world had now declared war on, or broken off diplomatic relations with, Germany and her three allies; the Entente had become a War League of Nations; and the peace that would be made in case of victory would represent the judgment of the world and be very different from that contemplated in the secret agreements.

---

[1] See a provisional list of these and other crimes in J. B. Scott, *Diplomatic Correspondence*, pp. ix.–xv.

But there was a yawning gulf between judgment and execution, and a painful interval between the President's declaration and the time when, in Ludendorff's words, "America became the decisive power in the War." Financial coöperation began to relieve the strain at once, and naval coöperation to ease the submarine situation in May; and at the end of June the so-called "sentimental Division" arrived as an earnest of what was to follow on the field of battle. But as late as March 1918 there were only five American divisions in France, of which two were untrained; and meanwhile the endurance of the European Allies was sorely tried. The French army was seriously demoralized by the failure of Nivelle's offensive, and Caillaux began to undermine its political fortitude. The sinking of 25% of British merchantmen at sea in April was an almost more fearful menace; Russia had become a broken reed; the British campaign in Flanders proved a disappointment; Stockholm was holding out the lure of a "peace by negotiation" to Labour: Mr. Henderson resigned from the British Cabinet on Aug. 11; the Pope had appealed on the 1st for a peace on the basis of the *status quo*, disarmament, and arbitration; and tentative discussions were proceeding by more or less authorized agents in Switzerland. Michaelis secured an equivocal answer to the Pope's note in his effort to please both his militarist and his parliamentary masters. But the situation in Germany was as equivocal as its Chancellor: for while at the end of Oct. he was replaced by Hertling, a *persona grata* to the Pope as the first Roman Catholic Chancellor of Protestant Germany, for receding from the July resolutions, Germany was receding quite as fast with the apparent improvement in her military situation. "The future will show," declared Czernin after the Armistice, "what superhuman efforts we made to induce Germany to give way. That all proved fruitless was not the fault of the German people . . . but that of the leaders of the German military party, which had attained such enormous power in the country."

Greece in the War.—The only set-back had been the constrained entry of Greece into the Entente fold. Since the dismissal of Venizelos in Oct. 1915, Constantine had governed by means of phantom ministers; and in May 1916, acting under his orders, the Greek commanders admitted Bulgarian forces into Forts Rupel and Dragotin, the keys of the Struma valley, while in Aug. Greek garrisons surrendered Seres, Kavalla, and Demirhisar to the same racial enemies. This was too much for the better part of Greece. A revolution broke out at Salonika, which swept over Crete, Mytilene, Samos, Chios, and the other Greek islands in Sept.; and a provisional government of insurgent Greece was formed under Venizelos, Condouriotes, and Danglis, which was tardily—owing to Russian and Italian influence—recognized by the Entente and declared war on Bulgaria. But Constantine controlled the mainland of Old Greece, and constantly intrigued against the Entente. At length, in June 1917, Tsarist protection having been removed by the Russian revolution, the Entente intervened by force of arms, and Constantine was deposed on the 11th and removed to Switzerland. Venizelos returned to Athens on the 21st, and on the 30th diplomatic relations were severed with Germany and Austria. The high-handed proceedings of the Entente were, no doubt, necessary measures of war; but Venizelos had to pay the penalty later for the violent patronage he had enjoyed, and the Entente needed the moral support which President Wilson gave it in the drastic reply he returned to the Pope's peace note on Aug. 27. To deal with Germany by way of peace upon the plans proposed by His Holiness would, the President declared, "involve a recuperation of its strength and a renewal of its policy."

Brest Litovsk.—The recuperation of its strength was exemplified in Oct. by the further advance into Russia and the Italian disaster at Caporetto: and the renewal of its policy was seen at Brest Litovsk. On Nov. 20, a fortnight after the successful Bolshevik revolution, Lenin proposed to all the belligerents a general armistice and discussion of peace, and on the 29th Germany accepted the invitation. The armistice was concluded at Brest Litovsk on Dec. 15. The Bolsheviks inserted a clause to the effect that German troops were not to be transferred from the eastern to the western front; but the Germans simply ignored it. It was mainly for that purpose that they signed the armistice; the idea of a great offensive on the W. had already occurred to them, and in Nov. and Dec. 24 divisions were transferred. Austria's main idea was much the same: "peace at the earliest moment," said Czernin, "is necessary for our own salvation, and we cannot obtain peace unless the Germans get to Paris, and they cannot get to Paris unless the eastern front is free." Czernin, and possibly even Kühlmann, the German Foreign Secretary, were prepared for such terms as might have secured this freedom and given Ludendorff a reasonable prospect of getting to Paris; but the grasping nature of the militarists stood in their own way. A preliminary conference at German Headquarters on Dec. 18 agreed to demand the acquisition of a protective belt of territory along the Russian-Polish frontier, and a personal union of Courland and Lithuania with Germany or Prussia, and to suggest the evacuation of Esthonia and Livonia by the Russians in the interests of self-determination.

At the Conference of Brest Litovsk, which opened on the 22nd, Kühlmann and Gen. Hoffmann represented Germany, Trotsky and Joffe the Bolsheviks, and Czernin Austria-Hungary. The Bolsheviks insisted on open diplomacy, and the arguments of the diplomatists were published throughout Europe from day to day by wireless telegraphy. This was essential for their schemes, for they relied upon propaganda to rouse the proletariats in all the belligerent countries to demand a cessation of the national wars which divided their forces, in order to combine them in a universal revolutionary movement. Their proposals were the evacuation of all conquests, restoration of independence to all nations subjected during the war, self-determination for those which had not previously secured independence, and no indemnities. Czernin replied for the Central Powers on the 25th, accepting the principles of no forcible annexations and no indemnities, but making the whole bargain conditional upon the acceptance of a general peace by the Allied and Associated Powers, who were given until Jan. 4 to signify their assent. No formal reply was made by them to the invitation; but one of the most important results of the Brest Litovsk negotiations was to clinch the case for a restatement of the Entente aims in the war.

Peace Moves, 1917–8.—Russia had asked for that restatement as far back as May 30, and in a communication addressed to the Provisional Government on June 9 President Wilson had replied that "no people must be forced under sovereignty under which it does not wish to live. No territory must change hands except for the purpose of securing those who inhabit it a fair chance of life and liberty. No indemnities must be insisted on except those that constitute payment for manifest wrongs done. No readjustments of power must be made except such as will tend to secure the future peace of the world and the future happiness of its peoples. And then the free peoples of the world must draw together in some common covenant . . . that will in effect combine their force to secure peace and justice in the dealings of nations with one another." On Nov. 18 M. Clemenceau, the new French premier, spoke slightingly of a League of Nations, remarking that he was only out to win the war; and the Bolshevik publication of the Secret Agreements which began on the 22nd revealed the gulf which separated the Old World ambitions of the Entente Powers from the objects for which Mr. Wilson had told revolutionary Russia "we can afford to pour out blood and treasure." On the 29th Lord Lansdowne published a letter in the *Daily Telegraph* (*The Times* having declined to give it publicity) coupling a demand for a restatement of war aims with a more dubious proposal for peace negotiations. To the latter suggestion Wilson made an effective reply by declaring war on Austria on Dec. 4, and fulminating against German power as "a thing without conscience or honour or capacity for covenanted peace" and refusing to negotiate until the "German people have spokesmen whose word we can believe" and "those spokesmen are ready in the name of their people to accept the common judgment of the nations as to what shall henceforth be the bases of law and of covenant for the life of the world. . . . Our immediate task is to win the war." But even he had not grasped all the implications: "We do not wish in any way to impair or to rearrange the Austro-Hungarian Empire," and it was left to France to recognize on Dec. 19 the Czechoslovak forces as "an autonomous army."

The Fourteen Points.—The initiative in a comprehensive and radical restatement of war aims was taken in a British Labour Memorandum, which was adopted without amendment by a special Labour conference on Dec. 28 and was then, with changes due to President Wilson's address of Jan. 8 1918, accepted by the Inter-Allied Labour and Socialist Conference in London on Feb. 22. Basing itself on Wilson's principle that "the world must be made safe for democracy," it emphasized the necessity, and sketched a plan, for a League of Nations, declared that the problem of Alsace-Lorraine was one of right and not of territorial readjustment, demanded restoration and reparation for Belgium and the Balkan States (with a Customs and Postal Union for the latter), the independence of Poland with access to the sea, the liberation of subject peoples from Turkish rule with the neutralization of the Dardanelles, condemned German annexation in Livonia, Courland, or Lithuania, and "the aims of conquest of Italian imperialism," and while "not proposing as a war aim the dismemberment of Austria-Hungary" protested against regarding "the claims to independence made by the Czechoslovaks and the Yugoslavs merely as questions for internal decision." Most of these aims were accepted in principle by Mr. Lloyd George on Jan. 5 after consultation with Dominion statesmen, Labour leaders, and Lord Grey and Mr. Asquith; but he made some notable concessions to what seemed to be the realities of the situation, and disclaimed any idea of fighting to "alter or destroy the imperial constitution of Germany," "to destroy Austria-Hungary," or even "to deprive Turkey of its capital or of the rich and renowned lands of Thrace, which are predominantly Turkish in race"; and he seemed lukewarm about the League of Nations. Then on Jan. 8, in an address to Congress, President Wilson laid down his famous "Fourteen Points," demanding:—

I. Open covenants of peace, openly arrived at, after which there shall be no private international understanding of any kind, but diplomacy shall proceed always frankly and in the public view.

II. Absolute freedom of navigation upon the seas, outside territorial waters, alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants.

III. The removal, as far as possible, of all economic barriers and the establishment of an equality of trade conditions among all the nations consenting to the peace and associating themselves for its maintenance.

IV. Adequate guarantees given and taken that national armaments will be reduced to the lowest point consistent with domestic safety.

V. A free, open-minded, and absolutely impartial adjustment of all colonial claims, based upon a strict observance of the principle that in determining all such questions of sovereignty the interests of the populations concerned must have equal weight with the equitable claims of the Governments whose title is determined.

VI. The evacuation of all Russian territory and such a settlement of all questions affecting Russia as will secure the best and freest coöperation of the other nations of the world in obtaining for her an unhampered and unembarrassed opportunity for the independent determination of her own political development and national policy and assure her of a sincere welcome into the society of free nations under institutions of her own choosing; and, more than a welcome assistance also of every kind that she may need and may herself desire. The treatment accorded to Russia by her sister nations in the months to come will be the acid test of their goodwill, of their comprehension of her needs as distinguished from their own interests and of their intelligent and unselfish sympathy.

VII. Belgium, the whole world will agree, must be evacuated and restored, without any attempt to limit the sovereignty which she enjoys in common with all other free nations. No other single act will serve as this will serve to restore confidence among the nations in the laws which they have themselves set and determined for the government of their relations with one another. Without this healing act the whole structure and validity of international law is forever impaired.

VIII. All French territory should be freed and the invaded portions restored, and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine, which had unsettled the peace of the world for nearly fifty years, should be righted, in order that peace may once more be made secure in the interest of all.

IX. A readjustment of the frontiers of Italy should be effected along clearly recognized lines of nationality.

X. The peoples of Austria-Hungary, whose place among the nations we wish to see safeguarded and assured, should be accorded the freest opportunity of autonomous development.

XI. Rumania, Serbia, and Montenegro should be evacuated; occupied territories restored; Serbia accorded free and secure access to the sea; and the relations of the several Balkan States to one another determined by friendly counsel along historically established lines of allegiance and nationality; and international guarantees of the political and economic independence and territorial integrity of the several Balkan States should be entered into.

XII. The Turkish portions of the present Ottoman Empire should be assured a secure sovereignty, but the other nationalities which are now under Turkish rule should be assured an undoubted security of life and an absolutely unmolested opportunity of autonomous development, and the Dardanelles should be permanently opened as a free passage to the ships and commerce of all nations under international guarantees.

XIII. An independent Polish state should be erected which should include the territories inhabited by indisputably Polish populations, which should be assured a free and secure access to the sea, and whose political and economic independence and territorial integrity should be guaranteed by international covenant.

XIV. A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike.

The Humiliation of Russia.—In introducing these points President Wilson referred to the Brest Litovsk negotiations as having been broken off, and described "the whole incident" as "full of significance." There had, indeed, during the interval allowed for the Entente to reply, been a violent disagreement between Ludendorff and Kühlmann, who was supported by Czernin and Hertling. On Dec. 28 the militarists secured a German declaration to the effect that the representative bodies existing in the occupied territories under German protection expressed their "self-determination" and that plebiscites were superfluous. On Jan. 2 Trotsky denounced these claims as hypocritical, and proposed to change the seat of the conference from Brest to Stockholm. He reappeared at Brest, however, on Jan. 7, asseverating that the Bolsheviks would make no peace that was not "just and democratic": and there followed weeks of discussion on the meaning of "self-determination" and its methods of expression. Trotsky's flank was turned by the appearance of delegates from the Ukraine asserting their independence of Russia. They represented only the middle-class Rada, while Ukraine revolutionaries sided with the Bolsheviks, seized Kiev, and overran most of the Ukraine. The Rada thereupon signed a peace with the Central Powers on Feb. 9, which gave Polish Kholm to the Ukraine and sowed the seeds of discord between the two nationalities, and invited the Germans and Austrians to drive the Bolsheviks out of the Ukraine. They were willing enough; food was their real quest, and alarming strikes had already broken out in Vienna, Berlin, and elsewhere.

These seemed to give Trotsky the leverage he had been seeking, and on the day the Ukraine treaty was signed he issued a wireless call to the German army to refuse obedience to the Kaiser. Next day he declared war to be at an end, but refused to sign a German peace. On Feb. 13 Germany denounced the armistice, and on the 18th recommenced the march toward Petrograd and the occupation of the Ukraine. There was no organized resistance; the peace of Brest Litovsk was signed on March 3 and ratified by a congress of Soviets at Moscow, after a three days' debate, on the 16th. The Baltic nationalities were surrendered by Russia for their fate to be determined between themselves and Germany; the Ukraine treaty of Feb. 9 was accepted by the Bolsheviks; Russia was also required to cede the districts of Kars, Ardahan, and Batum to Turkey; commercially she was made a preserve for the Central Powers; and the two million German colonists in Russia were exempted from the legislation of, and allegiance to, the Bolshevik Government. Trotsky had given up foreign affairs on March 8 and devoted himself to the more promising task of organizing a Red army; it was left for Lenin to persuade the Soviets of the necessity of temporarily bowing to the inevitable. Consequential and similar treaties were signed between the Central Powers and Finland on March 7 and with Rumania, provisionally, on March 5 and finally on May 7. German control over their commerce, industry, and finance was established in both, and Rumania further ceded the Carpathian crests and the Dobruja.

Germany and the Fourteen Points.—These deeds were a more convincing reply to President Wilson's "Fourteen Points" than the disingenuous speeches made in concert by Kühlmann and Czernin at Berlin and Vienna on Jan. 24. The Central Powers had been given the opportunity of demonstrating the interpretation which they put on victory; and there could not remain the slightest doubt that they would impose similar, if not severer, conditions upon the rest of the world if they got the chance. Nothing could have been more sinister or more impressive than the complete contradiction between their words to Powers which they did not yet control and their deeds to those which they did; and whatever criticisms might be made of the ultimate settlement, they would have to be based not on the ground that the Central Powers suffered more than they deserved, but that the penalties were impolitic and fell on the wrong shoulders. The treaties were approved of by all parties in the Reichstag except the Minority Socialists and the Poles; and early in March the Minority Socialists lost a seat at Nieder Barnim.

There was little more for diplomacy to say. It was obvious, although the fact was not universally recognized, that the speeches of Teutonic ministers afforded no basis for negotiation, since from Brest Litovsk onward the German G.H.Q. superseded the Government; but it was a blunder on the part of the supreme war council at Versailles to issue on Feb. 4 a statement that it would not accept Hertling's and Czernin's professions and had decided on a vigorous prosecution of the war, thereby creating the impression that the same supersession of the civil by military power was also taking place in the Entente. Nevertheless, President Wilson did, indeed, on Feb. 11 give a useful definition of Four Principles on which the settlement must be based; and he used what his Secretary of State, Lansing, subsequently denounced as an explosive expression when he declared that "'Self-determination' is not a mere phrase. It is an imperative principle of action which statesmen will henceforth ignore at their peril." But he was in closer touch with the realities of the situation when on April 6, commenting on the contrast between Hertling's professed acceptance of those four principles and the militarist terms dictated at Brest Litovsk, he declared: "Germany has once more said that force, and force alone, shall decide whether justice and peace shall reign in the affairs of men, whether Right as America conceives it or Dominion as she conceives it shall determine the destinies of mankind. There is, therefore, but one response possible from us: force, force to the utmost, force without stint or limit, the righteous and triumphant force which shall make Right the law of the world, and cast every selfish Dominion down in the dust."

It needed, however, a crisis to elicit an adequate display of American force on fields where the issue would be decided. In the previous Nov. the Kaiser had declared that the only means to secure peace was for Germans to hew their way through those who would not make it; and the terms of the Treaty of Brest Litovsk are intelligible only on the assumption that he relied upon a German offensive on the western front to constrain the Entente to recognize those terms if not to accept similar ones for themselves. From the beginning of the German offensive on March 21 until the first Austrian peace-note on Sept. 15 the pen gave way to the sword. Czernin resigned on April 15 after his controversy with Clemenceau over the Sixte of Parma *pourparlers* in the summer of 1917, but the fact that he was succeeded by Burian indicated a stiffening rather than a relaxation of the Austrian attitude. Nor had the growing discontent and the declining *moral* of the German people any effect upon the diplomatic situation, although in Jan. strikers had demanded peace on the basis of self-determination without annexations or indemnities, and crowds in Berlin had vociferated against a fresh offensive on the western front.

War Weariness.—More potent than social ferment in Germany was imperial disintegration in Austria. The disaster at Caporetto had a wholesome effect upon the Italian attitude toward the Yugoslavs, and the revelation of the secret Treaty of London by the Bolsheviks gave more progressive opinion in Italy an opportunity of expressing itself. In Feb. 1918 a committee was formed to promote an understanding with the Yugoslavs, and on March 7 Signor Torre on a visit to London arranged with Dr. Trumbitch the holding of a congress of oppressed nationalities at Rome. It met early in April, and on the 10th produced the "Pact of Rome," by which the "unity and independence" of the Yugoslav nation, "known also as the nation of Serbs, Croats, and Slovenes," were recognized as a vital interest for Italy, and the completion of Italian unity as a vital interest for the Yugoslavs. It was also mutually agreed to defend the freedom of the Adriatic against every enemy present or future, and to decide amicably the territorial questions between them on the basis of nationality and self-determination. This entente was of the utmost value in promoting the successful Italian resistance on the Piave in June and victory in Oct. President Wilson hastened to bless the practical application of his own principles; on June 28 he asserted that all branches of the Slav race must be completely freed from German and Austrian rule; on Sept. 3 he formally recognized the Czechoslovak National Council as a belligerent Government; and on Oct. 18 in reply to the Austrian peace-note declared that he was no longer at liberty to accept the "autonomy" of these peoples—as indicated in the tenth of his Fourteen Points—as a basis of peace, but "is obliged to insist that they, and not he, shall be the judges of what action on the part of the Austro-Hungarian Government will satisfy their aspirations and their conceptions of their rights and destiny as members of the family of nations."

For the time, the success of the German offensive made all talk about terms of peace irrelevant except on the German side, where it generally took the form of repudiating the peace resolution of July 1917. But before the end of April confidence began to wane, first at G.H.Q. and then in the public mind in Germany itself. The difference was that the worse the situation became, the more determined Ludendorff grew in his persistence, and the more sceptical the public showed itself of his success; the reason was that the militarism of the German Government became more and more involved in the fortunes of the war. On June 24 Kühlmann in a long speech let fall the phrase, "an absolute end can hardly be expected through purely military decisions alone"; and a fortnight's disputation over his meaning ended in his resignation at Ludendorff's behest on July 9. It had become heresy, in the waning prestige of militarist orthodoxy, to dispute what the German G.H.Q. could do; and Kühlmann's successor was von Hintze, its nominee without any pretence of that "parliamentarization" which both the Reichstag and President Wilson had demanded as a preliminary to peace. On July 4 President Wilson laid down four great ends of the war, which he said "can be put into a single sentence. What we seek is the reign of law, based upon the consent of the governed and sustained by the organized opinion of mankind." Next day Mr. Lloyd George said the Kaiser could have peace to-morrow if he would accept the President's terms. But Ludendorff's conception of the reign of law was the will of G.H.Q. sustained by German arms, and he was desperately bent on giving it effect.

He refused to admit in words that his increasing lack of success and resources, or even Foch's counter-offensive on July 18, had made his position hopeless. But he confessed that Aug. 8 was Germany's "black day," and on the 14th at a crown council at Spa the Kaiser decided that negotiations must begin on the first suitable occasion. The Austrian Emperor and Burian emphasized the need on the 15th, and wanted to begin at once. A fortnight was spent in arguing, and on the 30th Austria threatened an independent overture. But both parties assumed that defensive war could still be successfully carried on in France, while the offensive submarine inclined the enemy to a peace which would leave the Central Empires their ill-gotten gains in the east; and they were at the moment engaged on the supplementary treaties of Brest Litovsk, which, as signed on the 27th, compelled the Bolsheviks to oppose the Entente forces in N. Russia, to renounce sovereignty over Esthonia, Livonia, and Georgia and to pay heavy gold indemnities, and riveted the German economic yoke more firmly than ever. The German public and even the civil government looked helplessly on while G.H.Q. wasted their opportunities for peace. There was no foresight, and no discussion of any terms that might have satisfied enemies whom Germany found it increasingly difficult to resist. Civil intelligence had abandoned its functions for so long to the soldier that it was simply atrophied for lack of use; and it was not until late in Oct. that ministers screwed up their courage to action independent of General Headquarters.

Concluding Stages.—By that time the Hindenburg defences on which the army and public relied had broken down. On Sept. 2 the Wotan line was pierced, on the 12th the Americans wiped out the St. Mihiel salient, and on the 15th, the day on which the Bulgarian line in the Balkans was broken, Austria addressed a peace-note to belligerents, neutrals, and the Pope proposing a confidential and non-committal discussion in some neutral country. President Wilson replied on the following day that the United States " can and will entertain no proposal for conference upon a matter concerning which it has made its position and purpose so plain "; and Austria retired from the diplomatic struggle. German G.H.Q. were not reduced to a suppliant attitude until the 29th, the day on which Bulgaria signed her armistice and went out of the war, abandoning the whole of the Balkans to the Entente. Meanwhile Allenby had destroyed the Turkish armies in Palestine, the Hindenburg lines in front of Cambrai had been broken, and a combined offensive in Belgium had undermined Germany's hold on the coast. On the 27th President Wilson added " Five Particulars " to his " Fourteen Points," " Four Principles," and " Four Ends." Some details, he said, were needed to make his general terms " sound less like a thesis and more like a practical programme." But even these particulars were less terms of peace than principles which must govern those terms, and they were as follows:—

> *First*, The impartial justice meted out must involve no discrimination between those to whom we wished to be just and those to whom we did not wish to be just.
>
> *Second*, No special or separate interest of any single nation or any group of nations can be made the basis of any part of the settlement which is not consistent with the common interest of all.
>
> *Third*, There can be no leagues or alliances or special covenants and understandings within the general and common family of the League of Nations.
>
> *Fourth*, And, more specifically, there can be no special selfish economic combinations within the League, and no employment of any form of economic boycott or exclusion, except as the power of economic penalty, by exclusion from the markets of the world, may be vested in the League of Nations itself as a means of discipline and control.
>
> *Fifth*, All international agreements and treaties of every kind must be made known in their entirety to the rest of the world.

Two days later Hertling and all his ministers resigned in order that the Kaiser might be provided with an administration supported by the Reichstag to meet the President's objection to negotiating with an autocratic government; but the Kaiser in accepting this principle would only say that it was his " will that men who are supported by the confidence of the people should, to a large extent, participate in the rights and duties of the Government." Prince Maximilian of Baden was appointed German Chancellor, and he had to deal with a veritable panic at G.H.Q. Ludendorff was in despair. " To-day, " he declared, " the soldiers hold their ground; it is impossible to foresee what may happen tomorrow . . . the peace offer must be made to-day." Hindenburg was hardly less emphatic: " Every day of delay will cost thousands of brave soldiers their lives." So on Oct. 4 a first peace-note was despatched by Germany. The appeal was to President Wilson alone, asking him to take steps for the restoration of peace. The German note accepted the Fourteen Points as a programme; the Austro-Hungarian note, which followed on Oct. 7, accepted also the Four Principles of Feb. 11 and agreed that the Five Particulars should " also be taken into account."

The President's replies to these and to the succeeding notes constituted a process of depriving the German Government one by one of possible loopholes of escape, and of the means, such as defensive warfare on French soil, delay for recuperation, and the submarine campaign, by which Ludendorff still hoped that the situation might be improved. On Oct. 8 he pressed for more specific acceptance of his principles, declined to propose an armistice unless the Central Powers consented " immediately to withdraw their forces everywhere from invaded territory," and pointedly asked whether the German Chancellor was merely speaking for the imperial authorities who had so far conducted the war. Satisfactory assurances were given by Germany on the 12th with regard to the first; but as to the second she proposed a mixed commission, and as to the third was not conclusive. Her acceptance of the first justified the President, as he said on the 14th, in being frank with regard to the other two points; the process of evacuation and terms of the armistice must be left to the advice of the military authorities, but no arrangement could be accepted which did not guarantee the present military supremacy of his Government and its Allies. Nor would he or they consent to consider an armistice so long as German submarines continued their sinking of passenger ships, and German troops the pillage and destruction which marked their withdrawal. With regard to the democratic character of the German Government, he referred to his " Four Ends " speech of July 4, in which he had plainly intimated that if the Germans wanted peace they must change their constitution. To the Austro-Hungarian note he returned a separate reply on the 18th, explaining his change of attitude toward Czechoslovak and Yugoslav " autonomy."

Both Governments made in reply concessions, in view of which the President said on the 23rd he could not decline to take up the question of an armistice with his Allies. He had therefore transmitted the correspondence to them; but he pointed out that extraordinary safeguards would have to be demanded in view of the fact that " the power of the King of Prussia to control the policy of the Empire is unimpaired . . . that the nations of the world do not and cannot trust the word of those who have hitherto been the masters of German policy." If the Government of the United States " must deal with the military masters and the monarchical autocrats of Germany . . . it must demand not peace negotiations but surrender. Nothing can be gained by leaving this essential thing unsaid."

The German reply was dated the 27th. Incidentally that was the date of the Austrian *débâcle* on the Piave; but Germany's action was dictated by events nearer home. Almost the last vestige of the Hindenburg defences had disappeared. But Ludendorff had recovered his obstinacy, if not his nerves, and urged the rejection of Wilson's terms. At last the civilian ministers acted on their own responsibility, and Ludendorff had to resign on the 27th. Next day, when the High Seas Fleet, the submarine having been barred, was ordered out, it mutinied; and the German note merely intimated that the German Government awaited the proposals for an armistice. But the President's Allies had still to be heard; and on Nov. 5 he informed Germany that they reserved complete freedom of action at the Peace Conference with regard to the freedom of the seas, and understood by " restoration " " compensation for all damage done to the civilian population of the Allies and their property by the aggression of Germany by land, by sea, and from the air." No reference was apparently made to the Secret Agreements, which therefore would not be binding on the Conference.[1]

---

[1] *See* PEACE CONFERENCE for the actual proceedings.

Germany raised no further objections, and on Nov. 7 the Armistice Commission met. It continued its deliberations, to the accompaniment of popular insurrections and monarchical abdications, until on the 11th an Armistice was signed on the day that Americans fought their way into Sedan and Canadians into Mons. Verily a New World had been called in to redress the balance of the Old. For subsequent events see especially articles on GREECE, RUSSIA, OTTOMAN EMPIRE, and other countries of Eastern Europe. (A. F. P.)

WRANGEL, PETER NICHOLAIEVICH, BARON (1879–), Russian general, was born in Petrograd in 1879, the eldest son of an impoverished Baltic nobleman of Swedish descent. His father, Baron Nicholas Igorevich, held an important post in the International Bank, at Petrograd. At the age of 20 Wrangel entered the Mining Institute at Petrograd and finished its course brilliantly. He served as private in the Horse Guards for one year. Leaving the regiment with the rank of N.C.O. he went to Siberia and worked there as a mining engineer until the Russo-Japanese War. At the beginning of that war he joined the Trans-Baikal Cossack Regt., which he left at the end of hostilities with the rank of captain. He retained his rank in the Horse Guards, which he rejoined after the war, thus devoting his life to the military profession. At the beginning of the World War he was in command of a squadron, but was soon promoted colonel, received the St. George Cross and was made A.D.C. to the Tsar. In 1915 he was appointed commander of a Cossack regiment at the Galician front. Later he rose to the command of a Cossack division. Wrangel was among the first officers who joined Gen. Kaledin in his fight against the Bolsheviks, and after Kaledin's suicide he took part in the organization and struggle of the volunteer army under Alexeyev and Denikin, and distinguished himself especially by the defence of Tsaritsyn. After the disastrous retreat of Gen. Denikin, from Orel to the Black Sea, Wrangel was appointed on April 4 1920 commander of the volunteer army. Men and officers of the army were demoralized, and the lack of munitions and food supplies made the situation almost desperate. Fortunately for Wrangel, the Bolsheviks considered the volunteer army to be out of action, and they had to send a large part of their forces against the Poles who were approaching Kiev. This made it possible for Wrangel to attempt the reconstruction of the southern army; and for some time his attempt was successful. His nomination to the post of commander-in-chief corresponded with the attempt of Mr. Lloyd George to induce the volunteer army to begin peace negotiations with Soviet Russia. In a note to this effect the volunteers were warned that, in case of refusal, they would be deprived of all British support; this note was handed to Gen. Denikin on April 4, and seems to have been one of the chief causes of his resignation. Replying to this proposition Wrangel refused to enter into direct negotiations with the Bolsheviks, and asked the Allies to guarantee the life and safety of his troops and of the refugees under his protection. These negotiations proved eventually a failure. In the meantime Wrangel did his best for the reorganization of the army and the administration. A Council was formed which continued the work of Denikin's Government. Krivochin was nominated president of the council; Peter Struve received the portfolio of Foreign Affairs, Bernadsky that of Finance. The Government was modelled on the basis of personal dictatorship. In the " Statute " published on April 14 it was proclaimed that the " Ruler and Commander-in-Chief of the armed forces of South Russia holds full military and civil power without any limitation whatever." It was intended that this temporary dictatorship should lead in the future to the reconstruction of Russia. The main points of Wrangel's programme were outlined by Struve in an interview to the representative of an English paper in the following way:—

> " The seizure by the peasants of large properties should be recognized wherever it has actually taken place. It constitutes the starting point for wide agricultural reform destined to assure the peasants the full ownership of the land which they cultivate. The agrarian revolution which has taken place in favour of peasants would thus be legalized, and, to the profit of the new owners of the soil, would result in an agrarian organization based on the principle of private property, which corresponds beyond doubt to the aspirations of the peasants." (These principles served as a foundation to the " Rules for the transfer of agricultural land to the tillers of the soil " of March 25 1920.) " The future organization of Russia should be based on an agreement between the existing political formations. The union of the different parts of Russia, at present divided, in a large federation would be founded on voluntary agreement between them, resulting from the community of interests, and, above all, from economic needs. This policy in no way seeks to enforce union by violence. Whatever may be the future relations of the different parts of Russia now separated from one another, the political organization of these territories and the constitution of their federal union should be founded on the free expression of popular will by means of representative assemblies elected on democratic basis. The underlying motive of Wrangel and those who supported him in attempting to establish themselves in Southern Russia was the conviction that while, sooner or later, the Bolshevist system must come to an end, it is nevertheless essential that its disintegration should be assisted by outside action."

The reorganization of the army by conscription proceeded successfully, and the events of the Polish front as well as the shortage of food in Crimea obliged Wrangel to try a new offensive. On May 25 he began an advance on the whole front, combined with landings on the coast to the east and west, which resulted in a series of defeats for the Bolsheviks. The whole of the fertile corn lands of the Taurida Province were occupied, and the position of the army was greatly strengthened. At the end of June the new line of the front passed approximately through Berdyansk (Sea of Azov), Tokmak (Sevastopol-Kharkov railway), Alioshki (on the Dnieper, near Kherson). The front of 30 km. had been extended to one of 250 kilometres.

With the defeat of Poland Mr. Lloyd George renewed his proposals as to settlement with the Bolsheviks at the conference of Spa. On the contrary, on Aug. 11 the French Government issued a statement which declared, " that taking into consideration the military successes and the growing strength of the Soviet Republican Government " it was recognized by France as the *de facto* Government of Russia under the obligation of recognition of Russian debts, and the promise to follow a democratic policy with regard to domestic affairs.

Wrangel and his Government tried to follow these advices in spite of the opposition of a section of the Russian society. But the heavy hand of the military dictatorship made itself often felt in spite of the democratic programme. For example, in his order of Oct. 3 Wrangel prohibited all " public speeches, sermons, lectures and conferences tending to arouse political or national disorder." His relations with the Caucasus, Ukraine, Poland and other territories, which had been parts of the Russian Empire before the revolution, were of vital importance for the success of the undertaking. The principle of federation was proclaimed and resulted in the agreement of July 22 (Aug. 4) between Wrangel on the one side and the Atamans of Don, Kuban, Terek and Astrakhan on the other. Complete self-government was granted to the Cossacks in their internal organization and administration, but the direction of foreign relations and of military affairs was reserved for the Commander-in-Chief. A delegation of the Paris Ukrainian National Committee was received by Wrangel at Sevastopol on Sept. 23, and established coöperation of the non-separatist Ukrainians with Wrangel. In order to facilitate the organization of a special Ukrainian administration and the formation of Ukrainian military units, a Commissioner for Ukrainian affairs was appointed in Wrangel's Government with the rank of Minister. Wrangel was also recognized as the supreme chief of the anti-Bolshevik movement by the leader of the Siberian Cossacks, Ataman Semenoff, and the chiefs of different independent guerilla units acting in the south of Russia, the best known of whom is Makhno. Wrangel successfully repulsed all Bolshevik attacks until the end of Oct., and even found it possible to extend the area of his occupation. An official *communiqué* at the end of Oct. reports " that between May 25th and October 25th the Russian army had captured 70,500 prisoners, 250 guns, 17 armoured trains, 21 armoured cars, hundreds of horses, and considerable amount of other booty." But these successes were only of a short duration. Peace with Poland had freed considerable Bolshevik forces, which were transferred to the southern front against Wrangel. The small army numbering 45,000 trained soldiers was unable to defend a front of 400 km. against the overwhelming number of Bolsheviks, well provided with heavy artillery and unlimited munitions. The isthmus of Perikop had to be abandoned in consequence of a turning movement by the Reds across the "Putrid Sea." On Nov. 15 Sevastopol was occupied by the Bolsheviks.

The evacuation of the army and of thousands of refugees was carried out in good order under the personal supervision of Wrangel, who was the last to leave on board the "Korniloff." A total of 130,000 people were evacuated, of whom 70,000 were soldiers (30,000 fighting men, and 40,000 from the rear), about 7,600 wounded, the rest being civilians. One hundred and fifty million fr. were advanced by the French Government for the relief of the army and refugees, who were in the most awful condition. The refugees were sent to Lemnos, to Egypt and to Yugoslavia.

Wrangel hoped that the evacuation would enable him to keep his army together as a fighting unit to be used at the first opportunity against the Bolsheviks. The excellent discipline and gallantry of the troops and their devotion to their chief favoured such a plan; but it could not be effected without the support of the Allies, and this resource proved to be exhausted.

The French Government, which had done most for the forces in the Crimea, was unwilling to continue a policy which it considered hopeless. M. Leygues, the successor of M. Millerand as prime minister, demanded categorically the disbandment of Wrangel's army, and the General was directed to announce to the troops that he was not their chief any more and that they were free to disband. About 10,000 were "repatriated" to Soviet Russia, about 12,000 accommodated in Serbia and Brazil. The best part of the army kept together in the camp of Gallipoli in their regimental formations, maintaining—according to the testimony of foreign officers—excellent discipline and sturdy spirit. The problem as to what was to be done with these picked troops was still unsolved in the winter of 1921. France had withdrawn her support; Serbia had taken over 5,000 cavalry to serve as frontier guards; the rest were expecting assistance from Russian institutions abroad, such as the Russian embassies in Washington and Tokio, and from the intervention of the League of Nations. (P. Vi.)

WRENBURY, HENRY BURTON BUCKLEY, 1st Baron (1845–), English judge, was born in London Sept. 15 1845. His father was for many years vicar of St. Mary's, Paddington, and Arabella Buckley, the author of *The Fairy Land of Science* (1878), was his sister. He was educated at Merchant Taylors' school and Christ's College, Cambridge, being ninth wrangler in 1868. In 1869 he was called to the bar, and rose to a position of eminence as an authority on company law. He became a Q.C. in 1886 and a bencher of Lincoln's Inn in 1891, while from 1883 to 1898 he was a member of the Bar Committee and the Bar Council. In 1900 he was made a judge of the Chancery division, and in 1906 became a lord justice of appeal and a privy councillor. He retired in 1915, and was raised to the peerage, his high legal authority adding strength to the House of Lords. Lord Wrenbury founded in 1904 the Buckley scholarship in political economy at Cambridge, later styled the Wrenbury scholarship, to be held by scholars from Merchant Taylors' school. His *Law under the Companies Acts* (1873; 9th ed. 1909) is a standard work.

WRIGHT, SIR ALMROTH EDWARD (1861–), British bacteriologist, was born at Middleton Tyas, Yorks, Aug. 10 1861. He was educated at Dublin University, and afterwards studied law, subsequently obtaining his medical and scientific education at the universities of Leipzig, Strassburg and Marburg. In 1887 he became a demonstrator of pathology at Cambridge; in 1889 went to Sydney as lecturer in physiology, and from 1892 to 1902 was professor at the army medical school at Netley, being then appointed professor of experimental pathology in the university of London. He was knighted in 1906. Sir Almroth Wright came into prominence primarily by his remarkable researches into the problems of parasitic diseases. He introduced the system of anti-typhoid inoculation (*see* 20.775, 783), and also did much valuable work on the preparation of other vaccines and toxins, while he carried out many important experiments in bacterial infection and in measuring the protective matter of human blood. He acted as a consulting physician to the army in France from 1914–9, and was in 1918 created K.B.E. He has published *System of Anti-Typhoid Inoculation* (1904); *Principles of Microscopy* (1906) and *Studies in Immunisation* (1909), besides many papers in medical and scientific periodicals. In 1913 appeared *The Unexpurgated Case against Woman Suffrage,* which provoked much discussion.

WRIGHT, WILBUR (1867–1912), American inventor, was born near Millville, Ind., April 16 1867. He was the son of Milton Wright, a bishop of the United Brethren in Christ. He secured a high-school education in Richmond, Ind., and Dayton, O. Together with his brother Orville he opened a shop for repairing bicycles at Dayton in the early 'nineties. The Wright brothers early became interested in the problem of flying, and from about 1900 made many experiments with gliding machines at Kittyhawk, N.C. On Dec. 17 1903 such a machine with a petrol motor attached flew 260 yd., the first successful flight of an aeroplane; and on Oct. 5 1905, near Dayton, they accomplished their first successful long flight, more than 24 m., at the speed of 38 m. an hour. In spite of this proof of the practicability of flight in heavier-than-air machines, they were unsuccessful in enlisting financial support in America. In 1908 Wilbur Wright went to France, and on Sept. 21 won the Michelin prize by a flight of 56 miles. This brought him international fame. In Dec. of the same year he made from Le Mans, France, a flight of 77 m. in 2 hours and 20 minutes. In 1909, during the Hudson-Fulton Exposition in New York City, he flew from Governor's I. up the Hudson river to Grant's tomb and back, travelling 21 m. in 33 minutes and 33 seconds. On March 3 1909 Congress awarded the Wright brothers a special medal. Later the U.S. Government purchased a machine for $30,000, and afterwards the invention was officially adopted by the U.S. army. The French patents were sold for $100,000. After 1910 Wilbur Wright gave up public flying and devoted his time to mechanical improvement of the Wright machine. He received many medals and honours from European countries. He died at Dayton, May 30 1912.

His brother, Orville Wright (1871–), was born at Dayton, O., Aug. 18 1871. He was educated in the Dayton schools, worked with his brother Wilbur in the bicycle repairing business, and was closely associated with him in all his experiments in developing a practicable aeroplane. He shared in the many honours awarded by foreign countries, and after the death of his brother became director of the Wright Aeronautical Laboratory at Dayton. In 1913 he received the Collier trophy for developing the automatic stabilizer. In 1915 he was appointed a member of the U.S. Naval Consulting Board. The same year the Wright Aeroplane Co. sold its patents to a New York syndicate, Orville Wright remaining chief engineer.

WRIGHT, WILLIAM ALDIS (1836–1914), English man of letters (*see* 28.847), died at Cambridge May 19 1914. His last publication was *The Hexaplar Psalter* (1911). In 1912 he resigned the vice-mastership of Trinity College, Cambridge, and lived in retirement till his death.

WUNDT, WILHELM MAX (1832–1920), German philosopher (*see* 28.855), died at Leipzig Sept. 1 1920. His principal work was done before 1907. At the outset of the World War he published an address justifying Germany, and his *Die Nationen und ihre Philosophen* (1915) eulogizes German thought and culture whilst belittling those of England and France.

WÜRTTEMBERG (*see* 28.856). Pop. according to 1919 census, 2,518,773. During 1910–1921 the constitutional question in Württemberg passed through decisive developments. The constitution dating from Sept. 20 1819 was one of the oldest in Germany. Created by a contract between the King and the Assembly of Estates, it was based upon the people's will and could, for that very reason, be maintained almost without alteration for close upon a century.

The first alteration of any importance was made in 1906, when Württemberg introduced, before any other German state, the proportional system of election for the Second Chamber of the Diet. The result of the elections of 1906 was such that the two Liberal parties on the one side and the Catholic Centre and the Conservatives on the other were equally strong, so that the Social Democrats held the balance. The elections of 1912 brought about a fresh grouping of parties. The Conservatives and the Catholic Centre (forming together the so-called "Black-and-Blue *bloc*") returned as many deputies as all the other parties together, with the consequence that very keen opposition developed between the Right and the Left. The composition of the Ministry, it is true, was not affected by the constellation of parties, as the government of Württemberg was not on the parliamentary system. The Weizsäcker Ministry remained in office and continued to conduct its policy on the liberal lines which had always been followed in Württemberg. The demand for the appointment of parliamentary ministers, which had been vigorously prosecuted by the Democratic (non-Socialist) party during the World War, was rejected by the Weizsäcker Ministry, notwithstanding its liberal tendencies, until the change in the constitution of the Empire under Prince Max of Baden's chancellorship in Oct. 1918 compelled the Württemberg Government to give way. The Weizsäcker Ministry resigned. A new Ministry was formed, containing a member of each of the four parties, the Catholic Centre, the National Liberal, the Democrats and the Social Democrats. The Democrat Liesching was made president of the Ministry. This new Ministry was going to meet on Nov. 8, but on Nov. 9 the revolution broke out in Stuttgart and on Nov. 10 the Liesching Cabinet resigned. A provisional Government was formed, consisting at first entirely of Social Democrats. The most extreme members of this Government, however, were ejected on Nov. 11, and a member of each of the three parties, the Centre, the Democrats and the National Liberals, entered the Cabinet. After the disturbances which broke out in Jan. 1919 the Independent Socialists left the Ministry, and its composition then remained unaltered until the general election of the year 1920.

The King, William II. (born 1848), had abdicated on Nov. 30 1918 and retained only the title of Duke of Württemberg. He subsequently lived mostly at Bebenhausen Castle in the Black Forest, where he died on Oct. 2 1921. The headship of the family passed to Duke Albrecht of Württemberg. The abolition of the monarchy in Württemberg was solely a consequence of the fall of the Hohenzollern monarchy in the empire. The King of Württemberg himself had enjoyed great popularity, which extended into the ranks of the Social Democrats. The democratic tendencies which had always prevailed in Württemberg had, after the revolution, the favourable effect of enabling the Territory (*Land*) to settle down with comparative rapidity, and the coöperation of the so-called "bourgeois" (*i.e.* non-Socialist) parties with the Social Democrats took place without any serious friction.

After Nov. 9 1918 Württemberg experienced no further political convulsion of a serious character. The disturbances of Jan. 1919 were quickly suppressed. The attempt of the extremists among the working classes to cause disturbances by a general strike was frustrated by the action of the railway officials in paralysing the communications with Stuttgart. The Bavarian Communist insurrection produced no effect in Württemberg; it was, on the contrary, suppressed with the aid of Württemberg troops before it could spread across the border. During the so-called Kapp "Putsch" (March 1920) the Government of the Reich and the National Assembly removed for a short time from Berlin to Stuttgart because they felt that they would be safest in the capital of Württemberg.

The provisional Government of Württemberg issued on Nov. 2 1918 regulations for the election of a Representative Assembly which should meet and vote the new constitution. The elections of Jan. 12 1919 resulted in the return of 52 Social Democrats, 38 Democrats, 31 members of the Catholic Centre, 25 Conservatives and 4 Independent Socialists. The Assembly first confirmed the Government in office and then proceeded to deal with the new constitution. It was voted on April 26 against a minority of nine by the whole of the rest of the House. Most of the Conservatives were amongst the majority; the minority consisted of a few Conservatives and the Independent Socialists. Württemberg was the second state of the Reich which deduced the consequence of the revolution by setting up a new constitution; Baden alone preceded it. The constitution of Württemberg naturally resembles that of Baden in many respects, but also differs from it in several important particulars. Moreover, the constitution which came into force on May 23 1919 was not definitive. As the constitution of the Reich had considerably restricted the rights of the separate states which composed it, a reconsideration of the constitution of Württemberg became necessary and large sections of it were eliminated. On Sept. 25 1919, exactly 100 years after the adoption of the first Württemberg constitution, the new constitution was finally voted.

The constitution of Württemberg could not fail to resemble that of the other German states, since the constitution of the Reich prescribes for all the states that they must be republics and have a parliamentary government. The powers of the state in Württemberg proceed from the people and are transferred by the people to the Diet; the people can, however, resume the powers of the state by dissolving the Diet or by giving a popular vote (*Volksabstimmung*) on a law. Such a vote may be passed either upon a referendum or upon a popular initiative. In contrast to Baden, there is no compulsory referendum.

The Diet transfers the executive power to the Government. At the head of the Government there is the Minister-President, who has the title of President of the State (*Staatspräsident*); but in Württemberg, as in Baden, there is no head of the state independent of the Diet. The Ministry is formed by the Diet's electing the President of the State, who selects the Ministry in accord with the Diet. (The same procedure is followed in Bavaria and Baden.) The administration, however, is not conducted by the Ministry as a whole, but by individual ministers. A peculiarity of the Württemberg constitution is that councils (*Beiräte*), formed from the different classes according to occupations (*Berufsstände*), are attached to the ministries. Elections for the Diet take place every four years. No provision is made for a dissolution of the Diet except that, as already mentioned, the Diet can be dismissed by a vote of the people.

The constitution of Württemberg was framed by those parties which restored order in the country after the revolution—the Social Democrats, the Democrats and the Catholic Centre. At the elections of June 1920 these parties, particularly the Social Democrats and the Democrats, were considerably weakened, while the parties to the Right and the Left of them gained. As in the Reich the result of the general elections compelled the Government to resign; the Württemberg Government took this course, although there was no absolute necessity. The new Government of Herr Hieber was composed of members of the Democratic and the Catholic Centre parties, but was nevertheless supported by the German People's Party (former National Liberals) and the Social Democrats. The change of government did not entail any essential alteration in the policy of Württemberg. (W. v. B.)

WYNDHAM, SIR CHARLES (1837–1919), English actor (*see* 28.872), died in London Jan. 12 1919. In 1916 he married, as his second wife, Miss Mary Moore, who had been for many years his leading actress and his partner in management. His last appearance on the stage was made in a revival of *Mrs. Dane's Defence* at the New theatre, London, in 1912.

WYNDHAM, GEORGE (1863–1913), English politician and man of letters, was born Aug. 29 1863, the eldest son of the Hon. Percy Scawen Wyndham, and grandson of the 1st Lord Leconfield. His mother was Madeline Caroline Frances Eden, daughter of Sir Guy Campbell, 1st baronet; and through her he was great grandson of Lord Edward Fitzgerald, the Irish rebel. He was educated at Eton and Sandhurst, obtained a commission in the Coldstream Guards in 1883, and served through the Suakin campaign of 1885. But his military career was a very short one. Interested as he was in soldiering, his eager temperament impelled him still more to adventure in politics and letters. He left the army in 1887, married Sibell Mary, daughter of the

9th Earl of Scarbrough, widow of Earl Grosvenor, mother of the 2nd Duke of Westminster, and became private secretary to Mr. Balfour, at the time Irish Secretary, a position which he held till 1892. In 1889 at the age of 26 he entered Parliament as Conservative member for Dover, and retained the seat till his death. In 1898 he was appointed financial secretary to the War Office, a post in which he distinguished himself during the Boer War, in particular by a brilliant defence, in the debate on the Address in 1900, of the conduct of his office in regard to intelligence and reinforcements. But his chief claim to political remembrance is based on his tenure, from 1900 to 1905 (after 1902 as a Cabinet minister), of the office of Chief Secretary for Ireland. Having been private secretary for several years to the most successful chief secretary of modern times, he started with a large store of experience, and his appointment was regarded with benignity even by the Nationalists on account of his descent from Lord Edward Fitzgerald. His early work in Ireland met with general approval. He developed enormously the policy of land purchase, which the Unionists had found to exercise such a calming and beneficial effect; and the Land Purchase Act which he successfully carried in 1903 was the most comprehensive measure of the kind ever submitted to Parliament. He entertained hopes of arranging some form of local government which should sufficiently meet Nationalist hopes; and with this in view appointed an eminent Anglo-Indian, Sir Antony (afterwards Lord) Macdonnell, who was known to be a decided Home Ruler, to the permanent secretaryship in 1902, giving him at the same time greater authority and wider scope than is usually conferred on a civil servant. The Unionist party, both in Ireland and in England, became suspicious of the tendencies of his administration, and he was driven to resignation. He never held office again, but he was very active in support of the causes which he had at heart, such as tariff reform, and woman suffrage; he was a keen critic of Lord Haldane's army reforms, and threw himself vigorously into the "die-hard" campaign of 1911.

This varied political activity was however but a portion of his life. He was also a man of letters, possessed of fine taste and a graceful style. Here his genius was stimulated by his friendship with W. E. Henley, who dedicated a book to "George Wyndham, soldier, courtier, scholar." His principal published work was an edition of *Shakespeare's Poems* (1898); but he wrote also on North's *Plutarch* and Ronsard. The Admirable Crichton of his day, he was keen alike on field sports and the arts, the friend and admirer equally of Cecil Rhodes and of Rodin, a railway director and a yeomanry colonel. Oxford, Edinburgh and Glasgow gave him honorary degrees; the two Scottish universities made him lord rector.

By his father's death in 1911, Mr. Wyndham came into possession of his beautiful house, Clouds, in Wiltshire. Two years later, at the early age of 50, he died in Paris, of congestion of the lungs, after only a few hours' illness. Lady Grosvenor survived her husband. They had one son, Lt. Percy Lyulph Wyndham, who followed his father in the Coldstream Guards, was married in 1913, a few weeks before his father's death, and was killed in action in France on Sept. 15 1914, leaving no child.

WYOMING (*see* 28.873).—The pop. of the state in 1920 was 194,402 as compared with 145,965 in 1910, an increase of 48,437 or 33.2%, as against an increase of 57.7% in the preceding decade. The density of pop. was two per sq. m. in 1920. The urban pop. (in places having 2,500 inhabitants or more) in 1910 was 43,221, or 29.6% of the whole; in 1920, 57,348, or 29.5%. The rural pop. was 102,744 in 1910, 137,054 in 1920. The cities in Wyoming having a pop. in 1920 of over 5,000 and their percentage of increase were:—

	1920	1910	Percentage Increase
Casper	11,447	2,639	333·8
Cheyenne	13,829	11,320	22·2
Laramie	6,301	8,273	23·5
Rock Springs	6,456	5,778	11·7
Sheridan	9,175	8,408	9·1

The increase of pop. has been chiefly elsewhere than in the southern parts of the state, which had been the first to be settled.

Agriculture.—The number of farms was 6,095 in 1900, 10,987 in 1910, 15,748 in 1920. The acreage of all crops was estimated for 1920 as 1,826,000. The number of sheep in 1919 was 4,000,000 valued at $49,200,000. In 1920 the number was 3,200,000 valued at $32,640,000, being one-fifteenth in numbers and value of the total sheep in the United States. The estimated product of wool in 1919 was 33,415,000 lb., the average weight per fleece 8·5 lb. The total number of neat cattle in 1919 was 1,180,000 valued at $75,580,000; in 1920 there were 869,000 valued at $47,370,000. Other figures are correspondingly higher for 1919. In 1920 there were 258,000 horses valued at $11,925,000; mules 4,000, valued at $360,000; and swine 63,000, valued at $1,159,000. Other agricultural products of Wyoming and their value in 1920 were as follows:—

Crop	Ac. sown	Production	Value
Hay, cultivated	740,000	1,850,000 tons	$22,200,000
Hay, wild, salt and prairie	360,000	360,000 tons	5,148,000
Oats	300,000	11,400,000 bus.	7,068,000
Wheat	254,000	5,080,000 bus.	6,858,000
Corn	65,000	1,560,000 bus.	874,000
Barley	28,000	1,008,000 bus.	1,109,000
Potatoes	27,000	3,375,000 bus.	4,050,000

The irrigated area was 1,133,302 ac. in 1909, 1,209,527 in 1919. In 1920 the acreage capable of irrigation was 1,799,361. There were, in 1918, 978,681 ac. of land used for dry farming.

Mining.—The annual gross value of Wyoming's mineral products at the places of production was estimated at $68,250,000 for 1920. In 1917 the state ranked ninth in the output of bituminous coal with 8,575,000 tons valued at $16,593,619; in 1918 it was 9,300,000 tons; in 1919 7,145,000 tons (the decrease being attributed to labour shortage). The largest product comes from Sweetwater, Lincoln and Sheridan counties. The total production of coal to the end of 1917 was 148,000,000 short tons. Copper mining has decreased, the annual production averaging in value about $200,000. The gypsum production in 1917 was 55,804 short tons valued at $197,867. The average output of iron ore was about 500,000 tons, worth $1,500,000 at the mines. A deposit of carnotite (uranium, radium), accidentally discovered near Lusk in Niobrara county, produced in 1919 71·86 tons valued at $382 per ton. Most important in the state's mining development is the petroleum industry. In 1918 the output was 12,596,287 bar., in 1919 13,580,000 bar., and the estimate for 1920 16,000,000 bar. of crude oil, valued at over $45,000,000 at the wells. There were 17 fields in the state where oil was produced for market. About one-half the state's output was from Salt Creek field in Natrona county. Converse county came next in 1919 with 3,267,302 bar., Hot Springs followed with 2,151,867 bar., and Park with 773,893 bar.

Manufactures and Railways.—Wyoming's manufactures continue to be of little relative importance, aside from the petroleum refining industry to which this great increase of 1919 is due. The following figures are from the census report:—

	1919	1909
Number of establishments	576	268
Persons engaged	8,095	3,393
Value of products	$81,445,394	$6,249,078
Value added by manufacture	39,194,866	3,640,889

Of the 8,095 persons engaged 3,057 were wage-earners in the steam railway construction and repair shops. Railway mileage in 1917 was 1,924 m. as compared with 1,623 in 1909.

Education.—The educational system was reorganized in 1919 by Act of the Legislature providing for an elective state superintendent of public instruction, a state Board of Education appointed by the state superintendent with the approval of the governor, and a commissioner of education appointed by the state Board with the approval of the governor.

History.—Wyoming in 1921 was still governed under its first constitution. The six amendments which had been adopted gave additional powers to the Legislature—notably for workmen's compensation measures, highway construction and protection of live stock from disease. An eight-hour day for underground work in mines was established in 1909. A direct primary law was passed in 1911, and a Mother's Pension Act in 1915, the latter to be administered by the county commissioners. A Public Service Commission was established in 1915, composed of members of the state Board of Equalization, with power to supervise and regulate any public utility doing business in the state. In 1919 a "blue sky" law was passed. In the same year the Executive Budget system was adopted. In 1921 a system of rural credits, to be managed by a Farm Loan Board, was provided for, and an Act passed allowing towns of 1,000 inhabitants or more to adopt the commission-manager form of government. By an Act of 1919 the commissioner of taxation was replaced by a state Board of Equalization with power to increase or decrease the assessed value of any class of property in any county. The law of 1909 limiting county taxes was replaced by the Act of 1911 grading the tax limit according to the assessed valuation of the county. A beginning was made in 1921 in the revision of the taxation system by provision for an effective inheritance tax. The bonded debt was reduced from $140,000 in 1910 to $99,000 in 1918, but in 1920 it was increased to $1,935,000, due to the issue of bonds for the construction of roads.

Wyoming has been normally a Republican state in politics, but Republican control was seriously threatened for some years, beginning with the Insurgent Republican movement of 1910. Joseph M. Carey headed that movement, and a combination of Insurgent Republicans and Democrats resulted in the election in 1910 of Carey as governor, and of a majority of Democratic state officials. But the Republicans retained their control of the state Legislature throughout the decade 1910–20, and controlled the judiciary until the Act of 1918 providing for election of judges on a non-partisan ticket. Frank W. Mondell (Rep.) was reëlected as the state's one representative in Congress in 1910 and in every succeeding election of the decade. Clarence D. Clark (Rep.) was reëlected to the U.S. Senate in 1910 and Francis E. Warren (Rep.) in 1912 and again in 1918. In 1914 John B. Kendrick (Dem.) was elected governor by a vote of 22,387 to 19,174 for his Republican competitor; in 1916 he was elected to the U.S. Senate over Clark (Rep.) by a vote of 26,324 to 23,258. In 1918, however, the Republicans won the elections by substantial majorities, and in 1920 they swept the state for both state and national tickets. The presidential vote in 1912 was 15,310 for Wilson, 14,560 for Taft, and 9,232 for Roosevelt; in 1916 it was 28,316 for Wilson and 21,698 for Hughes; in 1920 it was 35,091 for Harding and 17,429 for Cox.

During the World War Wyoming supplied to the U.S. army 11,393 men, to the navy 638, and to the marine corps 111. The subscriptions to the war loans, in each case exceeding the state's quota, were as follows: First Liberty Loan, $1,568,900; Second, $5,132,650; Third, $6,737,000; Fourth, $10,183,150; Victory Loan, $6,862,250.

The recent governors have been: Joseph M. Carey (Prog.), 1911–5; John B. Kendrick (Dem.), 1915–7; F. L. Houx (acting, Dem.), 1917–9; Robert D. Carey (Rep.), 1919– . (L. A. W.*)

YALE UNIVERSITY (*see* 28.899*).—In 1919 President A. T. Hadley announced his decision to resign the presidency of Yale at the close of the university year; and on June 22 1921 his successor, James Rowland Angell, was inaugurated. Developments in 1910–20 were marked in many respects. The university's endowment increased from $11,967,166.29 to $24,048,730.45. The university began to be the beneficiary under the will of the late John W. Sterling of New York City, a graduate of Yale College, of about $20,000,000, held by trustees for the university under his bequest. The money was to be used for memorial buildings and devoted "to some extent to the foundation of Scholarships, Fellowships or Lectureships, the endowment of new Professorships and the establishment of special funds for prizes." At the same time the university's property holdings were augmented, and several important buildings constructed, including the Osborn Memorial Laboratories, the Sloane Physics Laboratory, the Dunham Laboratory of Electrical Engineering, the Mason Laboratory of Mechanical Engineering, Sprague Memorial Hall (Music), the Brady Memorial Laboratory (Pathology), Artillery Hall and the Artillery Armoury, and the magnificent Memorial Quadrangle, the gift of Mrs. Stephen V. Harkness, of New York City. This quadrangle includes seven courtyards in collegiate Gothic, designed by James Gamble Rogers of New York City, and erected at a cost of several million dollars. It is recognized as one of the most perfect groups of modern Gothic buildings in the world.

The number of students in 1920 who were candidates for a degree was 3,214, practically the same as ten years earlier. Educationally the university underwent a thorough reorganization in its administrative and educational system to meet modern conditions. The medical school was allied to the New Haven hospital and placed on full-time basis; the law school introduced the requirement of a college degree for entrance, except for Academic Seniors; the undergraduates' courses in the Sheffield Scientific School were placed on a four-year basis; and the higher engineering degrees were transferred from the scientific school to the graduate school. Several new university officers were appointed, including a Provost, who represented the Faculties before the Corporation and assisted the President in the educational administration of the university; the Dean of Students, who was primarily concerned with student *moral;* and a Dean of Freshmen, who had under his jurisdiction all undergraduate freshmen. These were formed into what is called the Freshmen Year, at the close of which undergraduates pursued three years of study in the Sheffield Scientific School leading to the degree of Bachelor of Science, or three years of study in the college leading to the degree of Bachelor of Arts, or in the case of students without Latin, Bachelor of Philosophy. The admission of all students was centralized in a Board of Admissions, under a chairman appointed by the Yale Corporation.

In connexion with the literary activities of the university the Yale University Press was started in 1908, by Mr. George Parmly Day, the treasurer of the university, under an agreement with the university by which all books published and bearing the Yale name must receive approval in advance by the Yale University Council's Committee on Publications. The Press was affiliated with the Oxford University Press, and became an important publishing agency in America for works of a literary and scholarly character. The number of books published in 1919 was seventy-eight. The number of books sold was 184,145. The *Yale Review* was transformed in 1911 into a quarterly review under the editorship of Wilbur L. Cross, Dean of the Yale Graduate School, and it is recognized as one of the most representative organs of sober thought in America.

Eight thousand Yale men, including graduates, former students and students, entered the military and naval services of the United States during the World War. The university had the most important artillery school in the country outside of Fort Sill and Camp Zachary Taylor. It also had one of the largest naval training units, and was the centre of the scientific work of the chemical warfare service. It was also the seat of the leading army laboratory school. Two hundred and twenty-five Yale men lost their lives in the service of their country. A memorial has been dedicated in their honour. (A. P. S.)

YAMAGATA, ARITOMO, PRINCE (1838–1922), Japanese field-marshal (*see* 28.902), died in Odawara, Japan, Feb. 1 1922.

YANUSHKEVICH, NIKOLAI (1868–), Russian general, was born in 1868 and entered the army in 1888. He passed through the academy of the general staff, and was appointed on the general staff. By 1909 he had reached the rank of general, but all his service was spent in the offices of the War Ministry, out of contact with troops. Very strict as a bureaucrat, he earned the special favour of the War Minister, Sukhomlinov, and, though he was quite untrained in the leading of troops in modern warfare (at the academy of the general staff he had taken an administrative course), he was, thanks to his even temper and enterprise, quickly promoted to the higher posts. Just before the World War he was appointed head of the general staff. Unable to introduce improvements, he limited himself merely to formal direction, which toned in well with the régime which the careless War Minister, Sukhomlinov, had established. With the declaration of war Yanushkevich, as head of the general staff, became the head of the staff of the supreme commander-in-chief. But at the commencement of operations, feeling himself completely unprepared for leadership on active service, he withdrew and left the work in the hands of his subordinates.

YARMOUTH (GREAT YARMOUTH), Norfolk, England (*see* 28.905).—The pop. had increased from 55,905 in 1911 to 60,710 in 1921. A new art school was opened in July 1913, and the esplanade was extended northward by about ¼ m.; in 1921 a town-planning scheme of a very comprehensive nature was in course of preparation. Yarmouth was subjected to zeppelin and other aircraft raids on Jan 19 1915, April 24 1916, and Jan. 14 1918, and was bombarded from the sea on two occasions (Nov. 3 1914 and Jan. 26 1915); the material damage was slight.

YEATS, WILLIAM BUTLER (1865–), Irish author (*see* 28.909). In 1911, after the death of his friend J. M. Synge, Yeats wrote the essay *Synge and the Ireland of his Time.* His fervent Irish nationalism had been tried somewhat during his encounter with a section of the Irish public at the time of the *Playboy* disturbances in the Abbey theatre, and was further tried when the Dublin corporation refused a building for Sir Hugh Lane's collection of pictures. These affairs suggested to him a good deal of topical verse, especially in the most important of his later volumes, *Responsibilities* (Cuala Press, 1914). The volume includes the lines, familiar now in Ireland, "Romantic Ireland's dead and gone"; and as if to dwell a little longer in the Ireland of his earlier years, he wrote an account of these in *Reveries over Childhood and Youth* (1915). In his poetical work, from this period, he seemed to write with Synge's ideal of the poet in his mind, as one who "uses the whole of his personal life as his material." *The Wild Swans at Coole* (1917) marks the beginning of his preoccupation with the special doctrines expounded (1918) in *Per Amica Silentia Lunae*, a little prose treatise which the reader who wishes to understand Mr. Yeats' later work must study. Some of the poems in *Michael Robartes and the Dancer* (1920) are concerned with the events of 1916 in Ireland (the volume contains a sort of palinode to "Romantic Ireland's dead and gone"), but the author had become more and more a poet of esoteric doctrine. In literature and on the platform he had become a champion of belief in survival after death, a subject which interested him chiefly because of the possibility it offered of necromancy and "magic." "I have always," he says, "sought to bring my mind close to the mind of Indian and Japanese poets, old women in Connaught, mediums in Soho."

**** These figures indicate the volume and page number of the previous article.***

He was one of the first to welcome the English poems of Rabindranath Tagore, for whose *Gitanjali* he wrote an introduction. Another late influence with him was represented by the Noh-plays of Japan, and he wrote an essay on the subject which is included in the prose collection, *The Cutting of an Agate.* Under the Japanese influence he wrote his plays *At the Hawk's Well* (1917), and *Two Plays for Dancers* (1919). He married in 1917 Georgia Hyde Lees, by whom he had first a daughter and in 1921 a son.

An elaborate critical study of Mr. Yeats' poetry, by Forrest Reid, appeared in 1916; also, in the series "Irishmen of To-day," *W. B. Yeats: The Poet in Contemporary Ireland*, by J. M. Hone; there is a good account of Yeats' work in *Ireland's Literary Renascence*, by Ernest A. Boyd (1916).

YELLOW FEVER (*see* 28.910).—In 1918 the study of this disease was carried a stage forward by the discovery of Noguchi that the disease could be transmitted to guinea-pigs, and that the blood of these, examined by dark-ground illumination, contained numbers of a delicate Spirochæte which he called *Leptospira icteroides.* This organism is closely allied to the *Leptospira icteroidæ morrhagiæ*, the organism of infective jaundice.

It was found possible to cultivate the new organism under anærobic conditions without excessive oxygen supply in solid media containing blood serum. Different strains of the organism vary greatly in virulence. Some are so virulent that 0·0001 c.c of a culture is sufficient to induce fatal symptoms in a guinea-pig. The organism is killed within ten minutes at 55° C. and by desiccation or freezing. It is an extremely delicate filament, 4–9 μ in length by 0·2 μ in breadth. It breaks up into a number of refractile granules, and the virus can pass through Berkefeld filters V. & N. The organism is scanty in the blood of yellow fever patients.

Those early statements were confirmed by later work, and the chain of evidence in favour of this organism being the cause of Yellow Fever was well-nigh complete by the middle of 1921. Noguchi prepared a serum by infecting horses with his organism, and this exercised marked curative effects on guinea-pigs when administered within a short period of the time of infection. It was further found possible to infect a guinea-pig from a culture of the organism and then use a mosquito (*Stegomyia fasciata*) to carry the infection from this animal to another. The whole course of the disease could thus be reproduced by means of new organism. (R. M. Wi.)

YOSHIHITO (1879–), 122nd Emperor of Japan, third son of the Emperor Meiji (Mutsuhito), was born on Aug. 31 1879, at Tokyo. The Prince was physically somewhat weak during his early life and Marquis Tadayasu Nakayama and Marchioness Nakayama were appointed his guardians. On the eighth anniversary of his birthday the Prince was proclaimed heir apparent, the first and second sons of the Emperor Meiji having died in infancy. In Sept. 1887 the Prince commenced attending the Peers' school and on Nov. 3 1889 he was declared Imperial Crown Prince. In 1892 the Crown Prince was appointed to the rank of a first lieutenant in the imperial army, and two years later left the Peers' school to continue his studies at the palace under private tutors. In 1895 he was promoted to the rank of captain and in 1897 took his seat, in accordance with prescriptive right, in the House of Peers. In 1898 he was promoted to the rank of major of infantry and appointed a lieutenant-commander in the imperial navy.

On May 10 1900 the Crown Prince married Sadako, fourth daughter of the late Prince Michitaka Kujo, and on April 29 1901 a son, Hirohito, was born, followed by a second son, Prince Yasuhito, on June 25 1902, and a third, Prince Nobuhito, on Jan. 3 1905. In 1903 the Crown Prince was promoted colonel in the army and captain in the navy and in 1909 lieutenant-general and vice-admiral. On July 30 1912, at the moment of the demise of his father, the Crown Prince ascended the throne; but, owing to the national mourning, the formal ceremony of enthronement did not take place until Nov. 1914. In the following year a fourth son, Prince Takahito, was born on Dec. 2.

YOUNG MEN'S CHRISTIAN ASSOCIATION (*see* 28.940).—For several years before the World War the British Y.M.C.A. had been doing effective work in the summer camps of the Volunteers and Territorials. When the war started it had therefore the necessary experience, together with trained personnel and a programme adapted to meet the needs of men on active service. It entered the field at once, and within ten days of the outbreak of war had opened up 250 different centres for the recreation and welfare of the troops in all parts of the United Kingdom. The whole organization of the Y.M.C.A. was brought to bear on the national emergency, and the Red Triangle, unknown before the war, soon became as familiar as the Red Cross itself. It touched the men at every point and in almost every place. It became a habit—they found it in the training camps; the base camps overseas; the support trenches, and sometimes even in those in the front line. The Y.M.C.A. meant warmth, shelter, comfort and rest to the soldier on active service under Christian auspices. It was a counter-attraction to the "wet" canteen, and helped to keep the men from undesirable places in the towns and villages adjacent to the camps. It kept them in touch with home—more than a thousand million sheets of writing paper and envelopes being sent out from headquarters in London for free distribution at home and overseas. The steadying effect of the work on the *moral* of the men was universally admitted. Sports and competitive games were organized on a large scale by the Association at a time when the army authorities had no leisure to devote to looking after the recreation of the troops. Education classes and lectures were included in the programme, and the Y.M.C.A. was appointed agent for carrying out the army scheme of education on the lines of communication in France. From May 1918 till the end of the following year 70,067 separate students were enrolled in the educational classes, and over 670,000 attended the lectures on the lines of communications. Wimborne House, London, was loaned by Lord Wimborne as headquarters of the overseas library, and more than a million books and magazines were sent to the front. The total cost of the educational work, which was carried out under the direction of a special committee on which all the universities were represented, exceeded £140,000. More than 150,000 concerts by professional artists were given, and in every case admission was free.

The primary object of all the work of the Association was the building and safeguarding of character. Religious work amongst the troops was organized on an extensive scale. Testaments, Gospels and religious booklets were distributed in hundreds and thousands. Family prayers in the huts usually closed the proceedings for the day, and, wherever possible, a quiet room or chapel was included as part of the equipment. Many distinguished preachers and evangelists served with the Y.M.C.A. The huts and tents were placed at the disposal of the official chaplains—Protestant and Catholic alike—every Sunday morning, and similar facilities were extended to the Jewish chaplains.

Personnel.—Twelve members of the Y.M.C.A. won the Victoria Cross during the World War, and the names of 2,621 are inscribed on the Roll of Honour in the central building in Tottenham Court Road of those who were killed or died when on active service. For its war work the Association had to depend almost entirely on men over military age or disqualified for active service, together with clergy and ministers of all denominations, whilst for the first time in its history women took a considerable part in the executive work of the Association. At one time there were as many as 40,000 ladies working under the Red Triangle. A splendid lead was given by H.H. Princess Helena Victoria, ably assisted by some of the leading ladies of the United Kingdom.

The Navy and Mercantile Marine.—During the war men of the Royal Navy had comparatively little shore leave, but many large institutes were opened in the naval bases and extensively used. After the Armistice work was opened up for the men of the British fleet based on Copenhagen. Y.M.C.A. cabinets, each containing a small library, writing materials, games, a gramophone and records, were supplied gratis to 200 centres for the use of men serving on coastguard, wireless, hydrophone and war signal stations.

Munitions.—To meet an urgent national need the Munition Workers' Auxiliary Committee was formed in 1915, with H.H. Princess Helena Victoria as president and Lord Derby as chairman. Two hundred canteens were opened before the end of 1918 in shell factories and other munition centres. Fifteen large hostels were established and more than 50 million meals supplied at cost price. Seven thousand voluntary women workers assisted. Lectures and concerts were given.

Prisoners of War.—In 1915 welfare work was initiated in the German prisoner-of-war camps at home by the late Mr. F. L. Porter, of the English National Council, but ultimately it was handed over to the American Y.M.C.A., and under their aegis extended to most of the European countries. In the British internment camps in Switzerland centres were opened at Murren, Leysin, Seeburg, Interlaken and Geneva, whilst in Holland the Association operated at Groningen, The Hague, Scheveningen, Rotterdam, etc.

Officers.—A similar work for officers to that carried on for the ordinary soldier was developed on the same lines, though on a smaller scale. The late Lord Brassey lent his mansion in Park Lane as a Y.M.C.A. club for overseas officers, and hostels were opened in London and the provinces, and also overseas.

Y.M.C.A. Work in London.—Tottenham Court Road, the White City and the Crystal Palace were amongst the biggest centres of Y.M.C.A. activity in London during the war. Ciro's was a popular mixed club. £250,000 was spent on erecting and equipping hostels for troops passing through the City, and from Dec. 1 1918 to Aug. 13 1919 1,359,494 service men slept in the Y.M.C.A. hostels in the metropolis, and 1,068,913 in those in the provinces. The grand total from Jan. 1916 to Nov. 1919 was 5,478,774. Primarily for the benefit of overseas troops, enquiry kiosks were opened up by the Y.M.C.A. International Hospitality League in Trafalgar and Leicester Squares, Charing Cross, Victoria and Euston stations, the Strand, and in Parliament Square. From Jan. 1918 to April 1921 826,338 men were dealt with by Y.M.C.A. street patrols; 1,195,496 were welcomed in the social rooms; 55,008 provided with free hospitality and entertainment in private homes; thousands of men were taken from the streets and assisted to their quarters; 301,548 were kept from the temptations of the streets by free entertainments in theatres and other places of amusement; 170,637 were piloted round historic London by honorary guides, whilst no fewer than 2,197,840 enquiries were actually registered at the enquiry bureaux.

Motor Transport.—969,970 service men on leave were conveyed free of any expense from station to station and from hut to hut by the Y.M.C.A. volunteer night motor transport during the war, and 254,000 after the Armistice. These figures apply to London alone, but similar service was rendered in many other parts of the country.

On the Western Front.—The Y.M.C.A. started work for the men of the B.E.F. in France in Nov. 1914. Centres were opened in all the bases, and, later, the Red Triangle appeared on ruined buildings, cellars and dug-outs up the line. In the great German advance in the spring of 1918 no fewer than 198 Y.M.C.A. centres were destroyed, involving a loss of £158,000. At the time of the Armistice there were more than 1,700 workers in France. Specialized work was carried out for Chinese coolies in 124 huts, and many centres were devoted to the use of the Indian troops and others opened for the Portuguese. 69,300 service men on leave stayed in the three Y.M.C.A. hostels in Paris. Seventy-seven Y.M.C.A. cinemas in France were attended by 35,000 men nightly. Y.M.C.A. service to the walking wounded and to the relatives of the dangerously wounded was given free of charge, and after the war many of the huts were retained as hostels for relatives visiting graves, and others for men working in the devastated areas.

In Italy 82 centres were operated by the Y.M.C.A.

Y.M.C.A. Work in the East.—There were 10 Y.M.C.A.'s in Malta, serving especially the hospitals and convalescent camps, and one in Gibraltar.

The Indian National Council did effective war work in Egypt and Palestine, France, England, Mesopotamia, and also in East Africa, where there were 51 war Y.M.C.A.'s, 32 being for British troops, 6 for Indians and 13 for Africans. In India there were 115 war Y.M.C.A.'s, 74 for British and 41 for Indian troops, and altogether 412 full-time salaried officers were employed. In Mesopotamia 102 centres were operated by 100 secretaries. The Y.M.C.A. had two steam launches on the Tigris. In Egypt there were 15 centres in and around Cairo, where the *bourse* was acquired as a hostel for troops, and the Esbekia gardens as a recreation centre. The Y.M.C.A. penetrated south as far as Khartoum and Port Sudan, and was established in 35 centres in the canal zone, 6 in Alexandria, and others in Cyprus, Beirut, Suez, Port Said and Aden. In Gallipoli work was opened up in Anzac Bay and at Cape Hellas. Thirty-five centres were opened in the base camps in Palestine and 25 actually in the front line, with extensions as far as Damascus and Aleppo. There were 65 on the Salonika front, and others in the islands of the Aegean and Adriatic. In 1915 a relief ship, the s.s. "Nero," was despatched with comforts and delicacies for the men serving in the Dardanelles.

Russia.—The main operations of the Association commenced in July 1918, and continued until the evacuation of the North Russian Expeditionary Force. In the Archangel district 35 centres were opened and 4 railway coaches were equipped as mobile Y.M.C.A.'s. In the Murmansk district there were 21 centres.

The Armistice.—With the close of hostilities a much wider field had to be covered; the men were more scattered, and transport—never easy—became increasingly difficult day by day. With the Armistice there came a constant flow of repatriated prisoners of war across the frontiers, whose first contact was with the Y.M.C.A. The men were practically starving, and more than 7,000 were fed in Brussels alone, whilst large numbers were dealt with at Mons, Rotterdam, Aachen, Antwerp, Valenciennes, Vermelles, Nancy, Metz, Amiens, Lille and other centres. At all of these places, as well as at Cannon Street station in London, refreshments were given free at a cost to the Association of £50,000.

The Y.M.C.A. accompanied the British troops to Germany, and 5 big centres were opened up in Cologne, 3 at Düren, 79 for the use of corps troops, 6 on the lines of communication, and 8 on the Rhine demobilization boats.

Operations were on a big scale in Belgium, where a very strong Belgium Y.M.C.A. developed. Five thousand meals were served daily at the central Y.M.C.A. in Brussels, where there was sleeping accommodation for 1,600 men. The Hotel Weber was the largest Y.M.C.A. in Antwerp. Big centres were opened in Namur, Bruges, Ghent, Mons, Tournai, Roubaix, Aachen, Liége, Ostend, Zeebrugge, Spa, Beverloo and other places.

In Constantinople there was a large central Y.M.C.A. and tea gardens overlooking the Golden Horn, whilst several other branches were opened in the vicinity. In the Dardanelles centres were opened at Chanak, and Kum Kale. In the Caucasus there were centres at Batum, Tiflis and Baku. In southern Russia at Taganrog, Novorossisk and Ekaterinodar. There were eight posts on the Vardar and Doiran fronts. A mobile railway Y.M.C.A. ran between Salonika and Constantinople. There were three Y.M.C.A.'s on the Danube, and seven along the Anatolian railway.

In Serbia centres were opened at Monastir, Uskub, Velles, Nish, Belgrade and Mitrovitsa.

Work for Ex-soldiers.—During the closing stages of the war a Y.M.C.A. labour exchange was opened in London. Within two and a half years 29,000 ex-service men had been placed in situations, and more than 19,200 enquiries registered regarding pensions, allowances and other matters of vital interest to the ex-soldier. Seven large hostels and many huts were set aside for the use of demobilized men in London, and others in the provinces. Training schemes were carried out at Kinson (Dorset), Woldingham and in London.

Finance.—The total net cost of the work in all the war areas (excluding goods purchased for sale) was £8,189,406. This cost was met as follows: gifts from the public, £2,848,374; grants from American, Canadian and Australian Y.M.C.A.'s, £448,082; *gross* "profits" on sale of refreshments, £3,625,522; receipts from beds, baths and billiards, £369,756; proceeds of sales of properties and equipment, £212,574; sundry other receipts, £78,321; payment by War Office in respect of services rendered, £610,500. That left the Association with a surplus in hand of £3,723 with which to begin its extensive and costly after-war work for the troops.

It is interesting to note that out of every £1 spent on the war work of the Y.M.C.A. 6s. 11d. came from the public; 1s. 1d. from the American and Dominion Y.M.C.A.'s; 9s. 9d. from *gross* "profits" on sale of refreshments and receipts from beds, baths and billiards; 9d. from the sale of properties and equipment and sundry sources; 1s. 6d. from the War Office.

It will thus be seen that there were no net profits from the war work whatever. Every penny of the *gross* "profits" on sales of refreshments, etc., was spent upon the work, and the Y.M.C.A. had every reason to be proud of its business record in this matter. The prices to be charged were fixed by the military authorities, so that there was no question of profiteering. The Y.M.C.A. began without any intention of becoming a trading concern in any respect, but it was soon evident that by supplying cheap refreshments it had its biggest opportunity. The scope of the work was enormous; the total sales amounted to £17,387,804, and the percentage of *gross* "profits" was 20·8. The great bulk of the turnover consisted of the sale of penny cups of tea, penny buns, etc. No less a sum than £991,216 was returned to the troops in the form of direct gifts, including free stationery, games and sports, concerts and lectures, hot cocoa and refreshments given free at night in danger areas; to the walking wounded; to returning prisoners of war, and in hospitality to the relatives of the wounded. (A. K. Y.)

UNITED STATES

The activities of the American Y.M.C.A. in connexion with the World War were so extensive and novel in character that its normal routine of work was eclipsed. But the usual educational and physical work continued through the decade 1910–20 and the Association experienced a healthy growth. In 1910 there were in the United States and Canada 2,017 associations with 496,591 members, of whom 91,756 were boys; the total operating expenditures were $7,809,625, and the total net property and funds $60,377,122. In 1920 there were 2,194 associations with 868,892 members, of whom 199,615 were boys; the total operating expenditures were $38,484,800, and the total net property and funds $128,019,000. In the summer of 1916 when the National Guard was sent to the Mexican border, the Y.M.C.A. followed and afforded help and means of recreation for some 150,000 troops. For this purpose over $300,000 was raised during its eight months' service there, and 42 buildings and 6 tents were provided as social centres. The estimated attendance at entertainments during that period was 2,851,316, and free stationery for over 5,000,000 letters was furnished.

The Y.M.C.A. began its work in Europe immediately after the outbreak of the World War in 1914. It helped the French and British troops in Europe and the Near East and the Russians. Arrangements were made with the belligerents, both Allied and Teutonic, for assisting prisoners of war. Huts were erected in the various prison camps, secretaries detailed, and recreation provided for large groups of restless men. In conjunction with the Red Cross, kitchens were built and attendance provided for the sick. During the first 17 months of the war $300,000 was raised in America by the Y.M.C.A. for this work. Before America entered the World War in 1917 the Association had expended in Europe more than $1,500,000. Immediately after the breaking of relations between the United States and Germany the Y.M.C.A. offered its services to the U.S. Government and the offer was accepted. A week later the War Work Council of the Association was organized, and to it was given the task of adapting the usual Association programme of recreation, education, and religious work to the needs of the national army. This Council was composed of some 200 well-known business and professional men, with some members of the Association. Considerable experience in work with soldiers had already been gained by the Association, as noted above. Its activities had made the organization known to military authorities in all countries, and had given it a body of men trained for the new task.

The local Associations in the United States at once opened their buildings and offered their advantages to all men in the U.S. service, an arrangement that continued till three months after demobilization. The raising of funds was put in charge of men prominent in their communities. The first drive was made during one week in April and May, and the second in Nov., the two raising over $58,000,000. The final drive was that of the United War Work Campaign the Association's share of which was $100,760,000. Committees, corresponding to the military departments into which the United States were divided, were formed to secure men and women for the work at home and abroad, the headquarters at New York having special oversight of those going overseas. When the nature of the overseas work and the need of large numbers of secretaries became clear, each candidate was required to take a week's course of preparation, that for the women being held at Barnard, that for the men first at Princeton and later at Columbia University.

Within a month after the declaration of war huts were equipped in the permanent camps already opened in the United States. During the two years following 1,200 of these stations were carried on for the men in training; 952 of them were huts built by the Association, most of them being ready on the arrival of the men. Huts were opened also in the munition and shipbuilding and other government plants, as well as in the internment camps, and work was continued with the troops on the Mexican border, at Panama and in the Philippines. Workers were on more than 5,000 troop trains, and also on the transports, where they showed motion pictures and supplied games, reading matter and such small conveniences as the men lacked. Over 12,000 men and women were on the regular staff, carrying on the varied duties of the hut and transportation service, and besides these were hundreds who gave part time.

The type of building used in the home camps and overseas had been adopted by the Association during service on the Mexican border. It was a wide, low structure, of upright boarding, easily transported in sections. One large room served in the smaller camps as lounge, writing and reading room, library, gymnasium, theatre, church and restaurant, while in the larger camps smaller rooms opening from this main room separated the different activities. The plan of the Association was to provide the men with attractive meeting places, conveniences for letter writing, books, papers, athletics, entertainments, classes and religious services. Lecturers, musicians and actors were on circuit among the huts, and motion pictures, carefully selected by the Community Motion Picture Bureau, were given at most points twice a week.

The work for the American Expeditionary Force in Great Britain, France, Italy, and Siberia, although of shorter duration than that in the United States and reaching fewer men, attracted more attention both because it was carried on under greater difficulties and because it developed features entirely new to welfare work among soldiers and sailors. In Great Britain Eagle Hut in the Strand, London, was the first of the 1,500 "huts" or stations, ranging from hotels and large buildings at sources of supplies to dugouts in the Argonne, which within 14 months were established overseas. More than 8,000 Y.M.C.A. men and women worked overseas with the A.E.F. between July 1917 and Dec. 1919.

The acceptance by the Y.M.C.A. of the army post canteen service, at the request of Gen. Pershing, which set free for military duty many hundreds of officers and soldiers, added greatly to the task of the Association, and being a business foreign to its programme and new to its personnel was handled with much difficulty. In connexion with this work the Y.M.C.A. met with much criticism, some of it probably warranted, much of it hardly fair under the circumstances. Under Gen. Pershing's orders the Association was to obtain the goods, purchasing in the open market, and to sell at prices covering the cost and the transportation charges. The first cargo of supplies was torpedoed. As the sending over of troops increased it became more difficult to secure transportation for the Y.M.C.A. supplies. The Association was therefore early forced to open factories in France, 42 in all, and to manufacture for itself huge quantities of chocolate, cocoa, biscuit, candy and jam, just as it had to manufacture paper in Spain to supply its stationery. This meant high cost and therefore high prices for the commodities and a dissatisfaction among the men purchasing them. Initially the prices charged by the Y.M.C.A. were higher than those charged by the quartermaster's department of the army, and this led to a suspicion, unfounded though very prevalent, that the Y.M.C.A. was seeking to make a profit at the expense of the fighting men. Resentment on this score was increased because of the belief that the people of the United States had contributed huge sums to the Y.M.C.A. for the purpose of giving free supplies to the soldiers. But the Y.M.C.A. had expressly decided at the outset not to give away supplies except at the front lines, and it never solicited funds for this purpose. The prices charged in the canteens were later reduced, and for the most part goods were sold at a loss. At the request of the Association the canteen service was taken back by the army after the Armistice, when officers and men could be spared for this work. Had not the Governments of the United States and France decided to remit transportation charges to all the welfare organizations, the Association would have lost about $1,500,000 on its post canteen service. With the remission of these charges, however, it found itself with a balance of $500,000, which was handed over to the American Legion.

Secretaries were attached to each division of the A.E.F., but whether they should go forward with the troops, or how many should go, was decided by the individual commander. The work at the front consisted of the free distribution of cigarettes and whatever other supplies could be brought up, the serving of hot chocolate to the passing troops and work in the field hospitals and dressing stations, the front being the one place where the Association was allowed to work for the wounded. Over 700 Y.M.C.A. men and women were under fire, at Soissons, at Château-Thierry, in the St. Mihiel drive, and in the battle of the Argonne. Fourteen lost their lives and 133 were wounded or gassed in the battle zone, while 67 died from accidents or other causes. The Croix de Guerre was awarded to 41 and the Distinguished Service Cross to four. The entire personnel attached to 12 of the divisions was officially commended for front line service. Two hundred and fifty secretaries, both men and women, were either decorated or received special mention for their services.

Religious work, always a part of the Association programme, continued overseas as in the home camps. The huts were open for services of all faiths. There was always one service on Sunday, sometimes two, and sometimes another during the week. In many of the leave areas there were services daily. Most huts also had classes for Bible study. A special collection of hymns was prepared for use in the huts; much religious literature and many Testaments and portions of the Bible were distributed. A number of well-known clergymen, who had proved their strength with soldier audiences, made a circuit of the army, song leaders often going with them. Direct effort in the line of social purity was made by the Association, both in its practical work with the Hospitality League, on the streets of Liverpool, London and Paris, and in lectures in the huts by men specially fitted for this work.

The entertainment work in England and on the continent began in the fall of 1917 with a few musicians and speakers. Under E. H. Sothern and Winthrop Ames the Over There Theatre League was formed, and under its care singers, actors, magicians, professional entertainers of all sorts, were enlisted for the entertainment of soldiers both in the United States and overseas. The Entertainment Department of the Association and the League together recruited over 1,400 entertainers, many of whom, after the Armistice, became trainers of the 15,000 soldier actors and musicians who made up the soldier shows of the A.E.F. For this department the Association provided instruments, music, costumes, and finally really entered the dramatic profession as owner of four "play factories," which were the centres of training and equipment for the soldier shows. Motion pictures were supplied regularly to all the huts, and were often given in the French village streets where there was no adequate building, and on the roadside, as with the troops on the march into Germany. Films were supplied to U.S. troops in Great Britain, Italy, and Siberia, to the French *foyers* and the Italian *case*, to the Chinese labour battalions, the Portuguese and Russian troops in France, and the prisoners of war. Besides this the Association furnished films to all the other American welfare organizations overseas.

The question of what to do with the American soldiers on leave began to concern both French officials and American officers almost before any men had reached France. The Association proposed that it should take over certain regions, chosen by the French Government and run them as pleasure grounds for soldiers' holidays. The first opened was at Aix-les-Bains which was followed by 35 others the largest being those on the Riviera. Here some of the most famous pleasure resorts of Europe were thrown open to the enlisted men. Many casinos became their clubs. Sight-seeing trips, dances, tournaments, concerts, plays, and motion pictures were provided, and more than a million men were given decent and wholesome enjoyment while on leave.

Though French classes and lectures were provided at the permanent camps by the Association little educational work was done before the Armistice. An educational plan for the whole army, however, was then ready. It included classes for all grades from illiterates to university students, and made use of teachers found in the ranks as well as those brought from the United States for the purpose. It also included privileges at French and English universities. In March 1919 the entire educational work was turned over to the Army Educational Commission. Though demobilization went on too rapidly to permit a full test of this work, it showed itself to be so practical and valuable that it was adopted as a regular part of the U.S. army system.

A special feature of the Association work overseas taken over by the U.S. army was the use of women as welfare workers in the camps. Women were accepted in order to save men for military service, but their duties were supposed to be confined to preparing and serving food. Distinctions of sex in service, however, disappeared under the pressure of work, and women managed *cafeterias* or concerts, religious meetings or "hikes," led dances or maintained "mother's corners," were decorators or scrubbers, as need arose. So evident was the acceptability of service by women that not only have women been included among the welfare workers under the U.S. War Department, but the Associations in the armies of Greece and Poland and the French *foyers* include them in their personnel.

The Soldier's Remittance Bureau was established to meet the difficulty the soldiers had in reaching the army post offices. By this plan any secretary, anywhere, could send a soldier's money home for him free of charge. Money was thus taken not only at the sources of supply but at the front, where days might pass before it could be handed in at the local headquarters, and many more pass before it could reach Paris, by the usual channels. These remittances numbered 351,468, and were sent to destinations in many countries. Only 92 remained undelivered by reason of wrong address or the disappearance of the payees. The soldiers sent home in this way, free of charge, $1,558,339, the average length of time from acceptance to delivery being 62 days.

The favourite athletic recreations of the A.E.F. were informal baseball and group games until after the fighting was over. The Association's part in such activities before the Armistice was mainly in supplying equipment. But before Nov. 11 1918 the physical directors of the Association had proposed an inter-allied meet to celebrate victory. This plan was laid before the commander-in-chief, and, shortly after the close of hostilities, was approved and a committee appointed consisting of two officers and two Association men. The invitations to the Allies were sent out by Gen. Pershing, and the training of teams throughout all the armies went on during the winter of 1918–9. In the meantime a large stadium was building near Paris, the labour being given by the army, the land by the French, and the plans and the material supplied by the Association. For a fortnight in June and July 1919 1,500 contestants competed, representing 18 countries, all fellow soldiers in the World War.

As the result of an increasing volume of criticism, much of which, as already noted, was concerned with the conduct of the canteen service, the Y.M.C.A. in Dec. 1918 invited a committee composed of George W. Perkins, Mortimer L. Schiff and F. S. Brockman, none of whom had been connected with the Y.M.C.A. before the war, to go to France and make an investigation. Subsequently the War Department also undertook an inquiry. In the meantime the attitude of returning soldiers made it evident to the people of America that in France, at least, the Y.M.C.A. was held in less regard by the A.E.F. than certain other welfare organizations. Apart from the canteen question, soldier opinion seemed to point first to an unfortunate selection of some of the Y.M.C.A. personnel, and second to a well-meaning but sometimes officious effort to promote the moral and religious welfare of the A.E.F. It is clear that the validity of such criticisms will depend somewhat on the point of view. In his report on the work of the Y.M.C.A. Mr. Perkins, as chairman, said that in civilian life an organization that is 90% efficient is regarded as satisfactory. "If 10% of the 11,229 people operating in France for the Y.M.C.A. were inefficient," he continued, "it would mean that there were 1,122 men and women who were more or less of a failure. I do not believe anything like this number of people were unsuccessful." While Mr. Perkins found a number of instances of mistakes and bad judgment in the conduct of the Y.M.C.A. work, his general conclusion was that the organization deserved high praise for the manner in which it had accomplished a difficult task. A similar conclusion was reached by the War Department, and on several occasions Gen. Pershing expressed the opinion that the Y.M.C.A. had been unjustly blamed for circumstances over which it had no control.

Although with the return to the United States of the Expeditionary Forces the welfare work for the army and navy was taken over by the War and Navy Departments, at the request of the officers the Association was retained for service with the Army of Occupation in Germany. This work continued with a personnel of about 120, half being women. Huts were continued also for the navy and for the merchant marine in various foreign ports. Another outgrowth of the war work was the Soldier Scholarships. Under grants from the Association some 55,000 ex-service men continued their studies, in colleges, technical schools, or correspondence courses.

Service to prisoners continued throughout the war, and as late as 1921, when there were still Russian prisoners in Germany and Poland. Y.M.C.A. secretaries were with the Czechoslovak troops during their journey across Russia after their internment in Siberia. Association workers also met the thousands of German, Austrian and Hungarian prisoners when they at last reached eastern Siberia; and secretaries either went with them on the transports that finally bore them to their homes, or supplied motion picture outfits, paper, books and comforts for the men's use during the long voyage.

Perhaps the best comment on the war work of the Association is found in the requests from certain of the Allied Governments, whose officers saw the work in France, for its introduction into their armies. In answer to such demands the Association was organized in the armies of Poland, Czechoslovakia, Rumania, Greece and Portugal, and American workers remained with the *foyers* in France.

YPRES (*see* 28.941).—Pop. (1914) 17,497. The town, though never taken by the Germans, was systematically bombarded from Nov. 1914 to May 1915, and it remained a "salient" of the Allied armies throughout the World War. The terrific attacks to which the town was exposed during the war resulted in its almost entire obliteration. The famous Cloth Hall became a scarcely recognizable ruin; of the cathedral of St. Martin, only part of the eastern doorway remained intact, and most of the works of art in the church were destroyed.

YPRES AND THE YSER, BATTLES OF.—Under this heading, accounts are given of the main battles in this area of the Western Front: those of 1914, 1915, 1917 and 1918.

I.—BATTLES OF OCT. 12–NOV. 20 1914

General Situation.—The Belgian army, after its unsuccessful defence of Antwerp, had retired by way of Ghent and Bruges to the line of the Yser, between Dixmude and the sea, where it had established itself by Oct. 12. It consisted of six infantry and two cavalry divisions, in all about 48,000 rifles, with 300 guns; the 2nd, 1st and 4th Divs. in that order from the N. held the front from the coast as far as Dixmude, with two brigades of the 3rd Div. and the 2nd Cav. Div. in reserve behind. A brigade of the 3rd Div., a French Fusilier Marine Brigade, which had been sent up to the N. to assist the Belgian army, and the 5th Div. continued the line from Dixmude to Boesinghe, while the 1st Cav. Div. screened the whole front of the army. Farther to the S. the 87th and 89th French Territorial Divs. were coming into line E. of Ypres, on the left of the British IV. Corps (7th Div. and 3rd Cav. Div.) which was falling back from Ghent, where it had been posted to cover the right flank of the retiring Belgian army, by way of Thielt and Roulers to the S. and E. of Ypres.

To the right rear of the IV. Corps the remainder of the British army was advancing. The II. Corps, detrained at Abbeville, had pushed forward to the line of the Aire–Béthune canal, and was on the 12th advancing further to the line Givenchy–Merville, meeting with stubborn resistance from the German XIII. Corps. To the left front of the II. Corps the French I. and II. Cav. Corps and the British Cav. Corps were driving before them the German IV. Cav. Corps and had reached the area of Vermelles, and Estaires to the S. of the Lys and Merville, Merris, and Cassel to the N. of that river. Behind the British cavalry the III. Corps, detrained at St. Omer, had reached the region of Hazebrouck. The I. Corps was not yet up from the Aisne; in fact its leading units were only entraining on this day and its transport to Flanders was not to be completed till the 19th.

In face of these forces the right wing of the German VI. Army, under Prince Rupprecht of Bavaria, consisting of the XIII. and XIX. Corps, and covered on front and flank by the I., II. and IV. Cav. Corps, were moving into position on both sides of Lille, extending as far N. as the Lys, and beyond. To the N. of this army a new one was moving forward with the object of forcing back the Allied left and securing possession of the Channel ports. This Army, the IV., under the command of Duke Albrecht of Württemberg, consisted of the newly formed XXII., XXIII., XXVI. and XXVII. Reserve Corps together with the III. Reserve Corps, from Antwerp, and the 4th Ersatz Div. These new corps were detraining S. of Brussels on the 12th, covered by the III. Reserve Corps and the 4th Ersatz Div.

The Allied Plan.—On Oct. 4, when it became clear that the forthcoming operations in Artois and Flanders would of necessity be carried out not only by French but also by British and Belgian forces, Joffre had entrusted Foch with the coördination of the Allied contingents in the N. The French X. Army (Maud'huy), around Arras, thus came under Foch's command and formed his right wing, while to reinforce the British in the centre and the Belgians on the left, there was formed an "Army Detachment of Belgium" under d'Urbal, shortly to become the VIII. Army. The instructions given to d'Urbal were that he should assume the offensive as soon as possible from his detraining points in the general direction Roulers–Thorout–Ghistelles, while the British on his right advanced on Courtrai and Menin, and the Belgians on his left along the coast. It was hoped by these means to separate the enemy forces, which were following up the Belgians retiring from Antwerp, from the main body of the German army, and hem them in along the coast, and then to push forward against the right flank and rear of the German VI. Army S. of Lille.

Unfortunately it was found impossible in the event to carry out this far-reaching scheme. Not only was the Belgian army too weak and exhausted to be able to take part in an offensive without a breathing space for rest and refitment, but the first troops of the French VIII. Army only became available on Oct. 23; and by that time the situation had radically altered. It became evident that, so far from being in a position to drive back the enemy, the Allied forces were outnumbered and would do well if they could even hold their own. Consequently, although the idea of an Allied offensive was never entirely abandoned, the necessity for using the various formations as they arrived prevented it from being effectively put into execution.

The First Stages of the Battle of the Yser.—The detrainment of the German IV. Army was completed on the 13th, and its units, moving forward at once, had reached by the 17th the area Bruges–Thielt–E. of Courtrai. The III. Reserve Corps pushing eastward in front of the army, with its right along the coast and its left on Roulers, screened the advance of the newly arrived Reserve Corps. It was then ordered to clear the front by closing up on its right, which had on the 15th entered Ostend. On Oct. 16 it came into contact with the Belgian cavalry and forward posts E. of the Yser, and after two days of desultory fighting forced them to withdraw to their main position.

On the 18th the first encounters took place between the main bodies of the Belgian 2nd, 1st and 4th Divs., holding the Yser line from Dixmude to the sea, and the German III. Reserve Corps, which had been ordered to reach the neighbourhood of Furnes. The advancing Germans early came into contact with the Belgian outpost positions on the E. bank of the river on the line Lombartzyde–Mannekensveere–Schoor–Keyem. The northern part of this line held fast against repeated attacks but by nightfall the Germans had taken Schoor and Keyem; the latter however was recovered during the night. The attacks were renewed next day; the German XXII. Reserve Corps, coming into line to the S. of the III. Reserve, moved against the French and Belgian positions around Dixmude. Keyem and Beerst fell into its hands early in the day; Beerst was retaken about noon by the Belgian 5th Div. and the French Fusilier Marines, who were however forced to fall back in the evening to their former positions owing to the approach of further strong hostile forces (the XXIII. Reserve Corps) astride the railway from Thourout. On this flank the Allied units were now withdrawn behind the Yser, with the exception of the garrison of Dixmude. The preparatory fighting continued on the 20th on both flanks; the III. Reserve Corps, reinforced by the 4th Ersatz Div., attacked and carried Lombartzyde in the N. while to the S. a concentric attack of the XXII. and XXIII. Reserve Corps from three sides was repulsed with heavy loss by the Fusilier Marines holding Dixmude.

The German IV. Army was now completely deployed against the Yser line. The 4th Ersatz Div. in front of Nieuport, the III. Reserve Corps thence to Keyem, the XXII. Reserve Corps around Beerst and the XXIII. Reserve Corps E. and S.E. of Dixmude, in all seven divisions with over 400 guns, were aligned in face of the five Belgian divisions with their 350 guns. On the 21st, after a violent bombardment lasting throughout the night, the Germans advanced all along the line, their young troops fighting with the greatest courage but meeting with little success; and the French and Belgians, at the price of serious losses, held their ground at all points. In the night, however, the III. Reserve Corps succeeded in throwing a temporary bridge over the Yser, in the bend N. of Tervaete, and in passing over to the western bank infantry and machine-guns, while their artillery were brought close up to the stream to cover the advance of strong reinforcements. The 1st Belgian Div.'s counter-attacks failed to retrieve the situation; the Germans not only held their ground but extended it during the 23rd by seizing Tervaete itself to the S. The Belgian 3rd Div. was thrown into action from general reserve, without effecting more than the temporary checking of the hostile advance; during the day, the French 42nd Div., which had carried out a successful counter-attack on the 23rd to the E. of Nieuport, was placed at the disposal of the Belgian Higher Command and transferred near Tervaete, with the object of striking into the southern flank of the German troops who had crossed the Yser.

The French counter-offensive in the centre, supported as it was by all the available units of the Belgian 4th Div., though it failed to throw back over the river the two battalions of the III. Reserve Corps which held the Tervaete bridgehead, was successful in checking any further progress on their part. By the evening of the 24th indeed, both sides were showing signs of exhaustion. The efforts of the 4th Ersatz Div. before Nieuport and those of the XXII. Reserve Corps before Dixmude had met with no success; despite the powerful artillery fire from the heavy German artillery, which had reduced Dixmude to ruins, the Fusilier Marines still held the town, repulsing on the 24th 15 successive attacks. The Belgian army, however, had bought its success at the price of the severest losses; over 25% of its combatant strength had been placed *hors de combat*, and only 180 guns with only from 160 to 190 rounds apiece were left fit for service. The situation appeared to the Belgian Higher Command to demand extreme measures; it was doubtful if their troops could withstand another series of assaults such as those which had just been delivered, and on the 25th it was decided (it is said on the suggestion of Foch) to open the sluices of the Yser and inundate the country E. of the Nieuport–Dixmude railway. The sluices of Nieuport were opened at 4 P.M. on that day, under cover of darkness; the line of defence in the centre was withdrawn to the railway embankment, which it was intended to hold during the few days that must elapse before the slowly moving waters, fed by the successive tides, should engulf the country to the E. and form an impassable barrier.

Before recounting the last German assaults on the Yser front, we must return to the British sector, to the south.

First Stages of the Battle of Ypres.—The presence of the new German IV. Army in his front, and in particular the approach of the fresh Reserve Corps toward the gap at present open between himself and the Belgians, was at this date (the 15th) unsuspected by Field-Marshal Sir John French, whose attention and energies were concentrated on the offensive which he had arranged to carry out in conjunction with the Allied forces to his right and left in the direction of Courtrai and Menin. His instructions to his corps commanders were that the advance should be continued during the next few days on the whole front, the II. Corps on the right advancing due E., the III. Corps in touch with it securing the Lys crossings from Sailly to Armentières, and the cavalry passing over the river at Menin and advancing N.E., while Rawlinson with the IV. Corps on the extreme left moved on and to the N. of Courtrai. The last-named was warned to watch his left, beyond which hostile detachments were reported near Bruges and Roulers.

These operations, undertaken on the 15th and 16th, had hardly begun before it became evident that their continuance on the original lines was no longer warranted by the situation. The resistance met by the IV. Corps on the line Houthem–Gheluvelt–St. Julien–Westroosebeke convinced French that it was indispensable first to clear the hostile forces from the area N. of his left flank. Foch, however, on being asked to assist in this, could promise no more troops before the 22nd at the earliest, as his forces were still assembling. Accordingly, the IV. Corps was ordered to push on along to Menin on the 18th, the 3rd Cav. Div. screening its left, in conjunction with de Mitry's French Cav. Corps, which had come into line on the previous day W. of Houthulst forest. This task Rawlinson felt himself unable to carry out owing to the advance of strong hostile columns, consisting of the XXVI. and XXVII. Reserve Corps, against his left S. of Roulers, and by the evening of the 19th he had fallen back to the line Kruxiseik–Zonnebeke.

On the same day the concentration of the I. British Corps in the N. was completed in the area Poperinghe–St. Omer. French had now given up his ideas as to the possibilities of an Allied offensive and, realizing he was face to face with strong hostile forces which were being rapidly reinforced, began to fear for the weakness of his long and thinly held line, reserves for which were lacking. Although the II. and III. Corps were fighting against powerful positions and had been heavily taxed, French considered that the danger was greatest in the N., where the IV. Corps was holding altogether too extended a front, and that a break through there, while less fatal in its results than a similar disaster in the S., was inevitable unless reinforcements were sent at once. Accordingly the I. Corps was sent N. with orders to advance on Thourout with the object of capturing Bruges, if possible, before the enemy reinforcements, now believed to be in movement across Belgium, could be brought into line. French, however, was not too confident that this would prove feasible, and his instructions to Haig therefore envisaged not only the further prosecution of an eventual success toward Ghent, but also the possibility of the I. Corps having to go to the help of the IV., if the latter were heavily attacked.

Meanwhile the II. and III. Corps and the cavalry were ordered to confine themselves to the defensive, in view of the hostile superiority in their front.

The I. Corps only came into line to the S. of the IV. Corps on the 21st and by that date the advance of this latter toward Menin had, as we have related, come to an end; the 3rd Cav. Div. and de Mitry's horsemen to the N. had also been forced back, while the British Cav. Corps had retired to the Messines–Wytschaete line. To the S. Conneau's French cavalry were in line between the British II. and III. Corps.

It was only on Oct. 21 that the full extent of the menace to the British front burst on French, to use his own words, "like a veritable bolt from the blue." He at once realized that, in face of this overwhelming hostile superiority, all hope of a successful British offensive must be given up and indeed that he might have serious difficulty in maintaining his present positions. The British situation was certainly no easy one, for at the moment all available troops were in line, and the only reserves and reinforcements that seemed likely to be available for some weeks consisted of the Indian Corps, one division of which had just detrained W. of Hazebrouck, two Territorial battalions, and one cavalry and two yeomanry regiments.

Fortunately, French reserves were being hurried up from the S. The first of them, the IX. Corps, began to detrain in the Ypres area on the 23rd. During these three days from the 21st to the 23rd, when the British army was left to itself to withstand the shock of the enemy, it succeeded in holding its own without great difficulty. By the evening of the 21st the I. Corps had even commenced an advance, but the withdrawal of the French cavalry and Territorials on its left, which had been forced back by the advance-guard of the XXIII. Reserve Corps, compelled Haig to halt on the line Bixschoote–Langemarck–Zonnebeke. Here he held his ground against repeated attacks that night and all next day despite the wideness of his front; and, though the positions of the 1st Div. were broken into N.W. of Langemarck late on the 22nd, counter-attacks held up the German advance and finally on the 23rd recovered practically all the lost ground. Meanwhile the rest of the 1st Div. line held its positions against the attacks of the XXIII. Reserve Corps until the evening of the 23rd, when the 2nd Div. was relieved by the newly arrived troops of the French IX. Corps; 24 hours later the 1st Div.'s place was taken by French territorials.

The 7th Div. on the front Zandvoorde–Zonnebeke had also had heavy fighting to do from the 20th onward. The German XXVI. and XXVII. Corps, despite some success against the French on Rawlinson's left, which compelled him to retire that flank somewhat, were unable to make any impression on his front until the 24th, when units of the XXVII. Reserve Corps forced their way into Polygon wood and had to be ejected by the reserves of the 7th, assisted by units of the 2nd Division.

By this time the French Command considered that the time had come to undertake a general offensive. The French IX. Corps had just come into line and the XVI. Corps was on its way northwards. The British 2nd Div. was also available and was ordered to coöperate, as were also de Mitry's cavalry from Bixschoote and the French 42nd Div. along the coast from Nieuport. As a matter of fact the moment chosen was favourable from factors which the Allied leaders could not be aware of. The Germans were suffering from a local shortage of munitions; their new troops had suffered heavily, thanks to their enthusiasm untempered by training and experience and had everywhere been brought to a halt before the Allied lines. But the odds against the attack proved too great. The French IX. Corps and the 2nd Div. to its right made little progress on the 24th, despite their valiant efforts, and the offensive gradually petered out, not without taking heavy toll of the Germans, on the line N. and E. of Langemarck–W. of Poelkapelle, Passchendaele, and Moorslede. The 7th Div. on its front had only been able to hold its ground, and, in view of its weakness after three weeks of incessant marching and fighting, was on the 27th put under the I. Corps, together with the 3rd Cav. Div.; at the same time Haig's two other divisions were again put into line. The right of the 7th was now at Zandvoorde, that of the 1st on the Menin road, that of the 2nd just in Polygon wood.

To the S. of the I. Corps the 2nd Cav. Div. on the 20th held the front from Hollebeke to Messines; the 1st Cav. Div. extending thence to St. Yves; the 3rd Cav. Div. came into line later on the left of the 2nd and three Indian battalions were moved to Wulverghem in support. This part of the front, despite repeated attacks by the German XIX. Corps, remained intact till the 30th. On the right of the cavalry the II. and III. Corps also succeeded in maintaining their general line.

By the evening of the 27th the German IV. Army had been brought to a standstill on the whole front. "The XXVI. and XXVII. Reserve Corps were by this time" (Oct. 24), says the German official account, "completely held up in front of strongly entrenched positions on line Langemarck–Zonnebeke–Gheluvelt. . . . For the time being any further thought of a break-through was out of the question," and the decision which appeared at the moment to be "imminent" on the Belgian front near the coast had not yet been achieved. To assist the efforts of their comrades in this sector, and to cover the bringing up of further reinforcements to drive home the attack against the British line, the XXIII., XXVI. and XXVII. Reserve Corps were urged on to deliver holding attacks on their front. Despite their courage and persistence, the Germans, however, not only failed to make headway but were compelled in places to give back before the Allied counter blows; their only gain was registered at Kruiseik, which was wrested from the 7th Div. on the 28th after to and fro fighting. To the S. also the enemy pressed heavily against the front held by the British II. and III. Corps, assisted from the 23rd onward by a brigade of the Lahore Div. which relieved Conneau's Cav. Here the XIX. and VII. Corps made some headway and by the 29th had pressed the British front back to the line Givenchy–W. of Neuve Chapelle–S.E. of Armentières–Messines, where the Cavalry

Corps' right rested. The fighting was bitter and bloody, so much so that on the 28th the II. Corps, much reduced, had to be relieved by the Indian Corps, under Willcocks.

Meanwhile the French XVI. Corps, which had detrained its leading division on the 26th, was sent forward to reinforce the French IX. Corps S. of Houthulst forest, in order to participate in a new advance in the direction of Roulers. This attack, carried out on the 28th, failed to make much progress, and in the evening the French VIII. Army's line, which was held from N. to S. by the 4th Cav. Div., the 89th and 87th Territorial Divs., the 5th and 7th Cav. Divs., the 31st Div. (XVI. Corps), the IX. Corps, and the 6th Cav. Div., ran from the Yser just above Dixmude by the W. and S. edges of Houthulst forest—W. of Poelkapelle and Passchendaele—to Becelaere. To the left this line connected with the French Marine Fusiliers at Dixmude; to the right with the British I. Corps. Despite the slight progress made on the 28th, d'Urbal's orders were still for the continuance of the offensive.

Final Stages of the Battle on the Yser, Oct. 26–Nov. 4.—We left the Belgians and French on the evening of the 25th, re-forming their lines behind the embankment of the Nieuport–Dixmude railway, with orders to hold that line at all costs until the full effect of the inundation should make itself felt, and forbid any further German attacks. This could hardly be before the 31st, and meanwhile the III. and XXII. Reserve Corps were bringing up their artillery over the river, pushing forward patrols to occupy the ground up to the new Allied position, and making all preparations for a renewal of the attack. By the evening of the 29th these preparations were completed. Only one brigade of the 4th Ersatz Div. was left facing Nieuport, the Marine Div. being brought forward to fill its place; the rest of the Ersatz Div. thus became available for the decisive attack against the Belgian centre. At 6:30 A.M. on the 30th this assault took place under cover of a violent bombardment. The first rush carried the Germans up to within a few yards of the railway embankment; bombing their way forward they swept over it and, taking the defenders in enfilade, drove a wide gap in the Allied line from Ramscapelle to Pervyse, both of these villages falling into their hands. The Belgian 2nd Div. was broken through and the situation was critical in the extreme. A counter-attack by four French and Belgian battalions was immediately put in by Gen. Grosetti, commanding the French 42nd Div., and succeeded in holding up the enemy flood. A second counter-attack, delivered about 4 P.M., penetrated into Ramscapelle, where fighting continued to rage furiously all night. On the flanks of the attack the Allied line of defence had held fast, and the 4th Ersatz Div. and the XXII. Reserve Corps had been held up.

The crisis was past. The German intention was to renew the attack on the 31st, but at 11:30 P.M., as orders to this effect were being prepared, a staff officer from one of the divisions arrived at the headquarters of the III. Reserve Corps with the report that in view of the rise of the river the attack could not be continued. A belt of water 2,000–3,000 yd. wide and reaching as high as a man's waist covered the country behind the German front-line units and threatened to cut them off from their comrades unless they were hastily withdrawn. Accordingly, on the 31st the III. Reserve Corps was ordered back to the E. bank of the river, only weak rear parties being left to cover the movement. By 9 A.M. the Belgians were once more in possession of Ramscapelle and the railway embankment. Farther to the S. the positions held by the XXII. Corps on the W. bank of the river N. of Dixmude were also menaced by the rising tide of water, and the troops holding them were withdrawn on the night of Nov. 1. By the morning of the 2nd there were left of all the German gains on the left bank of the Yser only the villages of Schoorbakke and St. Georges and two farms N. of Dixmude.

On either flank of the Allied line where bridgeheads existed over the river, the first days of Nov. saw a series of small attacks with the object of improving the local positions. Such operations took place on Nov. 3 and 4 in the Nieuport sector, when Lombartzyde was occupied temporarily but lost again. A French attack also took place on the 3rd E. of Dixmude, and others on the 4th against St. Georges and Schoorbakke; but generally speaking, the Germans maintained their positions.

The battle of the Yser, strictly speaking, was over, and the plan of the German Higher Command, to seize the Channel ports and envelop the Allied left flank, had failed thanks to the heroic resistance of the French and Belgian troops. It was estimated that the battle had cost the Belgian army 18,000 casualties, the French some 5,000 (inclusive of the action at Dixmude on Nov. 10), and the Germans some 28,000.

Crisis of the Battle of Ypres, Oct. 29–Nov. 8.—In conjunction with the decisive attacks on the Yser line in the N., the German IV. Army was also preparing for a renewal of the assault on the Ypres front. A new army group was formed, under the command of von Fabeck, consisting of the Bavarian II. and the XV. Corps and the Bavarian 6th Reserve and 26th Div., with some heavy artillery from the VI. Army. This new group, assembling behind the junction of the IV. and VI. Armies, was to come into line on the 28th on the front Wervicq–Deulemont, in order to deliver a decisive attack also on the 30th. Both the German armies already in line were to coöperate.

Their preparatory attacks commenced on the 29th with extreme vigour. The Bavarian 6th Reserve Div., which had preceded the remaining troops of the new group into the battle-line, under cover of the early morning mist drove in the 1st and 7th Divs. at their point of junction E. of Gheluvelt. The reserves of the former division threw them back again out of all but the front trenches they had gained; the losses of the assailants were heavy. But this was only the prelude to the drama about to open. During the night of the 29th–30th the Fabeck group relieved part of the VI. Army Cav. in the line and went forward at 9 A.M. next morning. The XV. Corps on the right, moving with its right on the Menin–Ypres road and with its left on Zandvoorde, fell upon the 7th Div. and pushed them out of Zandvoorde after fierce fighting, but were then checked by the I. Corps reserves. On their left the Bavarian II. Corps advanced, and the French XVI. Corps and the British 3rd and 2nd Cav. Divs., after giving up some ground, made head against the enemy just E. of St. Eloi and Wytschaete. The 26th Inf. Div. failed however to dislodge the 1st Cav. Div. from Messines; a temporary success by the I. and II. Cav. Corps E. of Ploegsteert wood was retrieved by the 4th Div., and the XIX. Corps also failed to hold their gains at Bois Grenier, against the 6th Div.

The situation of the British, despite the fact that they had for the moment held their front intact, gave rise naturally to considerable anxiety at French's headquarters and the promise of Foch, who visited French at 2 A.M. on the next morning, to dispatch strong reinforcements to the I. Corps on the morrow, must have been very welcome. It was agreed that a French force of five battalions and three batteries under Moussy should be put in near Hollebeke, and another detachment at Becelaere; while the 32nd Div. would be sent to support the cavalry astride the Ypres–Comines canal. Before these forces could be brought up on the 31st, the enemy renewed his assaults. The 4th Div. in the S. was first attacked shortly after dawn; the action soon spread to the N., where the 26th Inf. Div. strove with the British Cav. Corps for the possession of Messines. The village was lost at 9 A.M., re-entered at 1 P.M., disputed hotly till dark and finally left in British hands. Farther to the N. the Bavarian 6th Reserve Div. vainly assailed the front of the 2nd and 3rd Cav. Divs., whose sector was taken over before long by the French XVI. Corps; but though the latter on their part delivered a series of counter-attacks, they were unable to achieve much.

The main crisis of the battle, however, was played out N. of the Ypres–Comines canal. Here the Bavarian II. and the XV. Corps had, as early as 10:30 A.M., forced back the 1st Div. front N. of the Menin road and followed this up by a strong attack along the road itself. Eight battalions employed against Gheluvelt quickly overmastered the two battalions in garrison there, and by 1:30 P.M. had seized the village and driven a gap in the British line. The situation was perilous in the extreme; the left of the 7th Div. was enveloped, and the right of the 1st Div. forced back in disorder down the Menin road. At the same time the commanders and some of the staff of the 1st and 2nd Divs. were knocked out by a shell which struck their headquarters; Haig prepared to retire to a line just in front of Ypres and hold on there at all costs.

But the Germans could not exploit their success; the Worcesters, in local reserve, thrown in at 2 P.M., checked the enemy's progress, and secured a position from which they could flank any further advance beyond Gheluvelt. The left of the XV. Corps had been held up by the 7th Div., assisted by the local reserves, and had been unable to exploit the exposure of its immediate enemy's flank caused by the loss of Gheluvelt. The Bavarian II. Corps indeed forced its way forward somewhat against the right of the 7th Div. and the 3rd Cav. Div., but its advance also eventually came to a stand, as had that of its comrades on the right and left of it. A gap which opened in the right wing of the 7th Div. late in the afternoon was opportunely filled by the arrival of the 7th Cav. Bde. which threw back the enemy.

It was clear that the enemy would not desist from his efforts, which had on the 31st brought him so near to success, but that further fierce attacks might be anticipated on the following days. The situation seemed therefore dark enough; the troops of the French VIII. Army, with which it had been intended to assume a large scale counter-offensive against both flanks of the enemy group attacking the British I. Corps, had had to be thrown in piecemeal to support various weak points in the line, and only one division, the 43rd, was left in general reserve W. of Ypres. Certain units even of this division had been sent into line before nightfall on the 31st in the vicinity of St. Eloi.

The fighting on Nov. 1, as was expected, was little if at all less severe than on the two preceding days. The main pressure, however, had shifted from the front of the British I. Corps over the Ypres–Comines canal to that of the cavalry corps. In the N. the enemy's efforts, which were not very vigorous, broke down before the readjusted lines of the 1st and 7th Divs., and the 3rd Cav. Div. The fighting, which had continued all through the night of the 31st–1st around Wytschaete and Messines, had already placed the cavalry corps in a difficult position, their line being broken at several points, and only partly reëstablished; however, the main German attack did not take place till noon, when the Bavarian 6th Reserve Div. and the 26th Div. advanced. Wytschaete, lost between 2 and 3 A.M. on the 31st, was still at this time in German hands, despite the efforts of reinforcements from the 3rd Div., sent up from the S. and from the 5th Cav. Bde. with French units of the 32nd and 43rd Divs., but the village was recovered about 6 P.M. and held firmly by the French. The loss of Wytschaete had been followed by that of Messines; the 1st Cav. Div. were drawn back to an entrenched line N. of Wulverghem, and later relieved by parts of the French XVI. and XX. Corps and of Conneau's cavalry. The situation, which had at one time seemed critical, was thus saved by the arrival of French and British reinforcements, and by the evening gave rise to less anxiety. The attack was continued next day by the Germans, who had put in a new division, the 3rd, on the left of the Bavarian 6th Reserve, and the fight swayed to and fro all day. By the evening Wytschaete and the crest of the ridge had been lost, but the French line was firmly settled on the rear slopes of the ridge to the west.

Gen. d'Urbal had not yet however abandoned all hope of a successful offensive, but the attempts of the French to advance on the 2nd and following days were neutralized by renewed efforts on the part of the enemy, and only in the Merckem–Bixschoote area was some slight progress made. On Nov. 5 d'Urbal received instructions from Joffre, which stated that the Flanders theatre of operations had lost some of its importance since neither Allied nor German attacks could hope to gain any further appreciable result, and that it was intended shortly to withdraw troops from the VIII. Army for use elsewhere.

Meanwhile the British dispositions had undergone some changes; the 7th Div. being relieved by two composite brigades from the II. Corps, and the French IX. Corps taking over part of the I. Corps front.

A renewed period of activity on the British front occurred in a few days, when these reliefs had been barely completed. On the 6th and 7th the 7th Cav. Bde. and units of the 7th and 1st Divs. recovered some ground lost by the French near Zwartelen; attacks on the 7th and 8th against the 3rd Div. E. of Herenthage wood and the 1st Div. and the French farther N. were also successfully dealt with. This was but the muttering before the bursting of the last storm.

The Germans, determined to make one last push for Ypres, formed on the 9th a new army group under von Linsingen, consisting of the XV. Corps and a composite corps, made up of the 4th Div. and a division of the Guard. This was put in on the left of the Fabeck group with orders to drive back and crush the enemy N. of the Ypres–Comines canal. The Fabeck group was to coöperate with infantry and artillery. This attack, timed for the 11th, was to be prefaced by an advance of the whole IV. Army on the previous day from Dixmude S. to Polygon wood. The southern part of this attack however did not get going.

The Final Battle, and the Stabilization of the Flanders Front, Nov. 8–20.—The attack on Dixmude was entrusted to the 4th Ersatz Div. and the XXII. Reserve Corps and took place on Nov. 10. The garrison of Belgian infantry and French Marine Fusiliers had been reinforced by French colonial troops and the Germans had to pay dearly for their success. The bombardment opened at dawn and the infantry attack at 7:40 A.M. It failed and was renewed after further artillery preparation at 9:30 A.M. By 1 P.M. the garrison had been driven from the eastern suburb and the town was assailed from N.E., E., and S.E. After desperate fighting, lasting till nightfall, the Germans succeeded in securing possession of the ruins of Dixmude. The garrison withdrew to the W. bank of the Yser and broke the bridges, but the enemy made only half-hearted attempts to follow them. They claimed to have taken in the town about 1,400 prisoners and much material. Further to the S., in the Bixschoote–Langemarck area, the German attacks made little headway. The British front was not attacked on the 10th.

Its turn was to come on the 11th, when the Fabeck and Linsingen groups attacked on the whole front from the Menin road to S. of Messines, about 9:30 in the morning, after two hours' bombardment. A thick mist veiled and assisted their advance. On the right of the assault the 12 battalions of the Guard struck against the line held by the weakened British 1st and 9th Bdes., and some French Zouaves. Their right broke past the S. side of Polygon wood, and swept the defenders out of Nonne Boschen, but their further progress was stayed on the western edge of this copse, and shortly after noon a counter-attack by the 2nd Oxon. and Bucks. L.I. forced them out of it again. The centre and left of the Guard, after some initial success in Inverness copse and Herenthage wood, were also held up and compelled to abandon most of their guns. Further S. also little progress had rewarded the Germans' efforts. The XV. Corps had to content itself with the capture of Hill 60; the Bavarian II. Corps gained some success N. of Wytschaete; elsewhere the attackers had been kept to their trenches.

This day's fighting was the closing act of the Ypres battle. Both sides were entirely exhausted by close on a month of sustained and bitter fighting, which had thinned their ranks, drained their supply of munitions, and left them no available reserves which could be employed in further effort. On Nov. 15 General d'Urbal came to the decision to suspend further offensive activity, consolidate his position and allow his troops a period for rest and refitment. Joffre, however, felt that the operations on the Flanders front had reached their fitting termination with the repulse of the enemy's last desperate effort to bring about a decision in the open field, and accordingly instructed d'Urbal to hold himself henceforward on the defensive.

The Germans on their side had also come to an end of their resources. On the 17th the German IV. Army commander, after the failure of a final effort by the 4th Div. in Herenthage wood, "decided to give up any idea of continuing the offensive—a decision to which he was compelled by the low fighting strength of his troops and the bad autumn weather which was affecting their health; . . . . the German General Staff fully concurred in the decision."

Meanwhile on the 21st the British were withdrawn from the Ypres salient. French troops took over the front line; the I. Corps and Cavalry Corps remained in reserve; the two brigades of the II. Corps which had been sent up to the N. were also moved back to rest.

The battle of Flanders was at an end, and the armies, their front stabilized along all the line from the sea to Switzerland, settled down with the approach of winter to trench warfare.

(X.)

II. Battles N. of the Lys, 1915

The five weeks' pause in active operations which had followed the battle of Neuve Chapelle was due mainly to the necessity of accumulating ammunition, of which the supply was still far from adequate, but also to the need of timing the next attack to coincide with General Foch's great attack against the Germans N. of Arras. Meanwhile a minor operation carried out by the II. Corps S.E. of Ypres led to extremely fierce local fighting. Where the Ypres–Comines railway cuts through one of the southern spurs of the Broodseinde ridge there is a mound which was of considerable tactical value especially as an artillery observation post. On April 17 1915 this "Hill 60" was successfully stormed by the 2nd K.O.S.B. and 1st Royal West Kents of the 5th Div., but its capture provoked prolonged and vigorous counter-attacks. The hill was lost and retaken more than once and not only the whole of the 13th Bde. but the 1st Devons and 1st E. Surreys of the 14th Bde. and the 2nd Camerons of the 27th Div. had to be thrown into the fight. By the end of a week the Germans had apparently acquiesced in the loss of the position for their counter-attacks died away.

But the struggle for Hill 60 was soon to be eclipsed. During April the British had gradually relieved the French in the Ypres salient. First the 27th Div. took over the line from Zwartelen to Polygon Wood, then the 28th came in on the left to and beyond the Broodseinde cross-roads, by April 17 the Canadian Div., now allotted to the V. Corps, occupied the N.E. face of the salient as far as the Ypres–Poelkapelle road. Thence to the Ypres–Yser canal were French troops, chiefly Africans. It was against this last section that on April 22 the Germans delivered the first gas attack. Some suspicions of this new weapon seem to have reached the Allied Headquarters, but there had been no time for preventive measures, and to the unfortunate Africans the gas-clouds came as a complete surprise. Luckily for the Allies the efficacy of their new weapon surprised the Germans themselves: they hastened to fall upon the Canadians whose left flank the rout of the French had completely exposed, but they had not enough troops to exploit their success.

The Canadians stood the strain of their first serious engagement splendidly. Their front line maintained their positions unshaken; a line was hastily improvised along the Poelkapelle road toward St. Julien to cover the exposed flank and rear of the front line, while local reserves manned the second-line trenches near "Shell Trap Farm" N. of Wieltje in time to check the further advance of the Germans. Divisional and corps reserves were hurried up at once and that evening a counter-attack by the 10th and 16th Batts. temporarily recovered a wood W. of St. Julien. But the position was critical in the extreme. Between "Shell Trap Farm" and the canal a 2-m. gap lay open, Ypres itself was dangerously exposed and all the troops in the salient might have been cut off by a rapid German advance in force. Moreover, during the night of April 22–23 the Germans succeeded in capturing the bridge at Steenstraate over the Yser canal and established themselves on the western bank.

The first need was therefore to close the gap between the Canadians and the French right. But conditions were all against counter-attacks. There was little time for reconnoitring or for coördinating advances, there was hardly any heavy artillery to support them for over 50 French guns had fallen into the enemy's hands. In the course of April 23 attacks were made by a detachment drawn from the reserves of the 28th Div. by the Canadian 1st and 4th Batts. and by the 13th Bde. (5th Div.) hastily fetched up from the rest camp where it was recuperating after its heavy fighting for Hill 60. These attacks did not dislodge the Germans from the position they had already dug and wired along the ridge running westward past Pilckem, but they prevented further advance and by the evening a continuous line had been established from the canal to St. Julien. Elsewhere the position remained unchanged; though heavily shelled and under reverse and enfilade fire the Canadians stuck stubbornly both to their original trenches and to the new flank thrown back to cover St. Julien, and more than one German advance was beaten off.

But with the Germans on the Pilckem ridge their guns could not only enfilade all the roads leading eastward into the "Salient" but could fire into the backs of the troops S. and E. of Ypres whose situation was therefore rendered most unsatisfactory. However, encouraged by promises of large French reinforcements, Sir John French endeavoured to maintain his original position until the French could reëstablish theirs. He had brought up a brigade of the 4th Div. and the newly arrived Northumbrian Territorial Div. (later numbered 50th), while in the course of April 24 the Lahore Div. reached Ouderdom. But before a systematic counter-attack could be launched a successful German attack on the Canadians had changed the position for the worse. On the morning of April 24 an extremely heavy bombardment developed on the original Canadian trenches, followed by the discharge of gas and by infantry attacks in force. The troops N. of St. Julien were overwhelmed and in the course of the morning the Germans, pressing on, made themselves masters of St. Julien and drove its defenders back upon Fortuin. Between Fortuin and the trenches of the Canadian 2nd Bde., which still held out, there was for a time an open gap, but the German efforts to advance were checked by artillery fire at short range and before dark the gap was filled mainly by units of the 28th Div. to whose position, around Broodseinde, the German attacks had now extended though without success. But St. Julien was gone and the next counter-attack had to make the recovery of St. Julien its objective.

This, delivered early on April 25 by the 10th Bde. and various attached units, advanced the line a little, but failed to recover the village. With equal gallantry and equally heavy casualties the Lahore Div. and the French attempted on April 26 to regain the Pilckem ridge, but just as success seemed within reach gas drove the French back and the advanced troops of the Lahore Div., overcome by this new weapon, could not maintain the positions they had reached. The Northumberland Fusilier (T.F.) Bde. attacked St. Julien with the same ill-fortune and meanwhile the Germans had managed despite the stubborn resistance of the Canadian 2nd Bde. to capture most of the Gravenstafel ridge. The 28th Div.'s left, N. of Broodseinde, was thus seriously exposed while simultaneously its infantry attacked it in front, but the arrival of the 11th Bde. (4th Div.) enabled some sort of line to be established across the N. of "the Salient." Still it was only with great difficulty and heavy losses from shell-fire, that the newly arrived units managed to dig themselves in and establish touch with each other. Luckily the German infantry attacks lacked vigour and determination and afforded the defenders welcome opportunities for retaliation.

By the evening of April 26th, however, the situation had not improved. A second attempt by the Lahore Div. (April 27), though gallantly pressed, achieved nothing; the French had made no progress and with the Pilckem ridge firmly held by the Germans the advanced position of the V. Corps was clearly untenable. Accordingly Sir John French decided upon a withdrawal to a new line running N. of St. Jean, N.E. of Wieltje, by Frezenberg, E. of Hooge, through the woods S. of the Ypres–Menin road to join the original line of the V. Corps N. of Hill 60. This line was much less liable to reverse and enfilade fire, but the evacuation of the Broodseinde ridge and Polygon wood meant losing valuable positions only to be recaptured at a heavy cost in the autumn of 1917. The move

was, however, postponed to allow the French and the Lahore Div. one more attempt upon the Pilckem ridge but this also achieved nothing substantial and was followed by renewed German attacks and desperate fighting. On May 1 an attempt upon Hill 60 in which gas was effectively used was only just beaten off by the gallantry and steadiness of the 1st Dorsets. Next day a violent attack was launched against the northern face of the salient from St. Julien to the canal, bearing hardest upon the 12th Bde., who suffered terribly from the gas. Prompt counter-attacks by the local reserves, including dismounted troopers of the 3rd Cav. Bde., restored the situation and drove the Germans back with heavy losses while elsewhere the line was successfully maintained. The actual withdrawal, begun on the night of May 2–3 and completed on May 4, was covered by a stubborn defence of the left of 28th Div.'s line N. of Broodseinde by the 2nd Buffs and the 3rd Royal Fusiliers, thanks to which the final stages of the retirement were unmolested by the Germans, who did not indeed discover what was happening until too late to interfere. Their one substantial success was the recovery of Hill 60, recaptured on May 5 by a renewed gas attack.

The evacuation of the advanced position of the V. Corps may be taken as ending the first stage of the battle. Fighting continued, however, for another three weeks during which the Germans delivered three major attacks, on May 8, May 13 and May 24. The first of these broke through the 28th Div. near Frezenberg and resulted despite several counter-attacks in the loss of most of that division's front line, though on its left the 4th Div., which had replaced the Canadians, maintained its position. Between May 8 and May 13 there was particularly bitter fighting round Hooge where the 27th Div. was posted astride the Menin road. After repeated attacks the Germans contrived to make a few lodgments in the line, but their advances in mass formation had given good targets and they lost heavily, more than one local counter-attack meeting with success. South of the road against the 81st Bde. they gained nothing substantial, though N. of it the front trenches had to be evacuated in favour of a line just W. of the Bellewarde wood. The attack of May 13 extended from Hooge to the left of the British line. The exhausted infantry of the 28th Div. had now been relieved by the 1st and 2nd Cav. Divs. acting as infantry on whom fell the brunt of the exceedingly heavy bombardment. This was followed up by infantry attacks which had little difficulty in occupying positions which had been almost obliterated. Counter-attacks by the 7th and 8th Cav. Bdes. (1st and 2nd Life Guards, Royal Horse Guards, 10th Hussars and Essex and Leicester Yeomanry) reached the front line only to be forced back again by the violence of the bombardment, and the day resulted in the establishment of a new line some distance in rear of the original position, while the hamlet of Valorenhoek passed into German keeping and the left of the troops in the Bellewarde position had to be flung back to connect up with the cavalry's new line. On the other flank, however, in front of Wieltje the 4th Div. held firm and inflicted heavy losses on the enemy, retaking such portions of the line as the Germans had temporarily captured.

After May 13 ten days of intermittent heavy shelling and occasional sharp local fighting followed, during which the French recovered Streenstraate and thrust the Germans back across the canal. But the Germans had not finished. Early on May 24 a tremendous bombardment opened upon the whole front from the Menin road, northward. Gas was discharged in great quantities and at certain places, notably Hooge, "Shell Trap Farm" and the Bellewarde ridge, the defenders were completely overcome by the fumes. The Germans therefore had only to advance against positions practically denuded of defenders. Counter-attacks were launched, but without much success beyond preventing the Germans from penetrating deeper than the front line, while just S. of Hooge the determined resistance of the 1st Cav. Div. checked the extension of the German success. During the night of May 24–25 some units of the 27th and 28th Divs., hastily recalled from rest camps where they were seeking to assimilate the large drafts with which they had just been replenished, were put in to try another counter-attack. This, however, failed to recover Hooge or the Bellewarde ridge, and similarly, though the 4th Div. maintained most of its front, its centre had to be retired to a new line through Wieltje.

This fighting, however, marked the last serious German effort on this front. With all the advantages of surprise derived from their use of gas, they had not succeeded in taking Ypres and if they had made substantial gains of ground and had inflicted heavy casualties on the defenders their own losses whenever they had ventured on an infantry advance had been heavy. When viewed as a whole the defence of the Ypres salient during April and May 1915 stands out as a splendid achievement. Many battalions were in the front trenches for three weeks and more on end, without any relief, constantly shelled, subjected to repeated attacks, at a fearful disadvantage in having to face gas-attacks with only the most inadequate and improvised protection. Ground was lost, but the main position was held and the II. Army's tenacious resistance supplies a good example of "economy of forces." When the German attack on Ypres was launched the Allied offensive further S. was about to be resumed. The II. Army was asked to maintain its ground without depending upon the men and munitions needed elsewhere. Only one division of the I. Army was employed in the defence of Ypres and it was not because of any diversion of resources to the Ypres area that the British offensive of May 1915 proved a bitter disappointment.

(C. T. A.)

III. BATTLES OF 1917

Continuous fighting of a violent character took place in the Ypres-Yser region during many weeks in the summer and autumn of 1917, but the operations as a whole may be said to have consisted of two distinct phases. The undertaking started with the brilliantly successful combat lasting only a few hours which has come to be known as the Battle of Messines. There followed a period of comparative lull, although progress was made at some points and although counter-attacks had to be beaten off. Then there were launched immediately to the N. of the scene of the Messines combat a series of attacks at short intervals which gained ground as successive waves do on a rising tide and which lasted for more than four months.

The object in view throughout was the occupation of the whole of the belt of high ground which extends from a point about three miles directly N. of Armentières to near Dixmude, beyond the forest of Houthulst. Its general direction is at first north-eastward to about Gheluvelt, then it turns northward to near Staden, and from that point it veers back westward toward the Yser, N. of the above-named forest. A continuation of somewhat more conspicuous high ground lying N. of Hazebrouck and Bailleul, this belt represents the watershed between the basins of the Lys and of the Yser. It rises generally some 100 to 150 ft. above the great Flanders plain, and it reaches a height of over 200 feet at a few points. Its southern portion in the spring of 1917 inclosed to a great extent the Ypres salient and had been the scene of many desperate encounters during the Ypres-Yser battles of 1914 and 1915; here the Allies' trenches gave them possession of some of the lower slopes on their side of the high ground, although all the upper portion was in German hands. Further to the N. the enemy held the whole of the high ground as well as stretches of plain to the W. of it, as from opposite Gheluvelt the direction of the Allies' front ran north-westward, *i.e.* diverging from the line of heights. The general plan of operations was to begin at the southern end, where the belt of high ground was almost contiguous with the British front, and to work from thence northward. This procedure was indeed almost dictated by the fact that the Ypres salient would have to be extended outward ere full use could be made in later undertakings of the important communications which diverge from Ypres itself toward Bruges and Ghent and Oudenarde. The capture of the line of high ground—its total length was about 23 m.—only represented the first part of the general strategical plan, which contemplated the initiating of subsequent operations in the coast district by another force.

The line which the Allies had been holding to the N. of Armentières since the spring of 1915 formed in plan an inverted letter "S," the lower loop turned to the W., the upper loop turned to the E. and creating the Ypres salient. The lower loop on the other hand represented a pronounced enemy salient jutting into the territory in occupation of the Allies and causing them great inconvenience. Its area consisted almost entirely of high ground which had come to be known as the Messines–Wytschaete ridge. From this dominating position the Germans effectively enfiladed, and to some extent took in reverse, the Allies' trenches to the S. and to the N. of the salient and also commanded the communications leading up to these from the rear, while they overlooked the town of Ypres from within easy field-gun range. Quite apart from any projects for an offensive on a great scale, the filling in of this enemy salient—the wresting of the Messines–Wytschaete ridge out of hostile hands—was bound to ameliorate the situation in Flanders from the point of view of the Entente and to render the task of barring the invader's way toward the Channel ports so much the easier. In framing his plans for the Flanders offensive Sir D. Haig had already decided to make the high ground about Messines and Wytschaete his first objective months before the date when the attack upon the position, formidable by nature and rendered infinitely more formidable by the labour that had been expended upon it, actually took place.

General Plumer and his II. Army, who had been acting as the wardens of the Ypres front for more than two years, had been selected to carry this operation out. To enable the II. Army to bring its full force to bear, the V. Army under General Gough had been transferred from the positions which it had been occupying between the III. and IV. Armies in Artois during 1916, to the Ypres salient and it was thus on the left of the II. Preparations for the undertaking had been afoot since the previous summer but they had only been carried on in earnest during the preceding winter. Moreover all the necessary labour and material had not been available until the prior demands of the Arras scheme of offensive operations had been satisfied, and very strenuous work had consequently to be carried on up to the last moment so as to insure that all would be ready. The preparations included an elaborate railway scheme. Much road construction was an indispensable part of the plan. Special provision for securing an ample water supply had been made. A great force of artillery had been quietly assembled. But the most noteworthy item of all, owing to its virtual novelty, was the carrying into effect of arrangements for a deep mining offensive on a colossal scale. Twenty great mines had been established at the end of galleries running right under the enemy's front line of defence, but one of them had been blown up by the Germans; a total length of 8,000 yards of gallery had, in spite of very active countermining on the part of the enemy, been driven by the tunnelling companies of miners since Jan., and 600 tons of explosives had been distributed between the 19 mines that were effective. The simultaneous explosion of these mines at the moment when the assault was launched was the most remarkable feature in a battle, the exceptionally decisive issue of which was primarily to be attributed to the labour that had been expended in advance, and to the care and forethought of commander and staff which had preceded the opening of the combat. It should be mentioned that the preparations above ground had been carried out under special difficulties owing to most of this area being overlooked from the German lines.

For the defence of this salient which they occupied, and the importance of which they fully realized, the Germans depended upon two separate sets of lines, coinciding in trace with its arc. The more advanced set of lines of the two was close to the trenches that were occupied by General Plumer's troops, and it was at most points pushed down the forward slope of the high ground. The second set of lines on the other hand, which formed an inner curve, followed the crest of the Messines–Wytschaete ridge along most of its extent. The villages of Messines and Wytschaete had been organized as main centres of resistance capable of offering a stout defence, and many farms, hamlets and copses existing along the line had been utilized to form defensive posts. The Germans had moreover also constructed two chord positions stretching along the base of the salient partly on and partly below the reverse slopes of the high ground. The front one of these two positions represented the final objective given to the assaulting columns by General Plumer.

The troops of the II. Army detailed for the enterprise consisted, enumerating them from right to left, of the II. Anzac Corps under Lt.-Gen. Sir A. Godley (Australian 3rd Div., New Zealand Div., 25th Div.), with the Australian 4th Div. in support; the IX. Corps under Lt.-Gen. Hamilton-Gordon (36th Div., 16th Div., 19th Div.), with the 11th Div. in support; and the X. Corps under Lt.-Gen. Sir T. Morland (41st Div., 47th Div., 23rd Div.), with the 24th Div. in support. There were thus nine divisions in front line and three in support. As the final objective of the troops along the whole battle-front was the chord of the arc forming the salient, it followed that the divisions in the centre would have a greater distance to cover than the divisions on the flanks; this had been taken into account and had been provided for in the time-table. The moment of assault was fixed for 3:10 A.M. on the morning of June 7, and at that hour the 19 mines were exploded beneath the enemy's front line with devastating effect. At a number of points the hostile trenches were completely obliterated and their garrisons wiped out, so that when the assailants reached the enemy's front line under cover of a tremendous bombardment, very little resistance was offered and the first objective was secured almost at once. The consequence was that, as had been anticipated in the programme, the advancing infantry could proceed without delay to the execution of their next task, that of carrying the second German line. The capture of this proved more difficult than had that of the front defences. In some of the skilfully prepared localities the enemy detachments would not yield for some time, in spite of the storm of shell pouring down upon them; but such localities speedily became isolated as the assailants pushed on between them, and their fall was not then long delayed. The strongly fortified village of Messines was, according to the programme, taken by the New Zealanders. Wytschaete was captured after a determined struggle by portions of the 36th (Ulster) and of the 16th (Irish) Divs. fighting side by side. On the left, where a trough which is followed by the Ypres–Comines canal cuts through the belt of high ground, the 47th (London) Div. had very formidable obstacles to overcome but pressed steadily forward and took many prisoners. The movements of the attacking side had been somewhat hampered at the outset by the dim light and by the air being dust-laden owing to the great explosions; but as the morning wore on this impediment to advance disappeared. An interesting feature in the opening phase of the battle had been that the tanks told off to assist the advancing battalions had in many cases been unable to get up in time to share in the struggles for the German second line of defence, so rapid had been the movements of the infantry. The operations had proceeded in almost exact accordance with the time-table, and by early in the forenoon all the upper part of the Messines–Wytschaete ridge and of its extension north-eastward to the limit of the battlefield was in the hands of British and Australasian troops. These moreover had consolidated the ground that they had won, and they were holding a line which, along most of its extent, was on the reverse slope of the high ground and overlooked the German chord lines of trenches; guns had also been pushed forward promptly to assist at closer range the advance which was to be made against these as the final operations of the day.

This closing effort took place in the afternoon and it was completely successful, although the enemy showed some disposition to counter-attack and at some points offered a stubborn resistance. So it came about that by the evening the last objective had been fully attained, and that General Plumer and his army had placed an extraordinarily complete and decisive tactical success to their credit. The extent of the success was not to be measured merely by the importance and extent of the area of ground which had been wrested out of the enemy's hands by masterly soldiership. Great captures in men and material had also been effected. 7,200 prisoners (including 145 officers) had been taken, together with 67 guns, 94 trench mortars and 294 machine-guns. Nor had the victory been purchased at a heavy cost in casualties. The total number of killed and wounded—the latter in many cases representing trifling injuries—only amounted to 16,000 in an army of sixteen divisions assailing a position of exceptional strength and that was strongly held. That the defenders realized how thoroughly vanquished they were, was shown by the feeble nature of such counter-attacks as were attempted during the day, as well as by the fact that the conquerors were during the night permitted to consolidate the ground that they had secured, almost unmolested. The battle of Messines was from the point of view of the victors a veritable masterpiece of design and of execution.

Not until the evening of the following day, the 8th, did the Germans adventure a general counter-attack upon the positions which the II. Army had won and which it had by that time prepared satisfactorily for defence. Covered by an intense bombardment, the hostile infantry then advanced to the assault along practically the whole of the new front; but they were beaten off at all points. The enemy drew back somewhat from in front of the southern portion of the ground conquered by the II. Army during the next few days, and on the evening of the 14th General Plumer's troops carried their line forward some distance on either flank. Their front thenceforward for some weeks ran almost in a straight line from where it quitted the line held on June 6, opposite the village of Frelinghien at the southern end, to Observatory ridge, situated a mile E. of Zillebeke, where it joined the line held on the earlier date. This represented a length of about nine miles. In depth, the ground wrested from the Germans opposite the centre of the old enemy salient was nearly three miles.

Some very important re-arrangements in the general distribution of the Allied forces N. of the Lys were being carried into effect about the date of the battle of Messines and during the immediately following weeks, in preparation for the Flanders offensive that was to follow. The actual composition of the different British armies also underwent considerable change. Portions of the old IV. Army were moved N. from Artois, under command of Sir H. Rawlinson, to the extreme left of the Allies' line about Nieuport on the coast; this comparatively small IV. Army was to be expanded at a later date and was to play an important part in the operations, should the earlier stages prove as successful as was hoped. On its right were placed the Belgian forces. On the right of these again, and linking them up with General Gough's British V. Army, was brought in the French I. Army under command of General Antoine, which was to act under the orders of Sir D. Haig. Its right was a little N. of Boesinghe, where it was in contact with the Guards Div. which formed Gough's left; the V. Army front extended from thence to near the Ypres–Comines canal where it joined up with the left of the II. Army.

A pause of some weeks in active operations now took place in Flanders, the time being devoted on the side of the Allies to making the elaborate preparations that were necessary before the contemplated offensive could be launched. The lull was however interrupted by an unfortunate incident on the extreme left of the line. In the coast region, the front between Dixmude and the shore followed a line in rear of the Yser river and canal except quite close to the sea. There it crossed over the enemy's side of the waterway, thereby creating a somewhat isolated patch of territory, occupied by troops whose communications with the rear and with their reserves were dependent upon a few floating bridges. This patch consisted near the sea of sand-dunes which from their nature were particularly difficult to entrench. It had been taken over as it stood by the British 1st and 32nd Divs. of the IV. Army and the 1st Div. was on the left next the sea. Perplexed by the arrival of British troops on the coast and anticipating serious developments in this quarter, the Germans determined to strike a blow against the extremely vulnerable sector of the Allies' front lying on the right bank of the Yser, and they delivered their attack on July 10. The front of the 1st Div. beyond the river was on that day occupied by the 1st Northamptons and the 2nd K.R.R.C. battalions which had been brigaded together since quitting Aldershot in July 1914. Early in the morning the isolated sector was subjected to an intense bombardment by a great number of guns which had been especially concentrated for the purpose. The bridges in rear were destroyed by shell. Dugouts and shelters were flattened out, and the difficulties of the two battalions were much aggravated by the explosions choking their machine-guns and rifles with sand. When the hostile infantry advanced to the attack the small British force was overwhelmed, only a few small parties eventually escaping by swimming the river. But although the enemy by this stroke gained possession of the left of the isolated sector, their effort against its right portion, held by the 32nd Div., failed. No evil result followed to the Allies, apart from the disaster to the Northamptons and Rifles.

Although the capture of the Messines–Wytschaete ridge and of most of the high ground on either side of Ypres–Comines canal gap had put an end to the enemy overlooking Ypres from the S., and tended to limit hostile observation of the place from the S.E., the Germans still dominated it, in a measure, from the E., from the N.E. and from the N. This circumstance exercised a very important influence over the arrangements that were being carried out for the offensive about to be undertaken, the first stage of which was to be directed in the main against the invader's defences sited on the high ground lying in a quadrant round the ruined town.

"The various problems inseparable from the mounting of a great offensive," writes Sir D. Haig in his despatch of Dec. 25 1917, "the improvement and construction of roads and railways, the provision of an adequate water supply and of accommodation for troops, the formations of dumps, the digging of dugouts, subways and trenches, and the assembling and registering of guns, had all to be met and overcome in the new theatre of battle under conditions of more than ordinary disadvantage. On no previous occasion, not excepting the attack on the Messines–Wytschaete ridge, had the whole of the ground from which we had to attack been so completely exposed to the enemy's observation. . . . Nothing existed at Ypres to correspond with the vast caves and cellars which proved of such value in the days prior to the Arras battle, and the provision of shelter for troops presented a very serious problem. The work of the Tunnelling Companies of the Royal Engineers deserves special mention in this connexion. It was carried on under great difficulties, both from the unreliable nature of the ground and from hostile artillery, which paid particular attention to all indications of mining activity on our part."

Preparations for the offensive could not in fact be concealed. The forces with which it was proposed to break out from Ypres and to gain possession of the high ground to the E., further out to the N.E., and still further out to the N., were assembled openly during the latter part of the month of July. The Germans were perfectly well aware that they were going to be subjected to a very formidable attack in this region.

The portions of the coming battle-field that lay nearest to Ypres had already been the scene of fierce combats, which have been dealt with in Parts I. and II. of this article. But certain points in connexion with their topography call for some reference, while the arrangements which the Germans had made for defence must also be described. The little river Steenbeke (or Jansbeke as it is called in its lowest reaches) joining the Yser near Merckem, creates together with its tributary streams, nearly all of which join it on the right bank, a feature that proved of considerable tactical importance during the prolonged operations that followed. The main stream and also the watercourses joining it flow northwestward or westward from their sources on the crest of the high ground between the Ypres–Menin road and the village of Passchendaele, with gentle spurs jutting out between them. The most extensive of these spurs is that between the valley of the Steenbeke itself and the low-lying flats of the Yser immediately N. of Ypres, which had come to be known as the Pilckem ridge; it was from this spur that the town was overlooked from the N. But the general direction of streams and spurs alike being that they run from S.E. to N.W., it followed that an offensive directed north-eastward had to cross them successively and that they tended to provide the defenders with a succession of minor positions. Seeing also that, from about the point where the V. Army was in contact with the II. Army, the main ridge ran in a generally northerly direction, while the front occupied by the V. Army before the attack was launched ran from S.E. to N.W., General Gough's forces which were to carry the operation out, with the French I. Army coöperating on their left, necessarily pivoted on their right and in throwing their left forward were confronted by this succession of minor positions. The shallow depressions representing the valleys of the Steenbeke and its affluents tended to be marshy and to flood and become almost impassable in wet weather.

Anticipating that the Allies would embark on a great offensive in this quarter sooner or later, and becoming aware during the spring that such an offensive was actually in preparation, the Germans had taken steps to meet the eventuality with characteristic thoroughness and ingenuity. Experiences on the Somme, on the Ancre and at Arras, as well as on battle-fronts in Champagne where they had been attacked by the French, had taught them that a continuous system of trenches did not proffer an altogether satisfactory form of defence against the terrific bombardments which the Allies could bring to bear, unless abundant underground cover could be provided; and the nature of the soil in Flanders, with water always near the surface, militated against the creation of subterranean galleries. A continuous line in any case offered a favourable target for guns and was objectionable on that account. They were therefore holding the ground over which attack was expected by a system of numerous disconnected trenches and strong points which were arranged in depth rather than in breadth and which permitted of the forward defences being held by relatively small forces, with the idea of gradually absorbing attack rather than of giving no ground at all. Scattered about were small concrete blockhouses with walls of great thickness which could not be harmed by shell of less than about 6-in. calibre, and which contained garrisons of about twenty men each, with two or three machine-guns; the British soldiers when they came to make acquaintance with them called them "pill-boxes." A defensive system designed after this fashion was more difficult to map by aerial photography than were continuous lines, and a preliminary bombardment directed against it was in consequence necessarily so much the less effective. As their front line near Ypres had been in existence since 1915 and as much labour had been expended upon it the Germans were, however, trusting to the old system to meet the first shock in the event of attack. It was rather in the later offensive operations that the Allies found themselves confronted with the new devices.

The front which Sir D. Haig had decided to extend his initial advance along stretched from opposite Deulemont on the right, to beyond Steenstraat on the left—a distance of over 15 miles. But the most important blow was to be delivered by the V. Army in the middle on a front of approximately 7½ m. between the Zillebeke–Zandvoorde road and the village of Boesinghe (inclusive) on the left. The task of the II. Army to the S. was limited to that of increasing the area threatened, so as to occupy the enemy's attention, only a trifling advance being intended. The French I. Army on the British left was to push forward its right in close touch with the left of the V. Army, with the primary object of securing this against counter-attack from the N. The start of the offensive had originally been fixed for July 25. It was however postponed for various reasons until the 31st. Owing to the enemy having retired out of his foremost trenches along the northern portion of the V. Army front, British and French troops on the 27th crossed the Yser canal (which had hitherto formed an awkward obstacle at this point) about Boesinghe; this enabled bridges to be thrown and it greatly facilitated the attack in the left sector when this took place four days later.

The order of battle of the V. Army (II., XIX., XVIII. and XIV. Corps), enumerating the divisions from right to left, was as follows:—24th, 30th, 8th, 15th, 55th, 39th, 51st, 38th and Guards Div., with two divisions to each corps in support. The French 1st Div. was next to the Guards beyond Boesinghe. Starting at 3:50 A.M. on the 31st, the Allied infantry generally experienced little resistance at first and only began to meet with serious loss when advancing towards their second objectives. This was particularly the case on the right, where the 24th and 30th Divs. were endeavouring to gain possession of all the commanding ground about and beyond Shrewsbury forest and Sanctuary wood to the S. of the Menin road; they failed to push forward more than a few hundred yards. But further to the left the assailants were successful at almost all points, reaching the line of the Steenbeke and capturing St. Julien. The French stormed Bixschoote, which was beyond the furthest objective given them. Even if the check to Gough's right discounted the completeness of the victory, the third battle of Ypres had opened most encouragingly for the Allies. The Pilckem ridge had been wrested from the enemy so that the town of Ypres was no longer overlooked by hostile forces to the N. and N.E., the front had been pushed forward along its full extent, and over 6,100 prisoners (including 135 officers) and 25 guns had been taken by the British alone.

But the weather had broken. July had up till the 31st been an almost consistently fine month, but that morning opened threatening, and rain came on during the course of the day. It fell steadily all that night and continued without cessation for four days, while for several days following the weather remained unsettled. The low-lying clayey soil, pitted with shell-holes, became a succession of muddy pools. The valleys became almost impassable except at a few points. The delay that ensued gave the German troops time to recover from their defeat of the 31st and also to bring up reinforcements before there could be any question of continuing the offensive; it was not indeed until Aug. 16 that improving weather had sufficiently dried the ground to justify the launching of a fresh general attack. This was again undertaken by the V. Army and by portions of the French I. Army on its left, the Menin road marking about the southern limit of the offensive operations. The four corps of the V. Army (II., XIX., XVIII. and XIV.) were disposed in line in the same order as on the opening day, but on this occasion the divisions in front line were in most cases those that had been in support before. The advance was timed for 4:45 A.M., and the operations were quite successful on the left, but the result on the right was even more disappointing than it had been on the 31st and on this occasion comparative failure extended further along the line toward the left. Except for some trifling local gains of ground the II. and XIX. Corps improved their position very little, suffering repulse at most points; nor was the resistance of the enemy purely of the passive kind, for the Germans delivered some determined counter-attacks, and as a result of several hours of fluctuating fighting the troops in front line in the right half of Gough's Army lost heavily. The XVIII. Corps on the other hand did much better, its left division indeed gaining all its objectives, while the XIV. Corps, still further to the left, was entirely successful. Langemarck was taken, the Steenbeke passed along a front of two or three miles, and a large gap made in the German third line of defence. The French advanced their line all along their front and occupied Drie Drachten on the extreme left, on the borders of the inundation area. Still, if the Allies were entitled, upon the whole, to claim victory in view of what had been accomplished along the left half of the battle-front and of their having secured 2,000 prisoners and 30 guns, their arms had met with reverse in the other half. Nor was there reason to suppose that the enemy losses had been more severe than those of the assailants.

The Flanders offensive, unavoidably started late, had now been in full swing for more than a fortnight, and little improvement in the position had been effected in what represented the really vital sector of the front—the ground about the crest of the ridge stretching away from the uplands won at the battle of Messines toward Passchendaele. Up there the line had only been advanced a few hundred yards as a result of two regularly prepared attacks. Unless progress could be expedited at this critical point, there was little prospect of achieving the object for which the offensive had been undertaken. It was clear that a fresh force was needed to deal with the enemy in this portion of the sphere of operations, and the British commander-in-chief therefore decided to extend the left of the II. Army northward and to entrust the attacks against the higher ground to General Plumer, who was to work in conjunction with the V. Army farther to the left. Experiences gained on July 31 and Aug. 16 had moreover shown that new methods of attack were called for. The enemy's elastic system of defence—forward trenches weakly held while formidable reserves were kept in hand to counter-attack before assailants could consolidate such ground as they had won—suggested limitation in the depth of objectives, and it called for special artillery concentrations to deal with the hostile counter-strokes when they were delivered. The requisite measures took some time to carry out and the weather moreover continued unfavourable during the latter part of Aug., rendering the ground so waterlogged that a long interval became necessary to permit of its drying to some extent. In Flanders it may be remarked, as in England, humidity of the atmosphere increases rapidly from about the middle of Aug. onward, so that periods of fine weather have less and less effect in absorbing the moisture of the ground as the season advances. The first half of Sept. however, proved bright and dry and the date of the next attack was fixed for the 20th of that month.

The plan of operations for this day was that the II. Army (consisting from right to left of the 19th, 39th, 41st, 23rd, Australian 1st and 2nd Divs.) was to push forward between the Ypres–Comines canal and a point a few hundreds yards S. of the Ypres–Roulers railway, while the V. Army (consisting from right to left of the 9th, 55th, 58th, 51st and 20th Divs.) was to press forward on its left to as far N. as the Ypres–Staden railway. At no point was it proposed to gain more than a mile of ground in depth, and, except about the Ypres–Menin road and immediately to the N. of this, the furthest objectives given to the various divisions were not more than half a mile in advance of the existing line. The weather unfortunately broke during the night of the 19th–20th; but in spite of this the attacks achieved their object all along the front and the efforts of the II. Army were crowned with brilliant success in a sector where previous attempts had to a great extent failed, the crest of the main ridge on either side of the Ypres–Menin road being wrested from the enemy. The V. Army likewise appreciably improved its position. The losses of the attacking side on this day were relatively small, in view of the importance of what had been achieved, and 3,243 prisoners and several guns were taken.

Sir D. Haig followed up the success of the 20th without delay. A fresh thrust took place along a more restricted length of front on the 26th, from about half a mile S. of the Menin road to a point about a mile and a half N. of the Ypres–Roulers railway. The forces detailed for the enterprise, enumerating them from right to left, were the 39th, 33rd, Australian 5th and 4th Divs. of the II. Army, and the 3rd, 59th and 58th Divs. of the V. Army. The Germans had in the meantime been making desperate attempts to recover some of the ground which they had lost about the Menin road and Polygon wood, but without success; and in spite of their resolute opposition they were unable to prevent the British troops from attaining practically the whole of their objectives on the 26th. The rest of Polygon wood was captured, the British position was improved all along the line, and 1,600 prisoners were taken. That the losses should have been by no means heavy on this day as on the 20th showed how effective an answer the method of the shallow objective provided to the enemy's new plan of defence by depth. The combats of Sept. 20 and 26 having given almost the entire crest of the main ridge into British hands to a depth of a mile and a half in advance of the line taken up on July 31, Sir D. Haig arranged for a very important operation to take place on Oct. 4, the front this time extending from Polygon wood to the Ypres–Staden railway, although a minor advance was also to take place S. of Polygon wood and S. of the Menin road.

There was a severe gale accompanied by torrents of rain during the night of the 3rd, and the weather conditions on the following morning were so unfavourable that the ground was in most parts of the battle-field little better than a morass. The enemy moreover was in great strength, especially in the centre; two fresh divisions had been brought up into the German line and, as it happened, these together with the troops already on the spot were drawn up ready to deliver an assault which was timed to start ten minutes later than the hour that had been fixed for the British advance. The consequence was that when the British artillery barrage opened it caught hostile forces that were gathered in mass and it did great execution. The order of battle of the II. and V. Armies was as follows:—37th Div. of the IX. Corps on the extreme right, athwart the Menin road, then the X. Corps (5th, 21st, 7th Divs.) covering the front up to in front of Polygon wood, then the I. Anzac Corps (1st and 2nd Australian Divs.) reaching as far as the Ypres–Roulers railway, and, on their left again and forming the left of the II. Army, the II. Anzac Corps (Australian 3rd Div. and New Zealand Div.); the V. Army was represented by the XVIII. Corps (48th and 11th Divs.) next to the II. Anzac Corps, with the XIV. Corps (4th and 29th Divs.) on the extreme left. The attacking side gained a signal victory this day. Nearly all its objectives were secured, and the gains were especially important in the centre where a firm footing was won along the main ridge about the villages of Molenaarelsthoek and Broodesinde for a length of a mile and a half; a gentle spur stretching back north-westward from this and known as the Gravenstafel ridge was also wholly secured. A hold was gained further to the left on the important village of Poelkapelle on the Ypres–Roulers road; and along all the central part of the zone of operations the assailants pushed their line forward several hundred yards, thereby taking possession of ground of great tactical importance. 5,200 prisoners were taken, including 138 officers, and, besides a few guns, a large number of machine-guns and trench mortars were amongst the day's captures. Following as it did rapidly upon the successes of Sept. 20 and 26, the combat of Oct. 4 represented a highly satisfactory achievement, which had moreover been accomplished without very heavy sacrifice. It was not indeed the losses encountered in these well-defined actions that gave grounds for anxiety so much as the casualties which occurred day after day to troops that were clinging to exposed positions, where owing to the condition of the ground it was almost impossible to create effective cover.

A good defensive line had however now been secured. As a result of the offensive operations begun by General Plumer on June 7 and continued intermittently for four months, the crest of the long belt of high ground had been occupied from Messines to within a very few hundred yards of the Ypres–Roulers railway and the situation of the Allies in Flanders had been vastly improved in consequence. Possession of the Gravenstafel ridge would moreover enable Sir D. Haig to establish a strong flanking position, which would render it difficult for the Germans to recover the high ground they had lost by a turning movement from the N. But, regarding the Allied offensive in this part of the theatre of war as a whole, the work was in reality only begun. The Houthulst forest, with the long line of high ground forming the quadrant of a circle beyond it, was still in the enemy's hands. Until the ridge had been secured as far as the vicinity of Staden, it would be premature to embark on the second part of the general scheme of operations—attack on the German positions along the coast between Nieuport and Ostend. Sir D. Haig had now to decide whether he should continue his system of gradual advance N.E. of Ypres, or should call a halt.

"The year was far spent," he writes in his despatch. "The weather had been consistently unpropitious, and the state of the ground, in consequence of rain and shelling combined, made movement inconceivably difficult. The resultant delays had given the enemy time to bring up reinforcements and to organize his defence after each defeat. Even so, it was still the difficulty of movement far more than hostile resistance which continued to limit our progress, and which now made it doubtful whether the capture of the remainder of the ridge before winter finally set in was possible. On the other hand there was no reason to anticipate an abnormally wet October. The enemy had suffered severely, as was evidenced by the number of prisoners in our hands, by the costly failure of his repeated counter-attacks, and by the symptoms of confusion and discouragement in his ranks. . . . After weighing these considerations, as well as the general situation and various other factors affecting the problem, among them the desirability of assisting our Allies in the operations to be carried out by them on Oct. 23 in the neighbourhood of Malmaison, I decided to continue the offensive further and to renew the advance at the earliest possible moment consistent with adequate preparation."

That the British commander-in-chief in arriving at this decision was largely governed by considerations to which expression could not appropriately be given in a despatch sent in so early as Dec. 25 1917, there can be little doubt. However favourable Oct. weather might be, the whole of the ridge together with the Houthulst forest was most unlikely to fall into the Allies' hands before the winter set in. The persistent rains had had too great an effect upon the soil for this to recover from it before the spring, even if the rest of the autumn were to be dry and favourable. For the offensive plan, as originally conceived, to be carried out in its entirety even in an ordinary season, Sir D. Haig's forces ought to have attained the positions which they had only secured by Oct. 4, at least two months earlier. But he was aware that the fighting capacity of the French armies was for the moment diminished by grave internal troubles, the Russian collapse had set free large hostile forces which were being rapidly transferred to the western front, and if the British offensive ceased, the enemy would regain the initiative and would be free to assail the French front wherever this happened to be weakest. It followed that the British, in spite of the difficulties in the way, must continue their offensive until the coming of winter put an end for the time being to the danger of a German counter-attack.

The hopes which had been entertained at G.H.Q. that Oct. might bring dry weather after the heavy rains experienced in Aug. and Sept., were doomed to disappointment. The days immediately following the combat of Oct. 4 proved worse than ever, and the troops suffered great hardships besides losing many men from hostile shell-fire owing to the lack of protection; they had to trust for shelter to shallow trenches hastily scooped out to join together adjacent shell-holes. The enemy however had been so roughly handled on the 4th that any counter-attacks which were attempted from the hostile lines had little force in them. In spite of the unfavourable climatic conditions a fresh attack was arranged for Oct. 9, the front on this occasion extending from about the Ypres–Roulers railway to the extreme left near Merckem. The order of battle of the II. and V. Armies was as follows:—Anzac I. Corps (Australian I.), Anzac II. Corps (66th and 49th Divs.), representing the II. Army; XVIII. Corps (46th, 48th and 11th Divs.), XIV. Corps (4th, 29th and Guards Divs.), representing the V. Army. On the left of these again was the French I. Army. The night of the 8th was particularly dark, there was heavy rain, and considerable trouble was met with in mustering the troops for the assault so that this was carried out under conditions of extraordinary difficulty. The advance was on this day, in accordance with the programme, pushed farthest forward on the left and about the left centre. The outskirts of the Houthulst forest were gained by the French in spite of much of the low-lying ground being actually under water, and the British troops on their right made good the ground to a depth of a mile and a half about Langemarck. On the right the assailants were strongly opposed and lost heavily, but they nevertheless gained their objectives along most of their front. 2,100 prisoners in all were taken, with a few guns, and the day's operations could be reckoned as representing a substantial success, if at heavy cost.

A fresh advance was attempted on Oct. 12 in spite of a continuance of the bad weather and of the ground being in a terrible state. It should be mentioned that in all this later fighting forming part of the great Flanders offensive, the Allied infantry were seriously handicapped by lack of heavy gun support. In such a sea of mud the larger types of howitzer could not be got forward, and in spite of bold and skilful handling the field artillery did not provide an effective substitute. With the Germans it was different. Their heavy ordnance when it was required to move was generally traversing ground that had not been torn up by months of shell-fire and where roads were still in being. The front of attack covered on the 12th was approximately the same as that covered on the 9th and the objectives given to the various divisions only called for an advance of a comparatively short distance; but many of the lower valleys were found to be absolutely impassable owing to the floods, and the operation eventually was not persisted in at most points. 1,000 prisoners were taken, but the attacking side lost heavily, and, although the unsatisfactory result of the effort from the British point of view was attributable to the elements rather than to the enemy, this day's fighting amounted to an undoubted reverse to the cause of the Allies.

All hope of making any appreciable gains of ground except in one particular sector was now abandoned by G.H.Q., although the front was slightly pushed forward in the region of the Houthulst forest by dint of some skilfully carried out minor operations during the next few days. The one sector where it was determined to continue the offensive was the ground between the Ypres–Roulers railway and the neighbourhood of Poelkapelle. The II. Army was in possession of the crest of the ridge about Broodseinde and where the railway traverses this; but further to the left the line ran diagonally across the rearward slope of the heights and was commanded from these at short range. Having once pushed forward beyond the front that had been taken up as a result of the successful combat of Oct. 4, it had become almost imperative to secure possession of the village of Passchendaele as well as some rising ground immediately to the N. and N.W. of that place, and to arrange that the line should run back in a westerly direction from this point, at right angles to, and not diagonally across, the ridge. This would create a sharp salient; but Passchendaele was a commanding point, and the lie of the ground between it and Poelkapelle would favour the establishment of a strong defensive line for the winter. Sir D. Haig therefore decided to continue the offensive immediately to the N. of the Ypres–Roulers railway on a narrow front, and in order to give this a fresh impetus he brought the Canadian Corps round from Lens. A number of readjustments of the order of battle of the II. and V. Armies also took place, for some of the troops about Ypres were required for the offensive secretly prepared in the Cambrai region.

The weather after Oct. 12 showed distinct signs of improvement, although at this late season of the year there could be no hope of the saturated soil recovering very appreciably from the effects of those abnormal autumn rains which had proved the most formidable antagonist of the Allies in Belgian Flanders. But the signs proved delusive, for on the 25th, the very day before a fresh attack had been arranged, heavy rain set in again. This operation only covered the front between the Ypres–Roulers railway and Poelkapelle, the main advance being intended to take place in the right centre and right. The troops detailed for the undertaking were, enumerating them from right to left, the Australian 1st Div., the Canadian 4th and 3rd Divs., the 63rd Div., and part of the 58th Div. But what amounted to an independent operation (except in that it must occupy the enemy's attention on a part of the front only about 2 m. from the main attack) was also undertaken on this day by the 5th and 7th Divs. on either side of the Ypres–Menin road. In spite of unfavourable weather and the deplorable state of the ground important progress was made by the Australian and Canadian troops, the latter getting up close to Passchendaele and successfully withstanding heavy counter-attacks in most portions of the ground which they had won. The 63rd and 58th Divs. also reached their objectives, but they were not called upon to push the line forward more than a short distance, their task rather being to link up the ground won by the Canadians with the old line near Poelkapelle. Some hundreds of prisoners were taken. The operation further to the S., on the other hand, which only had a very limited objective, was unsuccessful. The purpose had been to capture the village of Gheluvelt and to improve the position somewhat a little further to the N.; the possession of Gheluvelt on its well-defined spur running south-eastward would create as it were a bastion to flank the forward slopes on either hand. But after very nearly gaining their objectives at the outset, both the 7th and the 5th Divs. were driven back to their starting point, and they suffered heavily in casualties during a furious combat. With the ground in the condition that it was in, rifles were apt to become choked with mud, while percussion shell buried themselves in the swamp doing little harm by their explosion; these conditions however affected both sides equally.

Between the 26th and the 28th Belgian and French troops made an important gain of ground on the extreme left of the line, securing possession of the flats as far forward as the Blankaart lake. And on the 30th a fresh attack was made between the Ypres–Roulers railway and Poelkapelle by the same troops as had fought on the 26th, but on a narrower front this day as most of the high ground in the direction of Passchendaele which Sir D. Haig was anxious to occupy had been captured in the previous combat. Some progress was made; but the Germans offered a very stout resistance at important points, although at others they showed some symptoms of losing heart and some of them even abandoned their posts at the outbreak of the fight. Owing to the front of attack now being restricted and to the object which the assailants had in mind being obvious, the enemy was concentrating a very heavy artillery fire upon the area that formed the battle-field, and in their efforts to get to Passchendaele the Canadians suffered heavy losses on this day. The 63rd and 58th Divs., further to the left and attempting to get forward on lower ground, found this almost impassable and they only advanced their line slightly here and there. But up on the main ridge what had been achieved paved the way for a brilliant success a week later. At dawn on Nov. 6 the Canadian 2nd and 1st Divs. suddenly advanced and captured Passchendaele together with the somewhat higher ground immediately to the N. and N.W. of the village, also taking 400 prisoners. This fine achievement can fairly be set down as the closing incident in what has been called "The Third Battle of Ypres." One or two attempts were made within the next few days to improve the position in the sector where the Canadians had made such substantial gains, and these were partially successful, but they did not appreciably modify the situation.

The prolonged succession of combats, many of them (such as the capture of the Messines–Wytschaete ridge by the II. Army and the very successful operations on July 31 and Oct. 4) reckoning as unqualified victories to the credit of the Allies, had transformed the situation in Flanders. The chain of heights from N. of Armentières to Passchendaele had changed hands. The Ypres salient, vastly extended, so far from its constituting a weak and barely defensible sector of the Allies' front, had become a serious danger to the enemy. Sir D. Haig had secured an excellent defensive position between the Yser and the Lys. Great hostile forces had been kept fettered to the north-western extremity of the western front, striving to maintain possession of a tract that had been captured by the invaders some three years before. But the main object for which the offensive had been undertaken had been only very partially attained. The German hold upon the coast district remained unshaken. The line of high ground to the N. of Passchendaele and circling round beyond the further outskirts of the Houthulst forest, as also that forest itself, remained in the enemy's hands. The third battle of Ypres, chiefly perhaps because of unfortunate delays in starting the operations and of untoward weather conditions after they had been started, had not prepared the way as had been intended for subsequent advance upon Ostend and the great plains N. of the Lys. (C. E. C.)

IV. Battles of September 1918

At the end of Aug. 1918, when the French counter-offensive, commenced on July 18, and the British counter-offensive, begun on Aug. 8th, had both been crowned with success, the initiative in strategy had been definitely taken out of the hands of the German command. The enemy had been driven from the salients of Château-Thierry and Montdidier, which were his conquests of March and May.

Thanks to British shipping, each month 250,000 American soldiers were being landed on French soil, and this increasing wave of troops, young and fresh, gave the Allies a superiority in numbers and *matériel* which grew day by day.

Desiring that the enemy should have no opportunity to recover from disorganization and fatigue, Marshal Foch proposed to continue the operations by a triple attack, to which end three actions were to commence about Sept. 25 at 24-hour intervals.

The American I. Army and the French IV. Army were to attack on both sides of the Argonne in the general direction of Mézières. The British I., III. and IV. Armies and the French I. Army were to push towards Cambrai and St. Quentin, and break through the famous Siegfried position or Hindenburg line. The Belgian army, the British II. Army and certain French divisions, who would presently join them, formed the group of the armies in Flanders under the supreme command of H.M. the King of the Belgians, and would undertake the operations in Flanders. This force in the first place was to secure the Flanders ridge and having conquered this to push on the left wing toward Bruges–Ghent with the object of freeing the Belgian coast, while the right wing would push toward Courtrai–Renaix in such a manner as to cause the evacuation without fighting of that vast inhabited region Lille–Roubaix–Tourcoing.

At the request of King Albert, General Degoutte of the French army took over the duties of chief-of-staff of the group of armies in Flanders.

The German Position.—The Belgian army and the British II. Army were ordered to seize the Flanders heights, the line which, starting from Hill 10 toward the S.E. of Dixmude, reaches Hill 43 at Clercken, passes round the forest of Houthulst by the Stadenberg, passes by Westroosebeke, Passchendaele, Zonnebeke, beyond Ypres to Gheluvelt, Hill 60, Wytschaete and Messines. The line continues to the right toward the W. by Mont Kemmel, Mont Rouge, Mont Noir and Mont des Cats, which form the watershed of the rivers Yser and Lys.

At this period nine German divisions held the sector Dixmude–Armentières: three or four being at rest behind the front line. The first line of German trenches passed by Dixmude, Woumen, the Chateau Blanckaert, Langemarck, St. Julien, Zillebeke, St. Eloi, Wytschaete, Messines, and the river Lys to the W. of Armentières. This was a zone of cover behind which the Germans had echeloned four successive positions, the product of four years of stability which had been strengthened with particular care in 1917 to resist the British offensive that year.

These were characterized by the use of concrete groups, very numerous and strong, of the type of the famous "pill-boxes" of Stirling Castle, Inverness Copse and Poelkapelle. Some of these contained sections of artillery with gunners and ammunition: generally they sheltered one or two sections of machine-guns, the fire of which covered the intervals and afforded flanking fire to each other. Everywhere were vast stretches of a network of barbed wire in front of dugouts and trenches affording an entire continuity of obstacles.

The terrain of the attacks had been entirely overturned by the bombardments in the British offensives of 1917: every vestige of cover had disappeared; only some mounds of walls marked the position of villages; the soil was riddled by the shell-holes adjoining each other; the land drainage system no longer functioned, every ditch was full of water and the field of battle everywhere was a vast and foetid bog (slough) in which progress was arduous. The network of roads was hidden under the mud and any advance would be as difficult for the lines of skirmishers as for the artillery horse-teams and the supply convoys.

The German artillery had the advantage of the commanding positions. Their observation posts on the ridges enabled them to fight effectively over the entire country of the attack. Again, in the centre of the sector assigned to the Belgian offensive stands the forest of Houthulst, a renowned strong-point, and a bastion for artillery which dominated with its fire a great part of the Belgian and British fronts. As Marlborough had said:—"Whoever is Master of the Forest of Houthulst is Master of Flanders."

Plan of Attack.—About Sept. 15 the Belgian army, 12 divs. of infantry and one of cavalry, held a front of 35 km. from the sea at Nieuport-Bains to the northern outskirts of Ypres.

The British II. Army, 10 divs. of infantry (General Plumer), occupied the sector Ypres–Armentières, about 20 km. in length.

The *moral* of the two armies was excellent: the British troops aspiring to seize from the enemy the fruits of their successes in the spring; the Belgians seeing the day at length dawn, which they had so anxiously awaited, when they should leave the lines on the Yser and hasten to the deliverance of their country.

King Albert, commander-in-chief of the group, decided that the first operation should have as its object the conquest of the following objectives. For the Belgian army: Dixmude, Clercken, Stadenberg, Passchendaele, Broodseinde. For the British army: Molenaershoek, Polygon wood, Hill 60. From these points the armies would advance eventually to the attack on subsequent objectives. The Belgian army placed 11 divisions in the line, of which one was a French division; the British army employed six divisions. On the extreme left, two Belgian divisions remained in their sector on the front Nieuport–Dixmude. They were to hold themselves in readiness to push forward on the first order and clean up the left bank of the Yser in the inundated area, and to take the opportunity to release the flood-water. On the extreme right, the British divisions which were furthest S. were to watch for any indication of weakness in the enemy in order to follow up and hasten his retreat. Two divisions of French infantry which were now arriving, and the division of Belgian cavalry, constituted the general reserve.

The Belgian 4th Div. crossing the Yser immediately to the S. of Dixmude was to secure the ruins of the village and seize the former line N. of Dixmude and Zarren and the length of the canal of Houdzaeme. The British 14th Div. formed the flank-guard at St. Eloi. The frontage of the principal attack was—Clercken–Gheluvelt—a little over 20 km. in length, so that the frontage of attack of each division of the first line was about 2 kilometres. The British 9th and 29th Divs. placed two brigades in the first line and one brigade in the second line; the 35th Div. had all three brigades in the first line. All the Belgian divisions uniformly adopted the *carrée* formation: all of their three regiments were together; in each regiment the battalion in the first line pushed straight ahead, the battalion in the second line advanced taking special care to reduce any strong points of resistance and clearing up any such positions overrun by the first line: the battalion in the third line, held as long as possible in reserve, was employed to pass eventually the first line and thus to undertake the continuation of the advance. In this formation the Belgian army had 24 regiments in the front line placed side by side in three lines of battalions. This offensive disposition is noteworthy. Taking everything into consideration, there is no other example in the whole war of the deployment of an army which shows more audacity, more determination, which promised a greater promptitude in employing all units, and greater rapidity in opening up the battle.

The Belgian army, united to a strong contingent of French and British artillery, formed a mass of artillery of 1,550 guns, of which 280 were trench guns and 500 heavy artillery. The British II. Army had about 1,000 pieces, of which half were heavy. Therefore on the actual frontage of the attack Dixmude–St. Eloi (about 25 km.) the Allies possessed some 1,800 guns both heavy and field, independently of trench artillery. The greater part of the Belgian batteries had been placed E. of the Yser canal at Ypres; a certain number held a position to the E. of Martjevaart and also in the peninsula of Luyghem, only those batteries of very long range and insufficiently mobile remained on the W. bank of the canal.

The attack was to be preceded by a violent preparatory bombardment of one duration of three hours. The movement of the artillery during the advance was made the subject of special orders, and it was arranged that in each division of the first line a group of 7·5 would be allotted to accompany it and distributed at the strength of one battery for each regiment of infantry.

Action of Sept. 28.—All the preparations for the attack had been carried out with the greatest secrecy. Artillery action had been very feeble for many days. Batteries and ammunition had been pushed forward and installed in the first lines under cover of careful camouflage; divisions had been concentrated in the sectors of attack and had been deployed for the battle entirely by night marches. On Sept. 28 at 02:00 (morning) the 17 divisions were in their battle positions; a vast body of men ready to march against the enemy with enthusiasm and in perfect order. At 02:30 hours there commenced on the whole front of the two armies a powerful bombardment of preparation which was to last for three hours. At 05:30 hours the infantry left their advance positions preceded by a creeping barrage.

The rain almost at once commenced to fall heavily, making every movement yet more laborious. Overcoming every obstacle they encountered, the Belgians secured in one magnificent sweep the Francken, Preussen and Bayern Stellung.

At 07:30 the last obstacle was passed, except for the northern group, and the field artillery proceeded on their way to accompany immediately the subsequent attacks. The enemy only feebly counter-attacked. The northern group had at the outset encountered a stubborn resistance at the Château Blanckaert which the defenders held to the death, as well as an adjoining farm. These strong-points were not secured until about midday. Beyond the Bayern Stellung the Germans counter-attacked and put up a vigorous defence.

In the northern group the centre of the attack was the conquest of the forest of Houthulst, filled with obstacles and ambushes, and in addition the burnt trunks of trees and torn branches—the result of four years of bombardment—proved an impenetrable entanglement where advance was only possible along the straight drives set at right angles, and these were barred by wire and enfiladed by machine-guns.

On the left, while the Belgian 4th Div. seized Rille and St Pieters, the Belgian 1st Div. secured the Château Blanckaert, Hoog Kwartier, while with a gallant rush the 22nd Regt., having conquered at the point of the bayonet many batteries which the gunners fired until the last moment, arrived at the crossroads of Houthulst at 11:00 hours and occupied it.

On the right, the Belgian 7th Div. drove right through the forest and arrived at the end of the day on the eastern boundary, having conquered it entirely with many dozen of cannon and important material.

In the centre group the Belgian 3rd Div. reached without difficulty the heights by the station of Poelkapelle, where they held up some violent counter-attacks which debouched from the S.E. corner of the forest; these attacks were strongly thrown back as far as Schaap-Ballie, which the division occupied at the same time as the 9th Div. arrived at the outskirts of Westroosebeke.

In the southern group the 6th and 12th Divs., held up by the terrible condition of the ground, reached halfway to the crest-line Westroosebeke–Passchendaele and found the enemy occupying in force this strong position. Further bombardments by the artillery and many assaults left the situation unchanged. Toward the end of the afternoon a strong German counter-attack forced itself into line after line of the 6th Div. However, the 8th Div., which had seized Broodseinde, advanced on Moorslede and at 20:00 hours the 4th Carabineers took Passchendaele by assault. To summarize, the nine Belgian divisions of infantry which had been engaged, accomplished under heavy rain an advance of about 8 km. across the most appalling country bristling with every defensive accessory and abundantly furnished with machine-guns; they had conquered the famous bastion of the forest of Houthulst and captured over 4,000 prisoners besides considerable material.

As for the British II. and XIX. Army Corps, they had reached all their objectives: Becelaere by the 9th Div., Krviseecke by the 29th Div., Zandvoorde by the 35th Div. Thus on the first day over the whole frontage of the Belgo-British attack there had been greatly exceeded the extreme limits of the victories of the third battle of Ypres (July–Nov. 1917)—that battle of giants wherein 51 divisions of British and 78 divisions of the Germans had disputed the same country foot by foot for four months with a vigour unknown in history.

Action of Sept. 29.—It was of importance that this brilliant success should be followed up with the greatest vigour. The following day the battle recommenced at 06:00 hours after artillery preparation of half an hour. It was intended to force the *Flandern II. Stellung.* In the northern group, after the 1st Div. had secured Clercken and Ternst, the 10th Div. conquered Ruvter Hoeck and Zarren. At 09:00 hours the 4th Div. had taken Woumen and Eessen and proceeded to encircle Dixmude. Toward noon the division proceeded to clear up the town. With the central group, the battle was particularly vigorous: the 3rd Div. occupied in the first place Vyewege and in the afternoon made an assault on Stadenberg, which was secured at 16:45 hours after an obstinate fight.

The 9th Div. threw six attacks against Westroosebeke without gaining a foothold.

In the southern group the 8th Div., followed by the 11th Div. and fighting side by side with the British 9th Div., prepared to attack Moorslede when the latter division was carrying Keiberg. About 13:00 hours the 8th Div. found itself 500 metres W. of Moorslede. The attack was made at 14:00 and secured the position after a severe fight, and completely forcing the enemy line, advanced the 7th Regt. toward St. Pieter, on the road Menin–Roulers, which was occupied at nightfall. On the left, the 12th Div. was taking the woods of Kalve and Calliemolenhoeck; to the right the British 9th Div. secured Keiberg and penetrated into Danizeele. During the day's action four fresh German divisions were encountered.

Action of Sept. 30.—On Sept. 30 the 3rd Div. occupied Staden; the Belgian 9th Div. entered the evacuated Westroosebeke and occupied the outskirts of Oostnieuwkerke.

The other divisions undertook by certain local engagements to rectify a frontage which was based on the first line of the *Flandern I. Stellung.* This position, established by the Germans in 1917, was strongly held, abundantly furnished with machine-guns and barbed wire, and supported by the artillery disposed on the whole front from Handzaeme to St. Pieter.

The first days of Oct. marked a halt in the operations. Only on the outskirts of Oostnieuwkerke and of Moorslede were there any lively combats. In front of the British the Germans menaced by the salient of Moorslede were withdrawing progressively their front line to the line of Wedlghem–Comines–Warneton, in front of which the troops of Gen. Sir H. Plumer installed themselves at 17:00 hours.

To sum up, the Belgo-British offensive which was delivered on Sept. 28 gave the most highly satisfactory results.

The progress realized had carried the Allied front about 15 km. from their starting point. The whole of the heights of Flanders was conquered. More than 8,000 prisoners, of which 6,000 were taken by the Belgians, were captured. 500 guns, machine-guns and material in proportion were the spoil of the victors. Thirteen German divisions had been engaged.

This rapid advance carried the Allied divisions beyond the zone of country so deeply cut up during the battles of Ypres. It was not possible to continue the advance before having built up across this historic stretch of mud sufficient communications for food and supplies for the troops. The reëstablishment of a network of communications in this country, so completely cut up and full of water, constituted a delicate and most arduous task, which in spite of all efforts ought to have stopped the operations for a considerable time.

The crisis was most acute for two or three days, and certain divisions existed altogether on food supplies thrown from aeroplanes. Thanks to the most vigilant activity the troops found themselves ready to take up the offensive on Oct. 14. The success took them this time to Bruges and Courtrai, and assured the freeing of the coast and evacuation of the region round Lille.

Battle of Courtrai–Thielt–Thourout.—The battle of Sept. 28–29 had put the Belgo-British in possession of the heights of Flanders, and had taken the Allied armies in one bound beyond the country of the Ypres battles. The reëstablishment of communications across this zone absorbed the first days of Oct. On Oct. 6 the King of the Belgians sent out instructions for the continuance of operations.

The intention of King Albert was that, taking as a base of departure the positions conquered at the end of Sept., the Belgian right flank and the British on the left flank should push vigorously toward the last and seize the knot of communications at Thourout, Thielt and Courtrai.

These points conquered, an advance should be made from Thourout in the direction of Bruges, which would inevitably insure the deliverance of Ostend and of all the coast. Proceeding from Courtrai and combining their movements with the British I. Army which was marching on Valenciennes, the British II. Army would undoubtedly cause, probably without fighting, the liberation of the populous and industrial region Lille–Roubaix–Tourcoing. In consequence the Belgian army, reinforced by the French VII. and XXXIV. Corps, would seize the plateau of Hooglede–Gits and the centres of Thourout, Thielt and Oostroosebeke, and then be prepared to follow the enemy towards Bruges and Ghent. The British II. Army would carry on the front on the Lys from Harlebeke to Menin. It would proceed to follow the enemy as far as the Scheldt. The II. Cavalry Corps and two divisions of French infantry would remain under the immediate orders of the King as a mobile reserve.

From Oct. 7 the corps commanders had caused the necessary cannonade to effect breaches in the wire entanglements and for the destruction of the most important enemy defences. On Oct. 14 the general attack was launched at 05:30 hours without any further artillery preparation.

The German order of battle was as follows from N. to S.:—38 Div. L.; 3 Div. R.; 36 Div. R.; Div. Guards Reserve; 1 Div. R.B.; 6 Div. R. B.; 11 Div. R.; 56 Div.; 12 Div. These divisions had all their three regiments side by side and in each regiment two battalions were placed in the first line. They were on the alert, and the three battalions occupied their battle positions.

However, the first lines of the enemy were quickly captured. The German defence was chiefly based on the employment of machine-guns. The Allied smoke-shells created a dense cloud which in the majority of cases prevented the enemy from making effective use of his weapons. The reply of the German guns was very serious, and very many heavy pieces on rails were employed. In the course of the day, six support divisions were brought into the line: they were used less for counter-attacking than to strengthen the front where broken.

In the evening the northern Belgian group had conquered Handzaeme as well as Cortemarck: the French, assisted by many sections of tanks, had secured Hooglede and Roulers.

The southern Belgian group, led by the valiant 3rd Div., had completely defeated the Guards Reserve Div. and the Bavarian 1st Reserve Div.: they had taken Rumbeke, Ouckene, pushed almost to the gates of Iseghem and captured 1,300 prisoners and many batteries, of which some had both teams and personnel.

Further S., the British forces had thrown back the enemy on the Lys in the neighbourhood of Menin, and had taken Wynberg, the western outskirts of Gulleghem and Wimkel St. Eloi. 20 enemy aeroplanes had been brought down.

On Oct. 15, while the Belgians in the N. gained ground to within 2 km. of Thourout and the British in the S. captured Gulleghem and then Heule, the indefatigable 3rd Div. (Belgian) passed through Lemdelede at 11:00 hours and Cappelle Ste. Catherine, and the 9th Regt. of the line pushed on irresistibly almost to Bavichove near the Lys.

On Oct. 16, after half an hour of artillery preparation, the attack recommenced on the whole front. The northern Belgian group captured the wood of Wymedaele and of Thourout, the French pushing on beyond Lichtervelde and Ardoye; the southern Belgian group occupied Iseghem and Ingelmonster, the 3rd Div. touching the canal at Roulers and the Lys at Oyghem and Bavichove. Thus were gathered the fruits of victory. The enemy front, everywhere completely shaken, beat a retreat. The German Marine Divs. evacuated the coast sector which they had guarded for four years.

Explosions and fires announced that the enemy was destroying his installations and his depots at Middlekerke, Smaeskerke, at Ostend and Guistelles. In the evening the coast-guns, levelled for so many months toward the sea, fired in haste some rounds at the Belgian bivouacs before being rendered useless.

On Oct. 18, in the evening, the Belgian front reached Zeebrugge and Bruges. The British bordered all the Lys from Menin to Harkebeke and penetrated into Courtrai.

On Oct. 20 the Germans were thrown back on the canal of the Lys behind which they momentarily held a position from Eccloo to Deynze. The British II. Army crossed the Lys at Courtrai, occupied on the right Rolleghem and Leers, and made certain the evacuation of Roubaix, while the left was pushed toward Anseghem. By Oct. 31 the British had reached the Scheldt from Kerkhove to Pecq, joining the British V. Army.

The battle of Thourout–Thielt–Courtrai was finished. Under protection of their rear-guards the broken German front turned itself to the E., followed by the Allies as quickly as the restoration of the network of roads permitted.

From Oct. 14 to 31 the group of the armies of Flanders had taken 19,000 prisoners and advanced 50 km. It had gloriously achieved the double mission entrusted to it by King Albert: the region of Lille was entered and set free; the coast and an important portion of Belgian territory had been reconquered.

Belgians, British and French had rivalled each other in their ardour and bravery. The submarine base of Bruges, the famous batteries of Tirpitz, Hindenburg and Deutschland, and more than 100 coast-defence guns of very great calibre remained as trophies taken from the enemy,—marking the downfall of the ambitions of the Germans. (R. VAN O.)

YUAN SHIH-K'AI (1859–1916), Chinese statesman, born 1859, first attained distinction in Korea, when, as Imperial resident and the trusted lieutenant of the Viceroy Li Hung-Chang, he strove to preserve China's suzerainty over the Hermit Kingdom in the years of strife which preceded the war between China and Japan (1894). After that disastrous campaign he held office under the Viceroy Li in Chihli; in 1898 he was in command of an army corps and played a decisive part in frustrating the Emperor's plan of constitutional reform and in supporting the Empress Dowager's reactionary *coup d'etat*. After her return to power he rose rapidly; during the Boxer rebellion, as governor of Shantung, he displayed sagacious foresight in the protection of foreigners, and upon the death of Li Hung-Chang succeeded his chief as Viceroy of Chihli. At the time of the death of the Empress Dowager (1908) he was a Grand Councillor and her most trusted adviser; but upon the accession to power of Prince Chun as regent he was dismissed from office (in retribution for his failure to support the Emperor in 1898) and ordered to return to his native place in Honan (Jan. 2 1909). He remained there, in disgrace, until the outbreak of the revolution in 1911, when the regent and the court, alarmed at the rapid spread of the movement, turned to him for help. By an edict of Oct. 14 he was appointed Viceroy of Hunan and Hupeh and commander-in-chief of the Imperial forces. As military dictator he took the field a fortnight later against the revolutionary army at Hankow. Thereafter, until his death (June 1916) the Government of China, such as it was, lay in his hands. After the abdication of the Manchu Dynasty, which he had done his best to uphold, he accepted the Presidency of the Republic and took the oath of office in March 1912; but he did so with mental reservations which were obvious to those who had followed his career and observed his policy. As President he displayed statesmanship of a high order under conditions of exceptional difficulty. Judged by European standards, his methods were often indefensible, but until he aspired to found a new dynasty in his own person (1915) their ruthlessness and venal expediency were generally accepted by the nation without indignation, and regarded as consistent with time-honoured traditions of rulership. All his efforts of statecraft were steadily directed towards restoring the authority of the central Government, shattered by the revolution, and with it, the principles and practice of benevolent despotism. His monarchical plans were skilfully laid and would probably have succeeded if he had had to deal only with his own people; they failed, and he died a broken and humiliated man, because he had not allowed for the probability of intervention by the Japanese Government. His enthronement as Emperor had been fixed by proclamation for Feb. 9 1916; before that date the Yünnan rebellion had vindicated the "advice" of the Japanese minister at Peking, and the end of his career was in sight. But he declined to resign the Presidency, and died, as he had lived, in harness.

YUDENICH, NIKOLAI (1862–), Russian general, was born in 1862 and entered the army in 1881. Passing out of the General Staff College in 1887, he spent the rest of his military service on the general staff and specially in Turkestan, till in 1902 he became a regimental commander. In the Russo-Japanese War of 1904–5, in which he was wounded, he had the reputation of a valiant and careful chief. He became a general and commander of a rifle brigade in 1905, assistant chief-of-staff of the Caucasian military district in 1907, and chief of the same staff in 1913. Having carefully studied the Caucasus and its army, he was quite prepared for the conduct of operations on this front, and at the beginning of the World War he rendered great services in the crisis and victory of Sarikamish as commander of the II. Turkestan Corps. Soon afterwards he was put in command of all the military forces of the Caucasus, which he held during the operations of 1915 until the arrival of the Grand Duke Nicolai. He continued to serve on this front under the new governor-general and played a leading part in the operations which led to the fall of Erzerum on Feb. 16 1916. In the summer campaign further progress was made, and Baiburt and Erzinjan were taken. Later, when the advance had outrun the organization of the rear, the situation was saved by his prompt manœuvres.

In March 1917, on the departure of the Grand Duke, Gen. Yudenich again undertook the command of the Caucasian armies, but here, as elsewhere, further advance was paralysed by the increasing disorganization of the Russian army. In the course of the civil wars Gen. Yudenich in 1920 carried out a campaign from the Baltic provinces against Petrograd, but unsuccessfully.

YUGOSLAVIA, or JUGOSLAVIA.—The "Kingdom of the Serbs, Croats and Slovenes" (*Kraljevina Srba Hrvata i Slovenaca*), more commonly known as Yugoslavia, came into being in the closing months of 1918 as a result of the collapse of Austria-Hungary and the voluntary union of its Yugoslav territories with the former Kingdoms of Serbia and Montenegro. In point of international law, its existence may be said to date from Dec. 1 1918, when the Prince-Regent Alexander of Serbia formally complied with the invitation of the Yugoslav National Council to assume the regency over the sister provinces also. That the Great Powers were so long in according official recognition to the new state was due to purely political reasons connected with the Adriatic dispute.

Yugoslavia consists of the former independent Kingdoms of Serbia and Montenegro; the triune Kingdom of Croatia–Slavonia–Dalmatia (of which the first two enjoyed special autonomy under the Kingdom of Hungary, and sent 40 delegates from their own Parliament in Zagreb to that of Budapest, while the third was one of the 17 provinces of the Austrian Empire, with a local diet at Zara); parts of the Banat, Bačka and Baranja (which were integral portions of Hungary proper); Slovenia (consisting of portions of Carniola, Carinthia, Styria and Istria, each holding a position in Austria analogous to Dalmatia); and Bosnia-Herzegovina (which was from 1878 to 1918 under the joint administration of Austria and Hungary and had its own diet since 1910). Fiume, which from 1867 to 1918 had been an

autonomous unit under Hungary, has by the Treaty of Rapallo been constituted as an independent State. Italy has acquired almost all the Slovene and Croat districts of Gorizia and Istria.

A census of the new State was taken in the spring of 1921, the total pop. being 12,162,900.

Early Tendencies Toward Unity.—The Yugoslav movement was by no means a recent one, as is often assumed. Despite the different traditions of culture due to the rival ecclesiastical influence of Rome and Byzantium, a sense of kinship had survived throughout centuries of separation, and was strengthened by continual migration. The two most notable cases were the formation of the Uskok pirate settlements along the Dalmatian coast in the 16th century, and the settlement of the Serbian patriarch and many thousand Serb refugee families in Slavonia and S. Hungary, at the invitation of the Emperor Leopold I. in 1690. Ivan Gundulić and the brilliant group of poets that gathered round him at Ragusa in the early 17th century, reflected in their writings the little Slav Republic's intimate connexion with its kinsmen of Serbia and Bosnia. The first advocate of the Pan-Slav idea in Russia itself was Križanić, a Croat Catholic priest from Dalmatia, and early writers in favour of Slavonic racial and literary unity were the Slovene schoolmaster Bohoricz (1584) and the Dalmatian Croat Orbini, who wrote in Italian (*Il regno degli Slavi* 1601). The Franciscan friar Kačić, who did so much for the revival of popular poetry in Bosnia and Dalmatia in the mid-18th century, shows similar traces of Serbophil feeling, and the achievements of Dušan and other Serbian Tsars have bulked almost as largely in the modern literature of the Croats as of the Serbs themselves.

The first active impulse toward political unity was given by Napoleon, when after Wagram he erected the Slovene districts and most of Croatia and Dalmatia into a separate Illyrian State, incorporated in the French Empire, but having its administrative capital at Laibach. This short-lived experiment, which inspired the muse of Vodnik, the first Slovene poet of real mark, had its aftermath in the Illyrian movement of the forties, which centred in Zagreb, the Croatian capital. Its real motive force was supplied by Ljudevit Gaj, who combined to a remarkable degree the qualities of author, philologist and political agitator. His two newspapers, the *Illyrian National Gazette* and the *Danica Ilirska* (*Illyrian Daystar*) provided a literary focus for the rising generation; while his reform of Croat orthography, planned on parallel lines with Vuk Karadžić's epoch-making philological work in Serbia, assured to modern Serbo-Croat literature a definitely unitary development. The fact that linguistically Serb and Croat had thus become interchangeable terms, only to be distinguished by the respective use of the Cyrillic and Latin alphabets, inevitably reacted upon the political situation, and served as an incentive to the movement for unity. In somewhat sensational and affected but prophetic words Gaj compared Illyria to a lyre, "a triangle between Skutari, Varna and Villach. Its strained and inharmonious chords are Carinthia, Gorizia, Istria, Croatia, Slavonia, Dalmatia, Ragusa, Bosnia, Montenegro, Herzegovina, Serbia, Bulgaria and Lower Hungary," and "on the great lyre of Europe they must harmonize once more." He saw in the Magyars the chief obstacle to the realization of his dream, and openly warned them that they were "an island in the Slav ocean," which one day might easily engulf them. The alienation of Croat and Magyar—for centuries close allies in the struggle against the Turk—grew rapidly in the 'forties, mainly owing to the aggressive legislation passed by successive Hungarian diets, and tending to curtail Croatia's ancient liberties and extend the sway of the Magyar language. It was a fertile soil for Gaj's agitation, and in 1848 the Croatian nation found in Baron Jelačić a military leader who voiced the Illyrian idea and hoped to realize it in union with the Habsburg Dynasty and the other subject nationalities of Hungary. It is highly significant that Jelačić as Ban of Croatia went hand in hand with the newly elected Serb-patriarch Rajačić: that Croats and Serbs, including many volunteers from the principality of Serbia, fought side by side against Hungary, and that the poet-prince-bishop Peter II. of Montenegro wrote to Jelačić, expressing his solidarity with the movement.

Croatia after 1848.—After the collapse of the Hungarian revolution in 1849, the Croats, in the words of Pulszky, received as reward the same absolutist *régime* which had been imposed upon the Magyars as punishment. Jelačić and Gaj died as disappointed men, and the very general resentment aroused by the ingratitude of Francis Joseph vented itself also against the name of Illyria, which rapidly disappeared from the political arena. But its place was taken more and more by Yugoslavia, which, it should be remarked, was then still used to denote all the territories inhabited by any southern Slav tribe, and so to include the Bulgars no less than the Serbo-Croats and Slovenes. On the intellectual side the new movement found its champion and its Maecenas in Bishop Strassmayer, who for over 50 years devoted the surplus revenues of the wealthy see of Dya Kovo (Djakovo) to national purposes, and was mainly instrumental in founding at Zagreb the southern Slav Academy (1867), the first Croat university (1874) and a modern gallery and school of arts. Historical research and literary criticism flourished under Rački, the first president of the Academy, and his pupils: while Strassmayer did much to revive the Glagolitic, or ancient Slavonic liturgy, and to win for it the favour of Pope Leo XIII. Close relations linked the great Bishop with Prince Michael, Serbia's ablest modern ruler, and with Prince Danilo of Montenegro who assured Michael, "Form the Kingdom of Serbia, and I will mount guard before your palace."

The Dual System.—In the late 'sixties the Yugoslav idea met with a serious set-back. Prussia's victory forced Austria to come to terms with the Magyars: and the bargain was sealed by the *Ausgleich*, or Dual System, at the expense of the lesser nationalities. Within certain limits Croatia's autonomy was respected, but so far from Zagreb being consulted, the terms of the new settlement were in effect dictated from Budapest and only submitted *pro forma* to a carefully "packed" Croatian Diet, after the bargain between Budapest and Vienna had already made of them an accomplished fact. Meanwhile the murder of Prince Michael in the same year deprived Serbia of a great statesman and the movement for unity of a possible head. During the 'seventies Austro-Hungarian policy was increasingly successful in checking intercourse between the Yugoslavs of the monarchy and those outside its bounds. Meanwhile the newly constituted "Party of Right," resting upon a narrow Catholic clerical basis, aimed at the reunion of Dalmatia with Croatia-Slavonia in the so-called Triune Kingdom, within whose bounds it affected to deny the very existence of Serbs. This Pan-Croat ideal was favoured in Vienna as a convenient rival to Pan-Serbism with its centre in Belgrade; but its natural effect was to drive the Serbs of Slavonia and S. Hungary into the arms of Budapest. The insurrection of Bosnia against the Turks only served to increase party discords: for though it aroused the keenest sympathy of all Serbs and Croats, and thus furthered the sense of racial affinity, it gave rise to rival claims upon Bosnia which could be exploited in the interest of Vienna and Budapest. The official policy of Baron Kállay, for 20 years the administrator of Bosnia, was to taboo the name of Serb in the hope of creating a distinct "Bosnian" nationality.

The period between 1883 and 1903 is the most humiliating in the modern history of the southern Slavs. Count Khuen-Hedérváry, as Ban of Croatia, reduced political corruption to a fine art and governed by playing off Croat and Serb against each other, and fanning the dying flames of religious bigotry: while at the same time Serbia under King Milan was reduced to the position of a mere satellite of Vienna. The humiliating secret treaty concluded between Austria-Hungary and Serbia in 1881 had specially pledged the latter to repress any nationalist agitation against the Dual Monarchy, even in respect of that Bosnia for which Serbia had risked her existence four years earlier. Disunion had reduced the Yugoslavs to an almost negligible quantity in Balkan politics.

The National Revival in Croatia.—After the turn of the century, however, a new generation arose both among Croats and Serbs, which had received its education abroad, and especially in Prague, where the ethical and political teachings of Prof. Masaryk exercised a remarkable influence over the progressive youth of all Slav countries. All thinking men were increasingly conscious that no progress was possible until Croat and Serb presented an united front against German-Magyar predominance. The first signs of reviving solidarity came in 1903, when Khuen's rigorous suppression of rioting in Zagreb and several country districts of Croatia, led to demonstrations of protest throughout Dalmatia and Istria. Thirty Croat deputies of those provinces resolved to lay their kinsmen's grievances before the Emperor, and his refusal of an audience played a material part in alienating Croat sympathies from the Crown. It is not uninstructive to note that as the same year 1868 witnessed a setback in both Croatia and Serbia, so the same year 1903 marks a parallel revival in national consciousness in both countries, coincident with the fall of Khuen-Hedérváry and the removal of the Obrenović dynasty. Abroad the new King's position was prejudiced by the hideous crime which led to his accession, but among his own people this was from the first atoned for by the introduction of a real constitutional *régime* and increased political stability. The Serbian court, instead of being a centre of perpetual scandal and misrule, resumed its true position as a focus of national aspirations, and this change was not lost upon the Yugoslavs of "the other side."

Resolution of Fiume.—The advocates of political coöperation between Serb and Croat saw their opportunity in the constitutional conflict which broke out between Crown and Parliament in Hungary: and on Oct. 4 1905 40 Croat deputies from Croatia, Dalmatia and Istria formulated in the so-called "Resolution of Fiume" a complete programme of political reform, and defined the basis upon which solid friendship between Croats and Magyars seemed attainable. The prime movers in this action were Dr. Trumbić, a leading Dalmatian advocate and mayor of Spalato, and Mr. Supilo, also a Dalmatian, the editor of the *Novi List* at Fiume. Ten days later 26 Serb deputies from the various provinces of the monarchy, met at Zara, indorsed the principles embodied in the Resolution of Fiume and declared in favour of joint political action between Croats and Serbs. It is worthy of note that the Resolution of Fiume anticipated the modern doctrine of self-determination by the very explicit assertion that "every nation has the right to decide freely and independently concerning its existence and its fate." On Nov. 14 the Croat and Serb parties in the Diet of Dalmatia publicly affirmed the principle that "the Croats and Serbs are one nation": and this standpoint has never since been abandoned. The Serbo-Croat coalition, formed on the basis of the Fiume Resolution, at once acquired the mastery in Croatia, and even when its short-lived alliance with the Hungarian coalition—in power in Hungary since April 1906—was replaced by acute conflict in the summer of 1907, no amount of repression from Budapest could destroy its solid majority in the Croatian diet. Baron Paul Rauch, the Magyar nominee as Ban, failed, with all his official apparatus, to secure a single seat for his creatures at the general election of 1908, and therefore proceeded to govern without Parliament, by an elaborate system of administrative pressure, press persecution and espionage. Under his *régime* Magyar intolerance of Croat national aspirations joined hands with the designs of the Ballplatz against Serbia in connexion with the impending annexation of Bosnia.

Friedjung Trial.—The treason trial which opened at Zagreb in March 1909 pursued the parallel aims of intimidating the

Serbs of Croatia, of splitting the new-found unity of Serb and Croat and of proving to the outside world the existence of a dangerous Pan-Serb movement organized from Belgrade inside the monarchy and amply justifying the countermove of annexation. None of these aims were attained; for the trial, which turned on the evidence of the police spy Nastić (already chief witness in the doubtful Cettinje bomb trial of 1908) degenerated into a public scandal, owing to the conduct of the judges and public prosecutor, and rallied Croat public opinion in defence of the 53 Serb victims. Serbo-Croat solidarity became still more apparent when the Austrian historian Dr. Friedjung, in the *Neue Freie Presse* of March 25 1909, openly charged the leaders of the Serbo-Croat coalition with being in the pay of Serbia. This article, which was based upon a mass of incriminating documents supplied to Friedjung by the Austro-Hungarian Foreign Office, had been timed to coincide with the outbreak of hostilities against Serbia, and was to have been the first of a series convicting the Serbian Government and dynasty of aggressive and even murderous designs. When at the last moment war was averted by the surrender of Serbia and Russia, an attempt was made to withdraw the article, but the first copies had already been issued: and Count Aehrenthal now had the double embarrassment of the Zagreb trial, which no longer served any purpose of foreign policy, but suited the aggressive game of Budapest against Zagreb, and of a libel action brought against Friedjung by those leaders of the Serbo-Croat coalition whose honour he had impugned. Despite the Ballplatz's efforts at postponement, the trial took place in Vienna in Dec. 1909, and revealed the documents upon which Friedjung had relied, as impudent forgeries concocted by subordinate officials of the Austro-Hungarian legation in Belgrade, with the connivance of the minister, Count Forgács. The responsibility was finally brought home to Forgács by Prof. Masaryk in a famous speech before the Austrian delegation: and Aehrenthal preserved an embarrassed silence when his minister was bluntly compared with Azev, the Russian *agent provocateur*.

The Cuvaj Dictatorship.—The triumphant vindication of Mr. Supilo and his colleagues of the Serbo-Croat coalition gave a fresh incentive to the idea of unity throughout the southern Slav provinces of Austria-Hungary. Rauch's position had become untenable, and he was succeeded by the more moderate Dr. Tomašić, who brought with him from Budapest the concession of a somewhat extended franchise (260,000 instead of 50,000 electors). His attempt to emancipate himself from the control of the coalition at the general elections of Oct. 1910 failed miserably, and after a year of temporizing, he suddenly threw off all pretence at legal forms, dissolved the Diet almost before it had met, and in Dec. 1911 ordered new elections. But in spite of wholesale terrorism he only succeeded in wrenching five more seats from the coalition, and on Jan. 19 1912 was replaced as Ban by a little known official Mr. Cuvaj, who promptly dissolved the Diet before it had even met, and proceeded to muzzle the press, to close the university and to arrest several prominent politicians. On April 3 the Croatian constitution was completely suspended by royal decree, and Cuvaj invested with far-reaching dictatorial powers. An attempt on his life by the student Jukić (June 8) was followed by still more reactionary measures, and on July 11 the autonomy of the Serbian orthodox church in Slavonia and Hungary was also suspended.

The Cuvaj *régime* had a magical effect in furthering the movement for Yugoslav unity. Specially significant were the Memorandum addressed to the throne by 55 deputies of the Croat party of Right, in the Croatian, Bosnian, Dalmatian and Istrian Diets, and the political strike organized by the pupils of both sexes in almost all the middle schools of the Slavonic South. This gave rise to sympathetic demonstrations in many Dalmatian and Bosnian towns, and to a series of interpellations and speeches by the Yugoslav and Czech deputies in the Parliament of Vienna. The Slovenes—clericals no less than progressives—became increasingly active in the Yugoslav movement, and their press began to demand the abandonment of the distinctive Slovene dialect as a hindrance to unity.

Balkan War.—It was peculiarly unfortunate for Austria-Hungary that the Cuvaj *régime* should have been at its very height when the Balkan League achieved its dramatic victory over the Turks. The battle of Kumanovo in particular was greeted with indescribable enthusiasm throughout the Yugoslav provinces. The Serbian and Bulgarian anthems were sung on the streets, collections were made in every village for the Balkan Red Cross funds, and when Austria-Hungary mobilized, protests were heard on every side against the bare possibility of war with Serbia, which to the Yugoslavs would be a veritable civil war. The Austrian Government committed the grave blunder of answering these demonstrations by press confiscations and by the dissolution of the town councils of Spalato and Sebenico. This, however, was promptly countered by a monster meeting of protest at Zara on Nov. 24, attended by all but three of the Serbo-Croat deputies of Dalmatia, and delegates of almost every municipality in the province. Doctor Drinković, leader of the Dalmatian clericals, openly declared that "in the Balkan sun we see the dawn of our day!" and the Catholic Bishop of Cattaro greeted the news from Monastir by reciting the *Nunc Dimittis*. On all sides Serbia was now regarded as the southern Slav Piedmont: and the Dual Monarchy's consistently hostile policy toward Belgrade, and its only too successful efforts to set Serbia and Bulgaria by the ears, intensified the excitement and resentment among its Yugoslav subjects. The Trialist solution (which would have united the Yugoslav provinces of Austria-Hungary in a third state enjoying equality with the two existing partners) rapidly lost popularity, even among the clerical parties, which had been attracted by the prospect of Catholic predominance in such a State.

On Dec. 27 1912 Cuvaj was replaced by a colourless official, Dr. Unkelhäusser, who marked time until a fresh candidate for the post of commissary or dictator was forthcoming in the person of Baron Skerlecz (July 23 1913). This appointment, at a moment when Austria-Hungary was again contemplating war with Serbia, naturally increased the ferment, and on Aug. 18, a determined attempt was made upon the life of Skerlecz by a young American Croat. At length on Nov. 30 Skerlecz was made Ban, the illegal decrees of Cuvaj revoked, and general elections ordered—the fifth since 1906. The coalition maintained its majority, the Government only obtaining ten seats: but though this time the Diet was allowed to meet, no attempt was made to satisfy Yugoslav aspirations or to solve the real issues at stake between Hungary and Croatia. More and more the situation in the south of the monarchy was allowed to drift. The political leaders were far more conscious than either Vienna or Budapest of the volcanic state of public opinion: but when in genuine alarm and from a sense of impotence they attempted to restrain their followers, the only result was a loss of influence over the younger generation, which had become increasingly infected by revolutionary ideas. Among the Yugoslavs the students had always dabbled unduly in politics, and this tendency was accentuated by the widespread unrest and excitement which followed upon the Balkan upheaval. On the eve of war the university and middle-school students had five or six newspaper organs of their own—notably *Jugoslavija* in Prague, *Val* in Zagreb and *Jedinstvo* in Spalato—which advocated more radical action alike in politics and literature. Nor is it surprising that the hotheads among them, fired by the example of Jukić and other would-be assassins of Varešanin, Cuvaj and Skerlecz, should have indulged in terrorist projects. From this group came the young Bosnian Serb students Princip, Čabrinović, Grabež and others, who murdered the Archduke Francis Ferdinand and the Duchess of Hohenberg at Sarajevo on June 28 1914, and thus lit a spark in the European powder magazine.

The World War.—Immediately on the outbreak of the World War measures of extreme severity were taken by the civil and military authorities of Austria-Hungary throughout their Yugoslav provinces. The exact number of persons arrested or interned will probably never be known, but that the Yugoslavs were regarded, and treated, as a hostile population, is abundantly proved by the three following facts, which could be multiplied indefinitely. Doctor Tresić-Pavičić, the Dalmatian-Croat deputy, was informed by one of the judges who examined him that over 5,000 had been imprisoned in Dalmatia, Istria and Carniola. In the single internment camp of Arad there were 3,400 deaths among the victims from Bosnia alone; and Father Nikolić, a Catholic priest from Istria, testified to having himself buried over 2,000 Istrian victims, and Doctor Martinović to a knowledge of 8,000 fatal cases in the Styrian camps. In Dalmatia the leading deputies (*e.g.* Smodlaka, Čingrija, Tresić, Drinković) and many priests, advocates, doctors and other intellectuals were arrested, some being used as hostages and forced to accompany railway patrols, under the threat of instant death in case of sabotage by the population. All the municipal councils in Dalmatia (with the solitary exception of Zara, which had an Italian majority) were dissolved at an early stage in the war. Among the Slovenes of Istria and Carniola there were also numerous arrests, and the *Matica Slovenska*, the chief Slovene literary society, was dissolved and its funds confiscated. Press censorship was of course very rigid throughout the Dual Monarchy, but many Yugoslav newspapers were suppressed altogether. It was perhaps natural that repression should be specially severe in Bosnia. There were wholesale internments, conducted with the utmost brutality: and the horrors of the camps of Doboj, Mostar, Arad, Thalerhof, Möllersdorf, Gmünd, were early in 1918 revealed by Doctor Tresić in the Austrian Reichsrat. After the Archduke's murder the headquarters of various Serbian institutions in Sarajevo had been sacked by mobs, with the open connivance of the police: after the outbreak of war practically all Serb societies and schools were closed in Bosnia. At a later stage the Orthodox calendar and the Cyrilline alphabet were prohibited, and this was actually enforced in Serbia itself during the Austrian occupation, and in the Serbian districts of Hungary from July 1916 onward. Bosnia was also the scene of a succession of monster political trials. In March 1915, 28 schoolboys of Banjaluka were sentenced to terms varying from two years to four months for founding a local Yugoslav society. In July 65 schoolboys from Sarajevo and Travnik received similar sentences, and again in Oct. 38 more boys from Tuzla were condemned to a total of 156 years. In Nov. 1915 at Banjaluka 151 prominent Bosnian Serbs—including 5 deputies and 20 orthodox priests—were put on trial for treason: and eventually 16 death sentences were passed, and terms of imprisonment totalling 858 years and a collective fine of 14 million crowns, were passed. Worse even than this was the system of wholesale expatriation adopted as a punishment for those who had shown a friendly attitude to the invading Serbian army. During the spring of 1915 the official organ at Sarajevo published list after list of Bosnian-Serb families who were thus declared to have forfeited their citizenship: and many thousands of women and children were driven across the Montenegrin frontier, often with only the clothes in which they stood. The motive was avowedly the same which in the Middle Ages led a mediæval garrison to drive the civil population of a town into the camp of its would-be deliverers. With every year of war the number of confiscations of property increased in the Yugoslav provinces, as in Bohemia and Transylvania—vengeance upon the families at home being widely used in order to deter Slav, Italian or Rumanian prisoners from enlisting in the various volunteer corps in process of formation on the Russian, Balkan and Italian fronts. In Croatia alone was there even a semblance of constitutional government. The diet of Zagreb was allowed to meet, and the Serbo-Croat coalition pursued a policy of pure opportunism, avoiding any pronouncement on matters of high policy, but buying a certain relaxation of *régime* in Croatia by supporting the Budapest Government and its nominee Skerlecz. But even this subservient and cautious House sometimes asserted itself: and on one occasion its vice-president Doctor Magdić proclaimed "the nation's constant desire for unification in a single and independent political body."

Yugoslav Propaganda Abroad.—Meanwhile a certain number of Yugoslav leaders had managed to reach foreign soil before the outbreak of war, and during the winter of 1914 constituted themselves as the Yugoslav Committee. Its two foremost leaders were Doctor Trumbić and Mr. Supilo (two of the makers of the Resolution of Fiume) and it also included Doctor Hinković (known as the chief advocate in the Zagreb treason trial), Ivan Meštrović the sculptor, the Slovene deputies Gregorin and Trinajstić, the Bosnian Serb deputies Stojanović, Srškić and Vasiljević, publicists of repute such as Marjanović and Banjanin, and prominent representatives of the Yugoslav colonies in North and South America, such as the scientist Pupin and the shipping magnate Baburica. Their original centre was Rome, but in view of the hostile attitude of the Salandra-Sonnino Government they transferred their activities to Paris and London early in 1915. They were in close and cordial contact with the Serbian Government, but rightly insisted on retaining entire independence of action, their funds being derived from their wealthy S. American supporters, who had long been enthusiasts for the Yugoslav idea. Their first public pronouncement was an appeal to the British Parliament and nation (May 1915) for sympathy with the cause of Yugoslav unity and the dissolution of Austria-Hungary. This formed a natural complement to the unanimous declaration of the Serbian Skupština in Dec. 1914 for a union of Serbs, Croats and Slovenes in one State.

Secret Treaty of London.—The entry of Italy into the war was a serious set-back to the Yugoslav cause, for under the Treaty of London (April 27 1915) she was to obtain, in the event of an Entente victory, wide districts in Gorizia, Carniola, Istria and Dalmatia, peopled by not less than 700,000 Yugoslavs. The frontier was to follow the watershed of the Julian Alps from Tarvis as far east as the Snježnik (Schneeberg) and to reach the sea just east of Volosca, Fiume being expressly reserved to Croatia. To Italy was assigned the northern half of the Dalmatian mainland as far as Cape Planka, and all the islands save Krk (Veglia) and Rab (Arbe) in the N., Solta and Brazza in front of Spalato, and the few which lie to the south of Meleda. The jealously guarded secret was discovered by Mr. Supilo in Petrograd within a few days of the signature of the treaty, and the main facts becoming known in Austria-Hungary, were skilfully exploited by her to rally the Croats and Slovenes in defence of their national territory. It was easy to represent the Entente as having betrayed the interests of Serbia and her kinsmen: and as for a time the Pašić Cabinet, in deference to the narrowly Orthodox influences then all powerful at Petrograd, was prepared to limit its claims to the mainly Serb and Orthodox provinces of Bosnia and Slavonia, and to leave the Catholic Croats and Slovenes to their fate, there was during the summer a certain revulsion of feeling in favour of Austria-Hungary, who appointed a Serb Orthodox frontiersman (Graničar), General Boroević, to the chief command on the Isonzo front. The conquest of Serbia, however, once more closed the ranks of the Yugoslavs, who saw in unity their sole hope for the future: and the desertions to the Entente which were so marked a feature of the first winter, became so rife as to render necessary a drastic revision of the Austro-Hungarian regimental system. Henceforth the various corps lost more and more their territorial character, one nationality was set to watch and control the other, and espionage and delation prevailed.

The Yugoslav Legions.—During the winter of 1915 delegates of the Yugoslav Committee, with the Tsar's special permission, began enrolling volunteers from among the prisoners on the Russian front; and by March 1916 a division of 23,000 men had been concentrated at Odessa, and a second was formed later. Serbian officers under General Živković were sent out, and many officers of the future Czechoslovak legions first saw service in this corps. The Yugoslavs greatly distinguished themselves during the Dobruja campaign (Nov. 1916), and their wounded shot themselves or each other on the battle-field, rather than fall as traitors or deserters into the hands of Austria. It was with this corps that Dr. Elsie Inglis and a detachment of the Scottish Women's Hospitals served as medical unit. After the Russian collapse most of the survivors were gradually drafted through Murmansk, England and France to the Salonika front: one brigade was cut off by the Bolshevik Revolution and had to be evacuated through Siberia. In 1916 the Yugoslav Committee had also set itself to recruiting among its compatriots in America, but in this case its success was hampered by many cross currents of republican, clerical, Austrian and Montenegrin feeling: and those who did actually volunteer showed considerable lack of discipline and were not always treated with the necessary tact by the Serbian military authorities.

The Yugoslavs inside Austria-Hungary.—The accession of the Emperor Charles, and the ferment aroused by the Russian Revolution, led to considerable political changes in both halves of the Dual Monarchy, the most notable being the dismissal of Count Tisza from the Hungarian premiership (May 23 1917), the grant of a general political amnesty, and the summons of the Austrian Reichsrat, which had not been allowed to meet since March 1914. No sooner was political life thus resumed than all the Slovene, Croat and Serb deputies of Austria united to form a "Yugoslav parliamentary Club," which entered into close alliance with the Czech Club. At the opening sitting (May 30) Czechs, Poles and Ruthenes defined their national attitude in formal resolutions, and the Slovene leader, Father Korošec, in the name of the Yugoslavs, demanded "the union of all the Yugoslav territories of the Monarchy in an independent state organism, free from the rule of any foreign nation, and resting on a democratic basis, under the sceptre of the Habsburg-Lorraine Dynasty." The last phrase was treated in some quarters as a proof of confirmed Austrophilism: in reality it was a minimum concession to the existing order, without which its framers could not have continued their activity. By this time it was sufficiently obvious that the Yugoslavs were tacitly if not explicitly agreed upon a triple parallel policy, framed for all contingencies. In Croatia the coalition was more opportunist than ever, and sent its delegates to the coronation of Charles as King of Hungary: by its compliance it obtained the appointment of its own nominee, Mr. Mihalović, as Ban, and was thus able to husband Croatian resources and on occasion to practise passive resistance. It accepted the *status quo* as a working basis, but no amount of pressure could wring from it a disavowal of Trumbić and his colleagues. Meanwhile the opposition parties openly allied themselves with the Yugoslav Club in Austria, which agitated for complete national unity, but saved itself from prosecution by occasional references to the dynasty and absolute silence regarding Serbia. It was left to the Yugoslav Committee abroad to claim independence as well as unity, to repudiate the Habsburgs (in a manifesto on the eve of the Budapest coronation) and to exalt the achievements of Serbia and the Karagjorgjević dynasty. The three groups communicated secretly through Switzerland, and it was felt that the time had come for the exiles to take a fresh step forward, in view of the prominence given to the doctrine of self-determination since the Russian Revolution and America's entry into the war. Moreover the collapse of Tsarism had deprived Mr. Pašić of his strongest support abroad, and forced him to abandon his narrowly Orthodox basis and bring his policy more into line with modern democratic tendencies.

Declaration of Corfu.—After some weeks of negotiation the so-called "Declaration of Corfu" was signed on July 20 1917, between Pašić as Serbian Premier (and in this case as the mouthpiece of all the Serbian parties) and Dr. Trumbić as president of the Yugoslav Committee. The signatories were careful to disclaim all idea of a pact or treaty, and to define the declaration as a mere statement of ideals and principles which could not acquire binding force until ratified by elected representatives of the nation as a whole. It may however be regarded as the birth certificate of the future Yugoslavia, and as fixing the lines of future development. After affirming that the Serbs, Croats and Slovenes constitute a single nation and appealing to the right of self-determination, it declared in favour of complete national unity under the Karagjorgjević dynasty, "a constitutional democratic and parliamentary monarchy, equality of the three national names and flags, of the Cyrilline and Latin alphabets, and of the Orthodox Catholic and Mussulman religions, equal rights for all citizens, universal suffrage in parliamentary and municipal life, and the freedom of the Adriatic to all nations." The future constitution was to be established after the conclusion of peace by a constituent assembly, which "will be the source and consummation of all authority in the State." A week later Trumbić and his colleagues were welcomed on the Balkan front by the Voivode Mišić with an impassioned speech in favour of unity. The Declaration of Corfu made a profound impression in Austria-Hungary, which was heightened by Mr. Lloyd George's speech in honour of Serbia at a luncheon given by the Serbian Society of Great Britain to Pašić (Aug. 8). The Zagreb press could only comment indirectly, but conveyed its meaning by insisting that the Reichsrat programme of May 30 was an absolute minimum. The growing self-confidence of the Austrian Slavs was shown by the bluntness of their refusal to coöperate with the new Premier, Doctor von Seidler, whose offer of portfolios to their leaders drew from Count Tisza a strong protest in the Hungarian Parliament. Under Magyar pressure Seidler explicitly condemned all schemes of federalism, and pledged the Government and even the crown itself not to adopt any reforms which did not leave untouched the existing provincial boundaries. The Czechs and Yugoslavs, finding the door thus shut in the face of their national aspirations, even in the modified Habsburg form, naturally stiffened in their opposition. On Dec. 18 they went so far as to demand national representation of their own at the peace negotiations with Bolshevist Russia at Brest Litovsk.

Pact of Rome.—During 1916–7 Italian public opinion, encouraged by Sonnino and his press organs, had been definitely hostile to the Yugoslavs, whom it denounced as mere Austrian agents. The facts regarding the Yugoslav legions and the services rendered by Yugoslav deserters at Gorizia and in the Trentino were simply suppressed. The disaster of Caporetto (Nov. 1917) had a sobering effect, and the need for solidarity on the part of all the subject nationalities of Austria-Hungary,—a category which included also Italians,—if Italy's chief enemy was to be overthrown, became increasingly apparent. Further causes for alarms were the secret meeting between General Smuts and Count Mensdorv, to discuss a separate peace between Austria and the Entente (Dec. 1917) and the public pronouncements of President Wilson and Mr. Lloyd George in favour of "autonomy" for the subject races, instead of the independence held out to them by the Allied pronouncement of Jan. 1917. In Dec. 1917 Mr. Wickham Steed succeeded in bringing together Trumbić and his colleagues first with General Mola and Signori Emanuel and Chiesi (of the *Corriere* and *Secolo*), and then with the Italian Irredentist Socialist leaders. Their informal discussions laid the basis for more serious negotiations between Trumbić and Signor Torre, representing an influential committee of Italian deputies and senators. The agreement signed between them in London on March 7 1918 laid down the basis of Italo-Yugoslav coöperation: it recognized each of the two nations to be equally interested in the completion of the other's national unity, and in the liberation of the Adriatic. It left territorial questions to be decided amicably after the war, "on the basis of the principle of nationality and self-determination," and mutually guaranteed the rights of national minorities. This agreement is known as the Pact of Rome, because it was publicly proclaimed at a "Congress of the Oppressed Nationalities of Austria-Hungary," held on April 8 in the Roman Capitol. The Yugoslavs were represented by Trumbić and his Committee and by 12 deputies of the Serbian Skupština, the Czechoslovaks by Beneš and Štefanik, the Poles by Zamorski, Skirmunt and Seyda, the Rumanians by Draghicescu, Lupu and Mironescu. Baron Sonnino held aloof, but Premier Signor Orlando, greeted the congress with enthusiasm, and the first result was a combined propaganda on the Italian front, organized by Allied delegates and members of all the national committees. The effect of the congress and of this propaganda was to hasten the disintegration in the Austro-Hungarian army, and the High Command (in a communiqué of July 27) admitted that wholesale defections of the Czechoslovaks and the Yugoslavs had materially contributed to Italy's brilliant stand against the last Piave offensive in June. Unfortunately, while the new Czechoslovak army was recognized by Italy and took its place in the front line, Baron Sonnino, for political reasons, vetoed the formation of similar Yugoslav legions, though General Diaz had consented, and though the Yugoslavs interned at Nocera and elsewhere were clamouring to be enrolled.

Collapse of Austria-Hungary.—Meanwhile the Roman congress was deliberately imitated by an imposing congress at Prague (May 16), at which Czech, Polish, Italian, Rumanian, Slovak and Yugoslav delegates attended. Among the latter were the mayor of Zagreb, the poet Vojnović, and prominent Serb, Croat and Slovene deputies of all parties, including the peasant leader Stephen Radić and the future minister Pribičević. Their resolutions, though necessarily vague, amounted to a pledge of mutual support in the cause of unity and independence. During 1918, the initiative among the Yugoslavs of the Monarchy fell more and more into the hands of the Slovenes, led by Father Korošec since the premature death of Monsignor Krek. The official recognition accorded to the Pact of Rome by Mr. Lansing in the name of America (May 31) was a fresh encouragement: and Korošec, after constituting a Yugoslav National Council for the furtherance of unity, convoked a new Slav congress at Lyublyana (Ljubljana) on Aug. 18. The demonstrative part taken by the prince-bishop Jeglić and the leading Catholic clergy, and the fact that the Emperor's birthday was entirely disregarded, was intended as an answer to those who claimed the Slovene Catholics as a bulwark of the Habsburg throne. The central authority in Austria was steadily breaking down, and the food crisis was rendered still more acute by the widespread formation of "Green Cadres"—well organized armed bands which held positions in the mountains and defied capture. As early as Feb. a mainly Yugoslav revolutionary committee had almost gained control of the Cattaro naval base, which would have fallen into Entente hands if the ringleaders, who crossed the Adriatic for help, had not been detained by subordinate Italian subordinates until the Pola squadron had time to crush the mutiny. Moreover the High Command viewed with alarm the growth of "Septembrist" doctrine among the troops—*i.e.* the insistence upon "peace by September" and a refusal to face a fifth winter in the trenches.

During the late summer the authorities in Vienna and Budapest keenly debated rival plans for solving the southern Slav question—in every case, however, in accordance with Austrian or Hungarian rather than Yugoslav interests. Strangely enough the only attempts to consult the Yugoslavs themselves were an audience to which the Emperor Charles summoned Father Korošec and a journey undertaken by Count Tisza in Sept., with the crown's approval, to Zagreb, Sarajevo and Dalmatia. This last attempt to win support for the Magyar solution was everywhere met with a blank refusal, and in Bosnia especially the Orthodox, Catholic and Moslem leaders united in a manifesto assuring him of their adherence to the full programme of Yugoslav unity. The surrender of Bulgaria (Sept. 30) naturally rendered the nationalities indisposed to concessions, and the Austrian Premier's admission that national autonomy was now inevitable was icily received. The Czech and Yugoslav spokesmen in the Reichsrat insisted upon separate representation at the peace negotiations, and the absolute right to decide their own future State allegiance (Oct. 1).

Events now followed each other with lightning speed. On Oct. 4 Austria-Hungary, in a note to America, accepted President Wilson's speeches as a basis of discussion, and on the 8th Baron Hussarek admitted that the Monarchy's internal structure must be modified, and "full-grown nations" determine their own future. This only precipitated the collapse, and while Count Tisza voiced Hungarian public opinion in declaring the basis of the Dual system to be shattered, the Yugoslav National Council was transplanted from Ljubljana to Zagreb and strengthened by the inclusion of representatives of all parties (Oct. 10). On the 16th the Hungarian Government declared in favour of personal union, and next day Hussarek published an imperial proclamation, dividing Austria (not Austria-Hungary) into four federal units (German, Czech, Yugoslav and Ukrainian) and leaving the Poles to make their own decision. This project was stillborn and pleased no one. Korošec in the name of the Czech and Yugoslav Clubs unreservedly rejected it and claimed that the future of both nations was an international problem which only the future Peace Conference could solve. Henceforth the Yugoslavs acted independently of both Vienna and Budapest: and when on Oct. 21 the news of President Wilson's answer to Count Burián's final peace note (refusing to negotiate save on the basis of a recognition of Czechoslovak and Yugoslav national claims) became generally known, the old *régime* vanished almost as if by magic. Extraordinary scenes took place in many towns, the troops tearing off their military badges with the Habsburg arms, and trampling them underfoot. National councils were speedily formed in Dalmatia and Bosnia, which arranged for the disarmament of the troops pouring northward from the broken Albanian and Macedonian fronts. As early as the 23rd a Croat regiment stationed in Fiume disarmed the Magyar militia and took possession of the town. On the 24th Count Andrássy was appointed joint foreign minister, but the machinery of State had ceased to work, and both the Austrian and Hungarian Cabinets were in *statu demissionis*. On the 28th (the same day on which the Czechoslovak Republic was born in Prague) the military command in Zagreb handed over its authority to the National Council, and next day the diet proclaimed the independence of Croatia from Hungary, and assumed control of Fiume. The arsenals of Pola and Cattaro were already in the hands of the insurgents; and the Emperor Charles, in the hope either of winning the favour of the new *régime* in Zagreb or of throwing an apple of discord between it and the Entente, signed a decree on Oct. 31 making over the whole Austro-Hungarian fleet to the Yugoslav State. This was not unnaturally interpreted by the Italian Nationalists as a proof of collusion between Zagreb and Vienna; nor was it generally known that as early as Oct. 4 Štepanek and Giunio, as delegates of the Czech and Yugoslav revolutionary committees, reached Italy in a fishing-boat, to concert with the Allies a general rising along the coast, but were closely imprisoned in Rome and not allowed to communicate with Doctor Beneš and Doctor Trumbić till nearly three weeks had been lost. But for this delay the fleet might have been in the Entente's hands a fortnight before the final Italian offensive opened on the Piave. Unhappily every step led to a fresh misunderstanding. The action of the Supreme Council in Paris in prescribing the frontier line of the secret treaty of London as the line of occupation under the Austro-Hungarian armistice was keenly resented by the Yugoslavs as a breach with Wilsonian principles. The Allies very properly insisted that the fleet must be surrendered into their hands, but before this could take place a deplorable incident occurred in Pola harbour, the "Viribus Unitis" being blown up by an Italian mine, with a Yugoslav admiral and crew on board. In Italy Baron Sonnino's frankly anti-Slav attitude threw the Pact of Rome into the shade: and the Consulta worked hard to prevent Yugoslavia's recognition by the Allies.

Rival "Great Serb" and "Yugoslav" Programmes.—That this recognition had not already been accorded before the collapse of the Central Powers began was due to disunion among the Yugoslavs themselves. During the summer America gave a lead to the Allies by accepting the Yugoslav programme, and after Austria's failure on the Piave there was a growing disposition on the part of the western Powers to fall into line with Mr. Lansing's very clear pronouncements. But Pašić, free from the restraints of a coalition and from all parliamentary control, had reverted to his original pan-Serb standpoint, and steadily declined to reconstruct his Cabinet on a wider Yugoslav basis. Trumbić on his part could not enter a purely Serbian Cabinet without prejudicing that freedom of choice of his compatriots in the Dual Monarchy, upon which the moral case of the Yugoslavs depended. A series of incidents proved the difference of outlook to be not merely personal but fundamental. In July Mr. Mihajlović, the Serbian minister at Washington, was summarily dismissed by Pašić, the reason being his refusal as a good

Yugoslav to transmit to the American Government a project assigning Bosnia to Serbia as "compensation" in the event of a patched-up peace. On July 25 at the London Mansion House Mr. Balfour publicly indorsed the full Yugoslav programme, as formulated by the Serbian minister, Mr. Jovanović: but the latter's full report to his home Government was answered by a severe snub, and during the winter he too was dismissed for his Yugoslav sentiments. When on Aug. 9 Mr. Balfour officially recognized the Czechoslovak National Council as "trustee of the future Czechoslovak Government," he was ready to extend a similar recognition to the Yugoslav cause, but as a preliminary condition he very reasonably insisted upon unanimity between those who claimed to represent the two groups of Yugoslavs. Pašić adhered to his standpoint, and even the efforts of Venizelos and Take Jonescu to bring him and Trumbić together were unavailing. When in the last week of Oct. the rival statesmen moved from London to Paris, all hope of Yugoslav recognition before the opening of the Peace Conference had vanished, owing to the stiffening in the attitude of Italy.

Zagreb declares Independence.—One of the first steps of the new Zagreb Government was to recognize Trumbić and his committee as its representatives abroad, and to send delegates to Switzerland to discuss the measures for consummating national unity. On Nov. 9 the Declaration of Geneva was signed by Pašić as Serbian Premier, Father Korošec, Doctor Čingrija (mayor and deputy of Ragusa) and Doctor Zerjav (a Slovene Progressive) for the Zagreb Council, Trumbić and four others for the Yugoslav Committee, and Trifković, Drašković and Marinković as chiefs of the Serbian opposition parties. "By this act," it was laid down, "the new State appears and stands from to-day as an indivisible state-unit and as a member of the Society of Free Nations. The former frontiers no longer exist." The Governments of Belgrade and Zagreb were to retain their former spheres until a constituent assembly, elected by universal suffrage, could draw up a new constitution. Yielding to the unanimous desire of the other delegates, Pašić officially requested the Entente to recognize the Zagreb Council as the supreme authority in the ex-Austro-Hungarian provinces, and Trumbić as its accredited representative in the West, until unification could be completed. The repeated efforts made by Pašić to avert so distasteful a decision were held to disqualify him from the leadership of the new united Cabinet, but in order to secure his renunciation it was found necessary to exclude the other party chiefs. This arrangement, however, never really came into force, for the simple reason that telegraphic communications between the West and Serbia were hopelessly irregular, and that events continued to move, with the advance of the Serbian army and civil authorities from the South and of the Italians from the West. On Nov. 8 Gen. Franchet d'Esperey received at Belgrade a Hungarian peace delegation under Count Károlyi, and concluded with them an armistice whose provisions still further complicated the situation. No orders were given for the evacuation of Slovakia; in Transylvania an impossible shaped line was drawn, such as left Cluj (Kolozsvar) and many pure Rumanian districts in Magyar hands; while the Rumanians were incensed by the assignment of Temesvár (Temisoara) and the whole Banat to Serbia. The Serbian army was also allowed to occupy the Bačka, Syrmia and Bosnia-Herzegovina, but no territory farther west: and for a moment it seemed as though an attempt was being made to leave the Croats and Slovenes to their fate and to form an aggrandized Serbia on the lines advocated by Pašić and Petrograd in the summer of 1915. Any such development was, however, averted by the advance of the Italian army beyond the Armistice line, in the direction of Ljubljana. For to meet this danger, the Zagreb Government urgently invited the assistance of the Serbian army, which during the final advance contained a large proportion of Yugoslav volunteers. The first Serbian troops entered Fiume on Nov. 18, and a most dangerous situation arose between them and the Italians in Istria and Dalmatia, which was only very partially mitigated by the dispatch of American military and naval forces to Trieste and Fiume. Much of the blame falls upon the Supreme Council, which shrank from the only effective means of allaying friction—immediate Allied occupation of the disputed zone, pending the decision of the Peace Conference. The Council's occasional outbursts against Italy only rendered Baron Sonnino still more intractable, and irritated Italian public opinion. No satisfactory solution was possible unless the Treaty of London was abrogated, and this involved the abandonment of other secret treaties to which Paris and London clung. America pointedly defined the Adriatic problem as a test case, but amid the pressure of other affairs it was allowed to drift.

Union proclaimed at Belgrade.—The equivocal attitude of the Entente toward the new State naturally hastened the process of union. On Nov. 23 the Zagreb National Council proclaimed the union of the territories under its control with the Kingdoms of Serbia and Montenegro, and invited the Prince-Regent of Serbia to assume the regency of the new State. This decision (passed with only one dissentient voice, but that unhappily Stephen Radić, the peasant leader) took formal effect on Dec. 1, when Prince Alexander, at the formal request of 24 delegates from Zagreb, proclaimed the union and repeated their cry "Long live free and united Yugoslavia." Meanwhile on Nov. 26 a hurriedly convoked national assembly at Podgoritsa had proclaimed the deposition of King Nicholas and his dynasty, and the union of Montenegro with Serbia in the new united State. The first Yugoslav Cabinet was constituted under Protić as Premier and Father Korošec as vice-Premier: Trumbić became foreign minister, and the other portfolios were divided more or less equally between Serbia and the new territories. Pašić was appointed principal delegate at the Peace Conference, with Trumbić, Vesnić (minister in Paris) and Žolger (a Slovene professor who had held office under Seidler in Austria).

The Adriatic Crisis.—Apart from agrarian riots in Slavonia and Bosnia, the transition to the new *régime* was accomplished with remarkable ease. Italy's claims upon Istria and Dalmatia rallied the Yugoslavs to the cause of national unity, and intense indignation was aroused by the action of the Entente in drawing an armistice line against Austria-Hungary almost identical with that prescribed by the secret treaty of London, and in sanctioning Italy's prompt occupation of the disputed territory. Friction was increased by a whole series of incidents along the coast, by the deportation of prominent Yugoslavs to Italy and by the entry of Italian troops into Fiume, despite the protests of the Yugoslav civil and military authorities (Nov. 18). Meanwhile the whole Nationalist press of Italy, actively encouraged by Sonnino and his entourage, opened a fierce campaign against the Yugoslavs and their western supporters, which rapidly developed into agitation against the Allies. By the close of the year the situation had become so envenomed that Bissolati, the foremost Italian advocate of conciliation, found it necessary to withdraw from the Orlando Cabinet, and on Jan. 11 1919 was howled down at a great meeting in Milan. At the Paris Conference there was from the first a deadlock in the Adriatic dispute. Clemenceau and Lloyd George found themselves between two irreconcilable standpoints—between Sonnino, who claimed the liberal fulfilment of their treaty pledges, with the addition of the port of Fiume, and President Wilson, who refused all cognizance of the secret treaties and regarded them as expressly abrogated by the Allies when they accepted his successive notes as the basis of the Armistice. The three western Powers were in the impossible position of judges in a dispute to which one was a party, while the other two were accessories: the only Great Powers from whom an impartial verdict could be expected were Japan, who resolutely held aloof from purely European quarrels, and America, who quite logically regarded the Adriatic as a test case for the application of the new order in Europe. It was on these grounds that the Yugoslavs, from whom the treaty had always been carefully concealed and who had of course never recognized its validity, offered to submit the whole dispute to the arbitration of President Wilson (Feb. 11). On March 3, however, Italy, who had steadily refused to recognize the accomplished fact of Yugoslav unity and insisted on the Conference only admitting the Yugoslavs as a "Serbian" delegation, declined American arbitration and threatened to withdraw altogether from Paris unless their territorial demands were conceded. This in turn strengthened the hands of the extreme section among the Yugoslavs, who now advanced the full ethnographic claim, involving Trieste and Gorizia as well as Dalmatia and Istria, and at the same time increased their demands against Bulgaria, Austria and Albania. Nor was it very easy for the Serbs and Croats to show moderation toward Italy, without appearing to desert the Slovenes, at whose expense, for obvious geographical reasons, the main amputations must inevitably take place. The bad impression made by the claims now submitted to the Supreme Council was only partially removed by a speech of Trumbić and by his proposal to leave the settlement of frontiers to a plebiscite (April 16). This offer was made in the knowledge that the memorandum addressed by President Wilson two days previously to Orlando and Sonnino had met with rejection, and was indeed well calculated to heighten the contrast between the outlook of the two rival nations toward Wilsonian principles. The American note reaffirmed these principles as the accepted basis of armistice and peace, and insisted on applying the same methods toward Austria-Hungary as Germany. It accepted the Brenner as a fair strategic line on the north, but argued that the Treaty of London was no longer applicable in respect of Italy's eastern frontier, since the line which it traced was designed to secure Italy against future Austro-Hungarian aggression, and Austria-Hungary had by now ceased to exist. It then defined what came to be known as "the Wilson Line," which assigned to Italy Gorizia, Trieste and Istria west of the river Arsa, but not Fiume, which must become an international port, nor any points south of it, save perhaps Lissa and Valona: it also advocated the dismantling of the whole eastern Adriatic coast. On April 23 President Wilson followed up this private memorandum by a public manifesto to the Italian nation, in which he repudiated the Pact of London and appealed for the application of the same principles on the Adriatic as those enforced against Germany. Fiume, he declared, must be the outlet, not of Italy, but "of Hungary, Bohemia, Rumania and Yugoslavia." Unhappily, despite its warm assurances of American friendship, this document met with a most hostile reception in Italy, where it was interpreted as an attempt to undermine the position of her spokesmen and so mete out to her a different measure from that prescribed by France and Britain. Thus the proposal entirely failed of its effect, and as Italy, Yugoslavia and America each adhered to its standpoint, and the two western Powers shrank from any constructive policy, a fresh deadlock ensued. At the end of May, however, M. Tardieu suggested a compromise by which the port and district of Fiume with most of eastern Istria and a total population of over 200,000 (mainly Yugoslavs) would form a small buffer state between Italy and Yugoslavia, under the guarantee of the League of Nations. President Wilson adhered to his own scheme, but made it clear that he would not oppose any direct agreement, whatever might be its terms: while the Yugoslavs, though accepting the idea of a buffer state, insisted upon their enjoying at Fiume a status analogous to that of Poland at Danzig, and added the impossible condition of a plebiscite after three years. During the final stages of the German treaty the Adriatic problem was once more shelved, until on June 29 and July 6 armed conflicts took place in the streets of Fiume between Italian and French soldiers, resulting in several deaths. A commission of inquiry was then at last appointed by the Allies, and ordered elections under inter-Allied control and the dissolution of the terrorist "League of Volunteers." But on Sept. 12, the very day on which American and British police were to be installed, D'Annunzio and his Arditi occupied the town, with the open connivance of the Italian naval and military authorities though to the embarrassment of the Roman Cabinet. The Allies, so far from attempting to restore order, withdrew their forces and allowed their authority to be flouted. The fresh deadlock that ensued was by no means distasteful to Rome, which drew encouragement from Wilson's increasing impotence at home and therefore played for time. At last on Dec. 9 1919 the Supreme Council (Clemenceau, Polk and Crowe) addressed a memorandum to Italy, outlining new terms of settlement—viz. the Wilson line (modified so as to leave Albona in Italy), a demilitarized buffer state, a special *régime* for Zara, cession of Pelagosa, Lissa and Lussin to Italy: Valona in full sovereignty, and an Italian mandate in Albania, under the League of Nations. The Italian claim of territorial continuity with Fiume was definitely rejected. Italy in her reply (Dec. 10) insisted on continuity (the real if unavowed motive of which was to control the port of Fiume in the interests of Trieste and Venice, and so retain some hold over Yugoslavia's commercial development), demanded the island of Cherso and the neutralization of the Yugoslav coast, and suggested a triple division—the *corpus separatum* of Fiume to Italy, the port to the League of Nations, and the rest of the buffer state to Yugoslavia. On Jan. 6 1920 Nitti, meeting with no response, wrote to Lloyd George to demand the execution of the Pact of London. At this stage the Yugoslav delegation committed a grave tactical blunder, Trumbić's views being overridden by the Balkan imperialistic aims of Pašić. While pleading for a plebiscite against Italy and doing lip service to an independent Albania within the frontiers of 1913, it added that in the event of any revision of those frontiers Yugoslavia would claim Skutari and all territory north of the river Drin (Drim). The sole justification for such a claim lay in the terms of the Treaty of London, which the Yugoslavs could not adopt as a basis without stultifying their whole position against Italy. But Italy, in her next memorandum to the Conference (Jan. 9) thus found it easier to reaffirm the validity of the treaty, while arguing that as it had envisaged the creation of three separate states (Serbia, Montenegro and Croatia) rather than of a big Yugoslavia, the clause regarding Fiume could no longer be upheld. On Jan. 13 Clemenceau and Lloyd George addressed new proposals to the Yugoslavs, in the form of a scarcely veiled ultimatum. The buffer state was now abandoned, the *corpus separatum* (with territorial continuity) falling to Italy, Sušak to Yugoslavia and the port of Fiume to the League of Nations: Italy was also to receive Lussin, Lissa and the Albanian mandate, while Zara was to be independent under the League. In originating this impromptu scheme, Lloyd George was influenced by secret indications that the Serbian reactionaries, if promised Skutari in return for Fiume, might throw over Trumbić and abandon the Wilson Line and American principles generally. As however Trumbić rallied the Yugoslav delegation to refuse the Franco-British project, Clemenceau the very next day introduced the important modification that Fiume should be an independent state under the League. When the Yugoslavs placed various conditions upon their acceptance, they were bluntly informed that unless they accepted within four days, France and Britain would authorize the literal execution of the Treaty of London, thus leaving Fiume to Yugoslavia, but all northern Dalmatia in Italian hands (Jan. 20). But this ultimatum was rendered invalid by a wire from Lansing, protesting against any settlement without the participation of America. Paris and London having assured Washington that neither concealment nor lack of courtesy was intended, Belgrade found it quite safe to reject the note of Jan. 20, which it pointedly described as "a friendly proposal, not as an injunction." It further expressed its inability to believe that the Powers wished to impose "a treaty concluded unknown to it by third parties, and whose clauses have never been communicated to it." (Jan. 28.) This incident led President Wilson to address to the Allied Cabinets a series of three notes (Feb. 10 and 25 and March 6) which will remain the classic documents of the controversy, and reduced his opponents to silence, though not to surrender.

After their passage the Adriatic question was again allowed to stagnate, the Powers resuming their negative attitude, while advocating direct discussion between the two parties. At last on April 25 Trumbić, having obtained the special sanction of the Belgrade Cabinet, informed Nitti of his readiness to negotiate, and a meeting between the two statesmen did actually take place at Pallanza on May 11: the commercial experts had already reached agreement. But the prospect of a settlement roused the Italian Nationalists to a final effort: the Nitti Cabinet fell, and D'Annunzio, repeating his defiance of Europe, attempted a further raid upon Dalmatia. The continued presence of American warships on the Dalmatian coast alone prevented a series of brawls between Italian sailors and the Croat population from developing into open warfare. Fortunately the new Giolitti and Vesnić Cabinets showed equal moderation and skill in restraining the hotheads on both sides, and the new Foreign Minister, Count Sforza, was assisted by a personal knowledge of Serbian and Balkan problems all too rare among western statesmen. It was not however till the autumn that direct negotiations could be resumed, and by that time the eclipse of President Wilson placed Italy at an advantage. By the Treaty of Rapallo (Nov. 12 1920) Italy acquired a frontier considerably farther east than the Wilson Line, and including the quicksilver mines of Istria, the watershed of the Julian Alps as far as Snježnik (*Monte Nevoso*), almost all Istria with Abbazia and Volosca, and a narrow strip of shore connecting it with Fiume. The *corpus separatum* became an independent unit under the League of Nations, the Croat suburb of Sušak remaining in Yugoslavia and the Baros port being added as an outlet for Yugoslav trade. Zara became a free city under Italian sovereignty, but as a tiny isthmus without hinterland or islands. Italy renounced all claims to Dalmatia, and of the islands retained only Lussin and Cherso. Special linguistic and other privileges were assured to the Italian minority in the Dalmatian towns, but no corresponding charter was granted to the four to five hundred thousand Slovenes and Croats annexed to Italy. The settlement, though far from ideal, involved concessions on both sides: and Italy, though still forgetful of the principles enunciated at the Roman congress, could at least claim to be the only victorious Power which had relinquished its hold upon conquered territory. One practical result of the treaty was that Italy tacitly abandoned the cause of King Nicholas and accepted as inevitable Montenegro's incorporation in Yugoslavia.

The New Frontiers.—The consolidation of the new State was seriously delayed by the prolonged dispute with Italy and by the fact that for nearly two years after the Armistice the danger of an armed conflict could not be overlooked. But in five other directions also the frontiers were unregulated. (1). By the Armistice concluded at Belgrade on Nov. 12 1918 the Serbs were allowed to occupy Temesvár and most of the Banat, the east of which is overwhelmingly Rumanian and which was claimed in its entirety by Rumania, in right of her treaty of Aug. 1916 with the Allies. At the Paris Conference Rumania's enforced conclusion of peace with Germany was treated as absolving the Allies from obligations which were admitted in the parallel case of the Italian treaty: and the necessity of a partition on mainly ethnographic lines was from the first admitted. The special commission, after hearing the views of Trumbić and Bratianu, recommended a line which as nearly as possible balanced the Serb and Rumanian minorities left to Rumania and Yugoslavia respectively, and secured to the latter the essentially Serb districts of Torontál county: but at the instance of the French this line was modified to include Vršac (Versecz) and Bela Crkva (Weisskirchen) in Yugoslavia. This has the disadvantage that while the Serbs are stronger than any other single race in the two towns, their cession involved the loss of many purely Rumanian villages by Rumania, and also her loss of the important railway line connecting Temesvár southward with the Danube. (2). The regulation of the new Yugoslav frontier with Austria proved very thorny. Thanks to the efforts of Trumbić and the Slovene experts in Paris, Marburg (Maribor), a town with a German majority but surrounded by a purely Slovene district, was assigned to Yugoslavia: but under the Treaty of St. Germain a roughly triangular district north of the Karawanken range was referred to a popular plebiscite. The Inter-Allied Commission entrusted with the details was ordered to divide the disputed area into Zone A, mainly south of the river Drava (Drau) and Zone B, consisting of Klagenfurt and its basin, and to hold the plebiscite in the latter, only in the event of Zone A voting for Yugoslavia. After a keen contest between the rival Slovene and Pan-German propagandists, voting took place in Oct. 1920, and resulted in a majority of 12,747 for Austria. The fact that many Slovenes voted against Yugoslavia was largely due to a desire to escape from all military service. Zone B, with Klagenfurt, now automatically passed to Austria. (3). Against Bulgaria the Yugoslav delegation claimed considerable frontier rectifications—(*a*) the Strumnica salient, which threatened the Vardar railway from the east, (*b*) the district of Kochana (Tocana) and the Bregalnitsa (Bregalnica), (*c*) a strip of territory running parallel with the old Serbo-Bulgarian frontier the whole way from Zaječar to Kyustendil, and (*d*) the town of Vidin on the Danube and the salient between it and the Timok. These claims were regarded by the Peace Conference as excessive, and under the Treaty of Neuilly only the two first were allowed, though in place of the third the town and district of Tsaribrod were assigned to Yugoslavia, and thereby the main strategic key to Sofia. This decision is so patently unjust that it has been very widely ascribed to a deliberate design to keep the two countries apart. (4). The Pan-Serb section of opinion in Belgrade, encouraged in this instance by some of the army chiefs for strategic reasons, has always coveted northern Albania: and the Montenegrin Unionists, led by Radović, made every effort to secure the adoption of their full claim by the Yugoslav delegation. This was opposed by Trumbić and all the more progressive elements in the new State, who realized that the claim to Skutari knocked the bottom out of the whole Yugoslav case against Italy and Austria. Thus the advocates of an unscrupulous "deal" on the lines of "Skutari for Fiume" failed to assert themselves, and Yugoslavia pronounced in favour of an independent Albania, merely reserving her right to share the spoils if it came to a general partition. After Giolitti's renunciation of a mandate in Albania the claim to Skutari became untenable, and at last in 1921 the Supreme Council sanctioned the frontiers assigned to Albania in 1913. Yugoslavia's relations with Albania, though simplified by this decision, have been affected by the Albanian counterclaim to Peć, Djakovo and the plain of Kosovo, where since the middle of last century the Albanian element had grown steadily stronger at the expense of the Serbs. The murder of Essad Pasha (June 1920) deprived the Serbs of their chief supporter in Albania: and friction was increased by the bad administration in the Sanjak and Macedonia, by the inability of the Durazzo Government to prevent continual armed raids against Serbian territory, and by the encouragement given from some Serbian quarters to the Mirdite rising in the summer of 1921. (5). The frontier with Hungary was the last to be regulated. The Treaty of Trianon satisfied the most essential claims of Yugoslavia, by dividing the whole Banat (save a small Magyar triangle opposite the city of Szeged) between her and Rumania, and by assigning to her the whole Bačka (except Baja and district), part of the Baranya (forming the angle between Drave and Danube) and the Medjumurje (between Drava and Mur). Thus, in order to secure the town of Subotica (Szabadka) with its large Bunjevac (or Catholic Serb) population, she was allowed to annex not less than 250,000 Magyars. Her claim to Pécs (Fünfkirchen) was disallowed, but owing to the long delay in ratifying the treaty, Yugoslav troops remained in occupation of this district and its valuable coal-mines till Aug. 1921, when at the instance of the Supreme Council it was handed over to Hungary. Meanwhile Pécs had become a centre of the exiled Magyar progressives, who preferred a provisional Yugoslav *régime* to the white terror of Adml. Horthy. On the eve of evacuation an attempt was made in Pécs to reëstablish the Hungarian Republic under Count Károlyi, but owing to the communist views of some of its promoters the Belgrade Government withheld all support, and the movement promptly collapsed.

Internal Politics.—So long as vital frontier disputes were unregulated, the central Government in Belgrade held that elections could not be held, and governed for the first two years through a provisional Parliament, for which no one could claim a really representative character. The deputies for Serbia held mandates which had actually expired as long ago as June 1914, but whose renewal war and invasion had effectually prevented: those for Croatia had been elected in Jan. 1914, those for Montenegro were delegated by the revolutionary assembly of Podgorica in Nov. 1918. But in Bosnia and most of the other provinces the deputies had no popular mandate whatever, beyond being members of the self-constituted local committees which had sprung up amid the ferment of the revolution. Meanwhile the union of so many distinct political organisms had reduced the party system to chaos, and the first two years were taken up by a process of regrouping, the dominant issue being Centralism versus Federalism. In accordance with the Declaration of Corfu, the decision regarding the actual form of the State was left to a constituent assembly: but as the machinery of Belgrade was naturally quite inadequate to the task of administering a country three times the size of the Serbia of 1914, the provincial Governments of Croatia (with the Ban at its head), Slovenia, Dalmatia and Bosnia continued to function, though the local diets were no longer summoned.

During 1919 internal politics centred in a struggle between the Radicals, who still possessed the best party machine and stood for a narrowly Serbian as opposed to a Yugoslav programme, and the newly constituted Democratic party, which absorbed most of the Serbian Opposition parties, the old Serbo-Croat coalition of Zagreb, and the Slovene Liberals. The Radicals of Serbia being conservative in all but name, made a working alliance with the clericals of Zagreb and Ljubljana, and under the leadership of Protić favoured decentralization, combined with concessions to the expropriated landowners. But in the land question the Radical party was paralyzed by its Bosnian wing, which sided with the peasantry: and thus in Sept. Protić was replaced by Davidović, the Democrat leader, and though the Government remained a coalition, its weight was transferred farther to the Left. An internal trial of strength continued throughout the winter between the rival governmental groups, until in May 1920 a breach was only averted by a reconstruction of the Cabinet under Vesnić, who as Serbian minister in Paris since 1904 enjoyed wide prestige, and though a Radical, stood aloof from party dissensions. Under his weaker but more neutral guidance, and aided by the unifying force of the Adriatic crisis, the parties reached agreement upon a new parliamentary franchise, based on universal suffrage. Though otherwise progressive, this law committed the injustice of temporarily disfranchising the non-Yugoslav minorities, on the convenient pretext that they could not claim the vote until the expiry of the two years during which the Treaty of Trianon secures their right to choose citizenship in a neighbouring State. This law was the last serious act of the provisional Parliament, which had shown itself singularly barren in legislation, and contrasts most unfavourably with the first assemblies of all the other "Succession States."

The elections to the Constituent Assembly (Nov. 1920) did not clear up the situation as had been expected. No party secured an absolute majority, and the two strongest, the Radicals and Democrats, being almost exactly balanced, were forced to strengthen still further their unnatural alliance. In open opposition stood (1) Stephen Radić, the Croat peasant leader whom the Democrats had unwisely imprisoned in 1919–20, and who now swept the boards in Croatia with a Republican and Federalist programme and induced his party of 50 to absent itself from the Constituent: (2) the Croat and Slovene clericals, who strongly opposed centralization, and (3) the 58 Communists, led by a small group of extreme theorists, but owing their strength to the subversive elements in the Bačka, Macedonia and Montenegro and the secret aid of the Carlists in Vienna and Budapest. As the coalition lacked the necessary majority, it was reduced to gathering support piecemeal among the more neutral groups: and for this task Pašić, who became Premier in Jan. 1921, was specially qualified. By the promise of 100 million dinars to the expropriated Begs, he won over the Moslems of Bosnia, and by similar methods he detached the Slovene section of the newly founded Agricultural party (Zemljoradnici). But though he was thus able to carry the first reading of the new constitution by 227 to 93 votes, he was faced by the passive resistance of the great majority of Croats and Slovenes, who regarded with suspicion his "Great Serbian" and centralizing aims. It is significant that Protić, hitherto Pašić's most intimate associate, withdrew from the Radical party and from Parliament rather than sanction a constitution so inimical to provincial interests: while Trumbić, the foremost advocate of full national unity, recorded his vote against it. In many quarters it was openly accepted on the ground that any constitution was better than none, and that further delays and discussions would arrest the new State's development and discredit it abroad: but the settlement could not be regarded as definitive. On June 28 (Kosovo Day) the Prince Regent took oath to the new constitution, but the ceremony was marred by an attempt to assassinate him and the premier, by a bomb thrown as they drove back to the palace. This outrage, which was traced to the Communists, provided fresh proof that the Democratic leader Drašković, as Minister of the Interior, was justified in his charges of widespread terrorist conspiracy and even in the much debated Decrees (Obznane) by which he sought to combat them. When then on July 21 Drašković was murdered by a young Bosnian Communist, Parliament resolved on reprisals, and 10 days later passed by 190 to 54 laws of extraordinary severity for "the Defence of the State," terrorist agitation being made punishable by death, prolonged penal servitude or heavy fines. The mandates of the 58 Communist deputies were annulled, and eight arrested as privy to the attempt on the Regent. No less an authority than the ex-premier Protić publicly challenged the constitutional validity of such action.

Despite acute party dissensions and bad administration the new State was in 1921 steadily consolidating itself. Separatism was non-existent, for the cogent reason that there was no point toward which a new irredenta could gravitate: the Habsburg cause had no adherents, save a few discredited traitors who congregated in Graz and Vienna: and communism, which was quite alien to an agrarian and peasant-owned State, owed its passing success to the aftermath of war and the blunders of the middle class rather than to its own attractions. There was general agreement on foreign policy, whose pivots were close alliance with Czechoslovakia, the series of bilateral agreements which made up the Little Entente (Czechoslovakia and Yugoslavia Aug. 14 1920: Czechoslovakia and Rumania April 23 1921: Yugoslavia and Rumania June 7 1921), and the anti-Habsburg agreement concluded with Italy simultaneously with the Treaty of Rapallo (Nov. 12 1920). Yugoslavia's economic recovery had been surprisingly rapid, and the chief problems which confronted her in the autumn of 1921 were how best to exploit her vast undeveloped mineral and agricultural resources, improve her very faulty communications, and root out the illiteracy which was a legacy of alien rule.

YUKON TERRITORY (*see* 28.945 and 15.847).—Although at one time the pop. of the Canadian province reached 30,000 to 35,000 the decline of the mining industry had reduced it to about 5,000 in 1921. Since the establishment of government in Yukon the administration of justice has been in the hands of the North-West Mounted Police, whose services in preserving law and order have been invaluable.

In the northern portion of the territory the ground below the surface remains frozen throughout the year, but from June to Oct. the climate is warm and sunny and vegetation grows freely in the valleys. Wild fruits such as bilberry, bearberry, crowberry, bog apple, currant, raspberry, foxberry and high-bush cranberry occur, besides numerous species of phanerogams. The Yukon is not an agricultural country, but oats, barley, rye, flax, potatoes, turnips and other garden vegetables are successfully raised. Parts of the territory are wooded with fair sized timber. White and black spruce are the most important trees, reaching 2,400 ft. above sea level: specimens having 21-in. stumps have been noted but the average diameter ranges from 12 to 16 inches. The timber cut is for home consumption. Poplar (two varieties) and canoe birch are found, also willows, alder, juniper and other shrubs, which form thickets and dense undergrowth.

Moose, caribou and sheep are plentiful in most localities, and black, brown and grizzly bears are numerous. Wolverines, marten, lynx, ermine, rabbits and fox are the chief fur-bearing animals. The commonest birds are the Alaska jay, Swainson hawk, northern varied thrush, fox sparrow, grey checked thrush, and there are Hutchin geese, partridge, ptarmigan and ducks of many varieties. The waters of the Yukon are well stocked with fish, especially salmon, whitefish, trout, pickerel and pike.

The old primitive methods of extracting gold have been replaced by dredging and modern hydraulic methods. In 1920 the production of gold from the Yukon territory was 72,140 oz., against 90,705 oz. in 1919. This was obtained almost wholly from the alluvial sands and from the gold ores of the Conrad district. There has been a gradual falling off in production since 1913, when about 283,000 oz. worth $6,000,000 were mined. It was estimated in 1920 that the total output of gold had been over $150,000,000. Coal, copper, silver and other ores are mined and discoveries of silver ores at Kerro Hill have been reported.

The mountain system of the Yukon is the most remarkable in Canada, not only in regard to height and extent of glaciers, but also in scenic grandeur, majesty and imposing nature. It contains Mt. St. Elias, just within Canadian territory as delimited by the joint commission of boundary surveyors (17,978 ft.), and Mt. Logan within 20 m. of it (19,539 ft.). These, along with Mt. McKinley in Alaska, are the highest peaks on the North American continent. (W. L. G.*)

ZAGLUL, SAAD (*c.* 1860–), Egyptian pasha, was the son of a notable in the district of Ibian, Gharbia Province. He was educated at the village school and afterwards at the university of El Azhar, in Cairo. When he had completed his prescribed course of studies, he was, in 1880, appointed editor of the *Official Journal.* Later he was nominated a Moawin under the Ministry of the Interior and eventually became Chief of the Contencieux for the province of Giza. Involved in the Arabi revolt, he was one of the many notables detained on the occupation of Egypt by British troops in 1882. On his release he ceased to hold office and in 1884, when the native tribunals were instituted, he began to practise at the bar. In 1892 he was appointed counsellor of the native court of appeal. Having become proficient in the French language and in the science of law, he obtained his diploma in law. He became Minister of Education in 1906, and under his "enlightened administration" it was said by Lord Cromer (*Modern Egypt,* vol. ii., p. 535) that "education in Egypt made rapid strides in advance." A change of the Ministry during Lord Kitchener's tenure of the Cairo Agency resulted in Zaglul's ceasing to hold the portfolio for Education, but he was appointed vice-president of the Legislative Assembly and he took a special interest in its deliberations until the outbreak of the World War, when the sittings of that body were temporarily suspended.

On the signing of the Armistice Zaglul, who had for long been considered the principal spokesman of the Nationalist party, appealed to the Residency in Cairo for the recognition of Egyptian independence, basing his demand on President Wilson's self-determination policy to which effect had been given by the British Government's issue of a Proclamation defining the status of the other countries liberated from Turkish rule by the war. When his proposal that he and some representative Nationalists should visit London to press their views was refused by the Government, he became discontented, and his attitude was so hostile that he and three others were arrested and deported to Malta. This was the signal for a murderous outbreak in Egypt in which British officers and others were killed, and the country became much disturbed. Zaglul and his friends were later released, and freedom of travel, which war measures had hitherto restricted, was permitted to all. A special Mission under the chairmanship of Visct. Milner was sent to Egypt in Nov. 1919 to enquire into matters and make representations. Zaglul eventually came to London and discussions between him, Adly Pasha and Lord Milner took place, the results of which were published in the "Milner Report." Zaglul returned to Egypt early in 1921, where he represented the extreme Nationalist party in opposition to the more moderate ministry under the presidency of Adly Pasha. At the end of the year, when trouble again broke out in Egypt, Zaglul was arrested once more and deported to Ceylon.

ZANGWILL, ISRAEL (1864–), English man of letters (*see* 28.956*), subsequently to 1909 published various volumes of essays, *Italian Phantasies* (1910), *The War for the World* (1916), *The Principles of Nationalities* (1918) and *The Voice of Jerusalem* (1920); and a novel, *Jinny the Carrier* (1919). In drama he produced *The War God* (1911, acted at His Majesty's theatre, London), *The Next Religion* (1912, London Pavilion), *Plaster Saints* (1914, Comedy theatre), and *Too Much Money* (1918, Ambassadors theatre). He took an active part as a speaker on behalf of the woman suffrage movement, and also as a pacifist during the World War. His attempts, as founder of the Jewish Territorial Organization, in connexion with the Zionist movement, to combine all the Jewish organizations in a scheme for the acquisition of the highlands of Angola as the "Jewish national home" had proved abortive before the outbreak of the World War; and subsequently, when the British Government gave its support to the setting apart of Palestine for this object, Mr. Zangwill and the J. T. O. declined to work with the Zionists on this basis. The J.T.O., however, organized an Emigration Regulation department for deflecting the stream of Jewish emigration from the Ghetto of New York to the southern states of the American Union, west of the Mississippi, a fund being established for this purpose, to which Mr. Jacob Schiff contributed £100,000, the firm of Rothschild £10,000, Baron Edmund de Rothschild £10,000, and M. Brodsky, of Kiev, £10,000.

ZANZIBAR (*see* 28.958).—The pop. of the protectorate was estimated in 1920 at 198,000; that of Zanzibar I. at 115,000 and that of Pemba at 83,000. Zanzibar city had some 36,000 inhabitants. The Arab aristocracy—large landowners—numbered about 10,000; there was an equal number of British Indians and about 300 Europeans, the British colony being the largest.

The transshipment of goods to and from the mainland of E. Africa and the growing of cloves are the chief sources of wealth. In 1919 it was estimated that some 60,000 ac. were under cloves, with about 5,500,000 trees in bearing. The average output 1910–20 was about 14,000,000 lb. Next to cloves comes the cultivation of the coco-nut palm for copra, there being in 1919 about 2,500,000 trees in the islands. In 1911 the clove crop was worth £436,000, in 1913 £412,000, and in 1918 £595,000. Copra exports in 1911 were valued at £203,000, in 1913 at £216,000, and in 1918 at £151,000 (having been worth £299,000 in 1917).

Apart from cloves and copra most of the exports figure also as imports, being goods in transit. Zanzibar, however, suffered to a considerable extent by the extension of direct steamship communication between Europe and India and the mainland of E. Africa, goods formerly transshipped at Zanzibar being taken direct to or from Mombasa, Tanga and Dar es Salaam. But if Zanzibar ceased to serve as a gigantic go-down or storehouse for the whole coast, it retained its position as the chief city of E. Africa and remained the headquarters of the principal Indian merchants trading with E. Africa. It also retained the dhow traffic, being visited yearly by hundreds of boats from the coast of Arabia and the Persian Gulf. The construction of a concrete wharf 1,300 ft. long, with a minimum of 30 ft. alongside, in progress in 1920–1, and other harbour improvements made Zanzibar port more accessible to shipping. The gross tonnage of shipping clearing the port in 1910 was 1,087,000; it rose to 1,502,000 in 1913, but fell, largely owing to war conditions, to 547,000 in 1916 and to 378,000 in 1918. It had risen to 582,000 tons in 1919. Imports (including bullion and specie) were valued at £993,000 in 1910, at £1,103,000 in 1913, at £2,366,000 in 1918 and at £1,934,000 in 1919. Exports in 1910 were valued at £1,033,000, in 1913 at £1,048,000, in 1918 at £2,133,000 and in 1919 at £2,444,000. The bulk of the trade is with India, England and E. Africa.

Revenue rose from £204,000 in 1910 to £407,000 in 1919; in the same period expenditure increased from £189,000 to £323,000. More than half the revenue is derived from customs. There was a public debt at the end of 1919 of £100,000.

History.—Sayyid Ali bin Hamud, the Sultan, a young man who had been educated at Harrow, who kept his court on European models and was fond of travel, abdicated in 1911 while on a visit to Europe. He died in Paris in Dec. 1918. Ali was succeeded by his brother-in-law Sayyid Khalifa ben Harud, a great nephew of Sultan Bargash. Khalifa, born at Muscat, Aug. 27 1879, had attended the coronation of George V. and was proclaimed Sultan on his return from London, Dec. 1911. He proved whole-heartedly loyal to the British, and his moderating influence did much to steady Moslem opinion in E. Central Africa during the war.

In July 1913 the control of the protectorate was transferred from the Foreign to the Colonial Office. Mr. Edward Clarke, the British Agent since 1909, had died at Zanzibar in the previous Feb. Under the Colonial Office the governor of British E. Africa (Kenya Colony) was appointed High Commissioner of Zanzibar, the local administration being in the hands of a British Resident, to which office Maj. F. B. Pearce was appointed in 1914. The Resident also took over the functions of first minister, a post which had been filled by Capt. F. R. Barton. The Sultan became president of the Protectorate Council, on which three Arab notables sat as unofficial members. The council has advisory powers only, but decrees of the Sultan are binding when countersigned by the British Resident.

During the war Zanzibar served as a base for the British naval squadron. On Sept. 20 1914, while the ancient cruiser

"Pegasus" was at anchor in the roadstead, undergoing repairs, it was sunk by the German cruiser "Königsberg," losing 25 killed and 80 wounded out of a crew of 240. The "Königsberg" also sank the guard ships "Cupid" and "Khalifa"—thus destroying the Zanzibar navy. About 5,000 Zanzibari served as carriers in the E. African campaign and the inhabitants contributed £70,000 to war funds.

In 1917 Sayyid Khalid, who for a brief period in 1896 had usurped the throne and had then taken refuge in German E. Africa, where he had since remained, surrendered to a British force. He was deported to St. Helena, whence in 1921 he was transferred to the Seychelles.

(F. R. C.)

ZEEBRUGGE.—Among the British naval operations in the World War none created more interest than the attack on the Germans at Zeebrugge and Ostend, on the Belgian coast, in 1918. Ever since the German occupation of the Belgian coast, Zeebrugge had been a source of anxiety to the Dover Patrol. There the German torpedo craft and German submarines lay in a safe base only some 60 m. from the Straits, a danger to the Downs and a constant menace to British transports and trade in the Channel. Vice-Adml. Sir Reginald Bacon had contemplated an attack on it with monitors, but the Admiralty had disapproved, and it was not till the appointment of Rear-Adml. Sir Roger Keyes in Dec. 1917, that preparations were actually begun. The main object of the enterprise was to block the harbours of Zeebrugge and Ostend.

The actual harbour of Zeebrugge is small and is formed by a long curved mole on the western side, whose assault was an important part of the operation. This mole was 1½ m. long, connected with the shore by a viaduct built on steel pillars. On the outside the western wall rose 27 ft. 10 in. above high water, with a ledge 2 ft. 9 in. wide running along it about 12 ft. above high water. The parapet on top was some 3 ft. wide with a drop of 4 ft. to a ledge 12 ft. wide which ran 16¾ ft. above the quay. The quay on the harbour side was 27 ft. wide, equipped in the usual way with cranes and three large sheds and shelters. At the outer end was a battery of 3 5·9-in. guns, and a narrower portion ran on to the lighthouse where 6 4-in. guns, were mounted.

The general plan of operations was simple. Three old cruisers, "Iphigenia," "Thetis" and "Intrepid" (all built about 1891), filled with cement, were to enter the harbour and be sunk at the entrance to the ship canal to Bruges. The "Vindictive," supported by two auxiliary vessels "Iris II." and "Daffodil," was to assault the mole on its outer and western side and by creating an impression that this was the main operation, divert the enemy's fire from the blocking ships. As Bruges was accessible by canal from Ostend, Ostend was to be blocked at the same time by the old cruisers "Brilliant" and "Sirius." The main obstacle to the enterprise lay in the powerful batteries. On the 40 m. of coast-line there were mounted 153 guns, including 6 15-in., 4 12-in., 33 11-in., 1 9·4-in., 23 8·2-in., 73 5·9-in., 6 5-in., 11 4·7-in., and 52 4-in. The coast positively bristled with guns. Only 3 m. E. of the Zeebrugge canal stood the Kaiser Wilhelm II. battery (known at Dover as the Knocke) armed with 4 12-in. with a range of 41,000 yd. One and a quarter m. W. of Ostend was the Tirpitz battery with 4 11-in. ranging 35,000 yd., and 3 m. E. of the town was the Deutschland (old Jacobynessen) equipped with 4 15-in. ranging 43,500 yards.

The approach to the entrance of the ship canal at Zeebrugge was under the fire of the Goeben battery of 4 8·2-in. guns at 1,000 yd., and the chance of success depended largely on an effective smoke screen.

The attack on the mole was to be made by the "Vindictive" (Capt. Alfred B. Carpenter), an old cruiser of 5,750 tons, 320 ft. long, 24 ft. draught specially fitted for the occasion, assisted by the "Iris II." (Comm. Valentine Gibbs) and "Daffodil" (Lt. Harold G. Campbell), two Liverpool ferry boats of large capacity and light draught. The viaduct of the mole was to be blown up by two submarines, C1 (Lt. Aubrey Newbold) and C3 (Lt. Richard D. Sandford). A strong body of 15 destroyers was attached to the Zeebrugge force under Capt. Wilfred Tomkinson ("Phoebe," "North Star," "Trident," "Mansfield," "Whirlwind," "Myngs," "Velox," "Morris Moorsom Melpomene," "Tempest" and "Tetrarch" to escort the force and cover it to seaward; "Termagant," "Truculent" and "Manly" to screen the Zeebrugge monitors). A force of 18 coastal motor boats (55 ft. long, 3 ft. draught, 35 knots, 2 18-in. torpedoes) under Lt. Arthur E. Welman accompanied the expedition, of which 8 were allocated for the smoke screen, 5 to support the "Vindictive," and 4 to attack vessels inside the harbour. With them were 33 motor launches under Capt. Ralph Collins for smoke screens, and inshore rescue work. Out to seaward were the two monitors "Erebus" and "Terror" for bombarding the batteries. The Rear Admiral's flag flew in the destroyer "Warwick."

The three old cruisers "Thetis" (Comm. R. S. Sneyd), "Intrepid" (Lt. Stuart Bonham-Carter) and "Iphigenia" (Lt. E. W. Billyard-Leake) were to act as blocking ships. The two latter were of 3,600 tons displacement, 300 ft. long x 43⅔ ft. x 18½ ft., and the "Thetis" was a little smaller (3,400 tons and 17½ ft. draught).

A similar attempt was to be made at Ostend. There the blocking ships were to be the old cruisers "Brilliant" (Comm. A. E. Godsal) and "Sirius" (Lt.-Comm. H. N. Hardy) of 3,600 tons. They were to be supported by five bombarding monitors ("Marshal Soult," "Lord Clive," "Prince Eugene," "General Crawford," M24 and M26) and covered by five British destroyers ("Swift," "Faulknor," "Matchless," "Mastiff" and "Afridi"), with three British destroyers and six French torpedo boats attending on the monitors ("Mentor," "Lightfoot," "Zubian," "Lestin," "Capitaine Mehl," "Francis Garnier," "Roux," "Bouclier"). Eighteen British motor launches under Comm. Hamilton Benn and four French were attached for smoke screen, inshore and rescue work, and the whole force was under Commodore Hubert Lynes.

The object of the attack on the mole at Zeebrugge was first to seize the battery at the seaward end and prevent it firing at the block ships, and then to demolish the structures on it as far as possible. The battery was 250 yd. from the lighthouse, and to facilitate its seizure the "Vindictive" was to berth nearly abreast of it on the outer side of the wall. It was then to be stormed by three companies of bluejackets—A company under Lt.-Comm. Bayan Adams ("Princess Royal"), B under Lt. Arth. G. Chamberlain ("Neptune"), D under Lt.-Comm. G. N. Bradford; all under Lt.-Comm. Arthur Harrison ("Lion").

Some 150 yd. to shoreward of the battery and 400 yd. from the lighthouse there was a "fortified zone" of barbed wire and machine-guns. As this commanded the "Vindictive's" berth and would form a rallying point for reinforcements from landward, it was to be seized by four companies of Royal Marines—A (Chatham) under Maj. Chas. Eagles, B (Portsmouth) Capt. Ed. Bamford, C (Plymouth) Maj. Bernard Weller, and machine-guns under Capt. Chas. B. Conybeare.

The storming parties numbered 50 officers and 980 men of the Royal Navy, drawn chiefly from the Grand Fleet and the Nore, and 32 officers and 718 men of the Royal Marines. The seamen were under Capt. Henry C. Halahan and the marines under Lt.-Col. Bertram Elliot. Preparations began early in the year. The force was segregated in the Swin (Thames) and specially trained in all its various tasks. The blocking ships were stripped of all fittings and filled with rubble and concrete. The "Vindictive" in addition to her 10 6-in. guns was given a special equipment of 2 7·5-in. howitzers (1 ford. and 1 aft), 1 11-in. howitzer (aft), 16 Stokes mortars, flame throwers, 16 Lewis guns, and 4 1½-in. pompoms. The success of the attack depended largely on an effective smoke screen, and Wing-Comm. F. A. Brock and 60 ratings were lent to the Dover command, where a small factory was set up to prepare the materials for it.

The lessons of history were not very favourable to the enterprise. Naval Constructor R. P. Hobson had tried to block

Santiago in 1898. The Japanese had thrice attempted to block Port Arthur in 1904. None of these attempts had been wholly successful. Let us glance for a moment at the conditions under which the attack was to be made. The distance from Dover to Zeebrugge was 63 miles. This meant that the expedition must start in daylight to be off the port by midnight. The night must be dark and the wind on shore.

Twice the force was assembled and twice unfavourable conditions supervened. On the night of April 11–12, it was within 13 m. of its rallying point. Finally the night of April 22–23 was fixed for the attack. The main force started at 4:53 P.M. on Monday, April 22. The bombardment was to begin at 11:20 P.M., simultaneously at Zeebrugge and Ostend. The smoke screen was to start at 11:40 P.M. The "Vindictive" was to reach the mole at midnight. The "Thetis" was to pass the end of the mole 25 minutes later. The last point of departure was at a point called G in lat. 51° 27′ N., long. 2° 50′ E. This and other points on the route were marked by buoys laid after careful triangulation by Capt. H. P. Douglas and Lt.-Comm. Francis E. Haselfoot. It was here, some 12 m. off Zeebrugge and Ostend, that the vessels took up their formation for attack. The "Vindictive," which had been towing the "Iris II." and "Daffodil," cast them off. The "Sirius" and "Brilliant" shaped course for Ostend, the "Thetis" and her companions eased down. The host of small craft dispersed for their various tasks. The night was overcast, with a light wind from the N.E., and a thick column of smoke soon began to roll down the coast, hiding everything.

Plan B

As they approached the shore about 11:40 P.M. a great star shell soared into the sky, which was soon thick with them shining dimly through the eddies of the smoke. They were close to the harbour when a great disappointment overtook them. The wind, which had died away, shifted to the southward, greatly reducing the efficiency of the screen. The searchlights fastened on the vessels. At 11:56 the "Vindictive" emerged out of the smoke into the full glare of their beams. The mole could be seen 300 yd. on the port bow. Capt. Carpenter increased to full speed and approached it at an angle of 45°. A heavy fire was opened on her and she replied with her port 6-in. battery, the upper deck pompoms and the guns in the fore top. The storming parties drawn up ready to rush ashore lost both their leaders at this point. Col. Bertram Elliot, waiting to lead the Royals just abaft the bridge, was struck down by a shell which did fearful execution forward. Capt. H. C. Halahan at the head of the bluejackets amidships was killed by machine-gun fire.

At one minute past midnight, the ship came alongside the mole. It was intended to do this 300 yd. from the lighthouse abreast of the 4-in. battery, but the starboard anchor was hung up with a strong tide sluicing down the mole, and the ship was carried some 700 yd. from the lighthouse or nearly 400 yd. to landward of the intended spot. The port anchor was dropped and bowsed to with only a shackle (75 ft.) out. A further difficulty now arose. The rush of the 3-knot tide between the ship and mole created a heavy swell which threw the ship off the mole; only two of the 18 brows could reach the parapet, and the ship could not be kept into the mole. Swaying upward with the roll of the ship the two foremost brows came down scraping and grinding along the mole. The naval storming parties led by Lt.-Comm. Bryan Adams ran out along them, followed closely by the Royal Marines led by Capt. and Adj. A. R. Chater. As the seamen got to the wall they leapt down and tried to make the mole grapnels fast (for hauling the ship into the mole), but only one was got in place and a heavy roll broke it up.

This was a critical time, and it was four minutes past midnight when the little "Daffodil" came up and pushed the ship bodily into the mole. Two more brows were got into place and the landing parties got ashore. The "Vindictive's" guns had suffered heavily. The marine crew of the foremost 7·5-in. howitzer had all been killed or wounded. A naval crew from one of the 6-in. guns, which took its place, was almost entirely swept away. In the foretop the Royal Marines under Lt. Chas. Rigby had kept up a continuous fire with their pompoms and Lewis guns till two heavy shells got home on it, killing or disabling everyone there except Sergt. Norman Finch, who though severely wounded continued to fight his gun singlehanded till the top was wrecked by another shell. The "Iris II." with the Chatham company of Royal Marines and D company of seamen had suffered even more severely. She had gone alongside the mole about 150 yd. ahead of the "Vindictive." The swell broke up the scaling ladders. Lt. Claude Hawkings ("Erin"), who led the way, made a grapnel fast and was shot down on the mole. Lt.-Comm. G. N. Bradford ("Orion") got to the top of a derrick with a grapnel, leapt on to the mole, secured it and fell back shot into the water. Comm. Val. Gibbs fell, with both legs shot away. The grapnels tore away, and the "Iris II.," slipping her cable, dropped alongside the "Vindictive" to land her men across her. Here she again suffered heavily. A big shell went through the upper deck and burst just where 56 marines were waiting to charge up the gangways, killing 49 and wounding seven. Another shell in the wardroom killed 4 officers and 26 men. The heavy swell made it difficult to get alongside the "Vindictive," and only a few men had got across when the siren sounded the retire.

To return to the landing on the mole. The 400 yd. or so by which the "Vindictive" overran her position had a considerable effect on the plan. The seamen, instead of dropping down on the battery, had to go back to it 400 yd. along the mole. The "fortified zone," instead of being between the "Vindictive" and the shore, was now between the "Vindictive" and the battery on the mole, increasing the difficulty of an assault.

The seamen of A and B companies under Lt.-Comm. B. F. Adams, got ashore, and dropping on to the ledge below the parapet made their way toward the lighthouse. They came to a lookout station which they captured. Here an iron ladder led down on the quay and three of the party went down it. A machine-gun in the fortified zone was firing on them, and Lt.-Comm. Adams advanced towards it for some 40 yd. and after taking up a position returned to collect more men. Lieutenant-Commander Harrison, severely wounded in the head, arrived about this time and took charge. Lieutenant-Commander Adams met Maj. Weller who gave him reinforcements, but by the time he got back Lt.-Comm. Harrison had led a rush along the parapet, where he and several of his men were killed by machine-gun fire. Able seaman Mackenzie's courage here gained him a V.C., and able seaman Evans was seriously wounded and taken prisoner in trying to bring in Lt.-Comm. Harrison's body. D Company was still in the "Iris II.," but the marines were forming up on the mole to make an assault.

They had been busy at first in the other direction. The first platoon to get ashore made to the right toward the shore and silenced a party of snipers near No. 2 shed. Captain Bamford (awarded the V.C.) joined them and they reached and held a point 200 yd. toward the shore. Another party of marines dropping straight to the mole had established a strong point by No. 3 shed close to the "Vindictive." About 12:20 a terrific roar and a great sheet of flame rose high above the din. The viaduct had gone up, and the mole was secure from landward side. Major Weller now received Lt.-Comm. Adams' request for reinforcements and sent a platoon and the remains of another to help him.

They advanced toward the lighthouse and reached the lookout station, where they were held up again by machine-gun fire. Lieutenant-Commander Adams and his men were some 40 or 50 yd. ahead. Nos. 5, 7 and 8 platoons were forming up under Capt. Bamford for an assault on the fortified zone. This was the position when the signal to retire blared out.

The demolition company (C Company of seamen) had got ashore under Lt.-Comm. Dickinson, but the storming parties were too close to permit of the sheds being blown up, and an attempt to blow up the destroyers was beaten back. The danger of the attack from landward had been removed by the destruction of the viaduct. Submarine C1 had parted its tow and did not reach the scene in time. Lieutenant R. D. Sandford (awarded the V.C.) in C3 had sighted the viaduct about half a mile off, and running into the iron piers at 9½ knots had jammed the vessel with its 5½ tons of amatol hard and fast. The fuze was lighted and the crew of six were pushing off in their little motor skiff when the propellor was torn off by fouling the submarine, and they had to take to the oars. A rain of bullets fell close to them, and struck down two oarsmen in succession. They were 300 yd. away when the viaduct went up, scattering huge pieces of iron and concrete around them.

Another bullet struck Lt. Sandford, but just at that moment the picket boat with his brother (Lieut.-Comm. Francis Sandford) came up and took them off. Meanwhile, in the "Vindictive," Capt. Carpenter had seen the block ships go in. The position of the storming party and of the ship was precarious. None of the mole anchors had grappled. The ship was being held into the mole by the "Daffodil," and if she were disabled it was practically certain that the men in the mole would not get back. He decided it was time to retire. His own siren was riddled through and through, but the order was passed to the "Daffodil," and the shriek of its siren rose above the din.

It was 12:50 A.M. The parties came gradually back, the marines retiring in perfect order, bringing their wounded with them. Capt. T. M. Palmer refused to leave the shore while any of his men were there, and joined the ranks of the missing. Wing-Comm. F. A. Brock, too, never returned. He was last seen fighting on the mole.

A hawser was passed from the "Vindictive," and at 1:10 A.M. the "Daffodil" began to pull her bows off the mole. The hawser just held long enough to swing her bows round, and she got clear. The "Iris II." came under a heavy fire as she left the mole. A large shell carried away the port side of the bridge, mortally wounding Comm. V. Gibbs and Maj. Chas. Eagles. Lieutenant Spencer, though seriously wounded, continued to con the ship and got her clear. Three more shells hit the ship and caused heavy casualties in the crowded decks, but Motor Launch 558 (Lt.-Comm. Lionel Chappell, with Capt. Ralph Collins on board) came up, and throwing a smoke screen round her helped her to get away.

To return to the blocking ships. With the "Thetis" leading they had rounded the lighthouse in a storm of shot and shell. The "Thetis" propeller fouled a net laid at the entrance to the harbour and carried it with her. Both engines brought up, and she grounded 300 yd. from the pierhead. She was under heavy fire, and as she appeared to be sinking, the order was given to abandon ship and blow the charges; they detonated and the ship sank. The crew manned the remaining cutter and pulled to ML526 (Lt. Hugh Littleton) which was lying near.

The "Intrepid" astern had come under heavy shrapnel fire from the guns as she approached the mole, but after rounding it escaped their attention. She had 87 officers and men in her instead of 54, as the surplus had contrived to stay on board rather than miss the fight. She ran right into the canal, and Lt. Bonham Carter went full speed ahead with the starboard engine and full speed astern with the port to turn her round. As the ship commenced to make stern way he blew the charges, and the crews got into two cutters which were picked up by the "Whirlwind" and a motor launch. Lt. Bonham Carter with two officers and four petty officers had got on a Carley raft and floated down the canal. ML582 (Lt. Percy T. Dean, awarded the V.C.) had come right into the canal behind the "Iphigenia," and under a heavy fire picked them up and took them off. All the crew except one were saved. In the "Iphigenia," like the "Intrepid," the engine room ratings had avoided being taken off, so as to be present at the fight. She came under shrapnel fire off the mole, and as she rounded it a star shell showed up the "Intrepid" heading for the canal and the "Thetis" aground. Two shells struck the ship on the starboard side. The canal was hidden by smoke. It lifted for a moment, and the captain, seeing he was heading for the western pier, went full speed astern, then ahead with the starboard engine, and with a barge in front of him drove into the canal. There was a gap between the "Intrepid" and the eastern bank; he steered into it, collided with the "Intrepid," rang the gong to signify the imminent blowing of the charges, went astern and then ahead. She grounded on the eastern bank and the charges were fired. The crew left the ship in the only cutter left under fire. ML282 (Lt. Percy T. Dean) was waiting and took the crew on board, and then making the cutter fast to his stem went out of harbour stern first at full speed. Heavy machine-gun fire was concentrated on her; two officers were dangerously wounded and two of the launch's crew of four killed, but she got clear.

The destroyers had been lying off the harbour, and the "Warwick" now picked up four motor launches, including ML282 overloaded and full of wounded with 101 men of the "Iphigenia" and "Intrepid." ML110 (Lt.-Comm. Dawbarn Young) had come under a heavy fire while trying to show the blockships the way in. She was struck by three shells, which killed or wounded half the crew and wrecked the engines. Her captain, hit in three places and mortally wounded, gave orders to the last, but died before reaching Dover. The "Warwick," "Phoebe" and "North Star" had been cruising off the mole to screen the force from torpedo attack. The destroyer "North Star" losing her bearings in the smoke had emerged from the smoke screen and coming under a heavy fire was reduced to a sinking condition. The "Phoebe" (Lt.-Comm. Hubert Gore-Langton) attempted to tow her out, but the hawser was shot away once, and parted another time. She was therefore abandoned and sunk. By 1:30 it was all over and the force was on its way back to Dover. The "Vindictive" in terrible disarray arrived there soon after 8 A.M. on April 23. The "Iris II.," limping behind her, reached home at 2:45 P.M. Her commander had died that morning.

Meanwhile things had gone badly at Ostend. The blocking ships "Brilliant" (Comm. Alfred Godsal) and "Sirius" (Lt.-

Comm. Henry Hardy), escorted by the Harwich destroyers "Tempest" and "Tetrarch," arrived off the coast. The motor launches under Comm. Hamilton Benn were busy laying a smoke screen, supported by the "Faulknor" (flying Commodore Hubert Lyne's broad pendant), "Lightfoot," "Mastiff," "Afridi," "Swift" and "Matchless." The wind was blowing lightly from the N.W., but about 11:50 shifted to the S.W. and blew back the smoke screen. The low clouds and drizzle made visibility difficult, and the Stroom Bank buoy could not be seen at first. Thinking that the ships were perhaps too far to the northward, Comm. Godsal continued on his course for two minutes, when he sighted the Stroom Bank buoy to the N.E. and turned to pass to northward of it. It was not, however, in its normal position (approximately 1 m. W.N.W. of the entrance), but had been shifted about a mile to the eastward. Commander Godsal steered from the buoy for the supposed direction of the harbour. As he looked anxiously out for the pierheads at Ostend, breakers suddenly loomed up on the starboard bow, and before the ship could turn she was ashore. The "Sirius" behind her grounded too. Fire had been opened from shore, and both ships were accordingly blown up where they stranded about a mile east of the piers. ML276 (Lt. Roland Bourke) took off the "Brilliant's" crew, while ML283 (Lt. Keith Hoare) rescued the men from the "Sirius." A second attempt to close Ostend was made on the night of May 9–10 by Comm. Alfred Godsal in the "Vindictive" and Lt.-Comm. Hardy in the "Sappho," an old cruiser of the same class as the "Sirius." This time there was no preliminary bombardment but aircraft were coöperating. Conditions seemed favourable for the attempt. The sea was smooth, the night dark with wind from N.W., but hardly had the ships left Dunkirk when the "Sappho" blew out a manhole joint in her boiler and had to put back.

At 1:30 A.M. the small craft went in to lay the smoke screen. News had previously come in that the Stroom Bank buoy had been removed, and Lt. W. R. Slayter went in a coastal motor boat to place a calcium flare in its old position. By 1:35 the smoke cloud was beginning to come down, and at 1:43 the order was given for the monitors to open fire. A roar of batteries answered from the shore. Two coastal motor boats, CMB24 and 30, dashed ahead and torpedoed the piers. But once again misfortune was to attend the attempt. As the "Vindictive" approached, a thick sea fog rolled up the coast, making it impossible to see anything at over 300 yd. Uncertain as to his position, Comm. Godsal steered to westward and then to eastward, and finally gave orders to CMB23 (Lt. Hon. Cecil Spencer) to light a million-candle flare. Though dimmed by the fog and drizzle, its glare revealed the entrance 200 yd. off. The "Vindictive" steered for it and the guns found her at once. The after control was demolished by a shell which killed everyone in it. The bridge was swept with bullets, and Comm. Godsal ordered everyone inside the conning tower. She was close to the eastern pier when a heavy shell burst close to the conning tower, which must have killed the commander for he was never seen again. Lt. Victor Crutchley took command and tried to turn her up the channel, but she grounded at an angle of about 25° to the pier and lay hard and fast. Engineer Lieutenant Wm. C. Bury blew the charges and she sank. The captain could not be found. ML-254 (Lt. Geoff. Drummond, awarded the V.C.) came alongside under a fierce fire. His lieutenant and deck-hand were killed and he himself wounded in three places, but he managed to embark 39 officers and men, and then backing out of the entrance got clear and just managed to reach the "Warwick." Day was breaking and as the boat was badly damaged she was sunk. ML276 (Lt. Roland Bourke, awarded the V.C.) now returned to the "Vindictive," and after searching and shouting found Lt. Sir John Alleyne and two men, all badly wounded, clinging to a skiff. With three of his own crew killed or wounded Lt. Bourke managed to get out and reach the monitor "Prince Eugene" in safety.

This was the end of an enterprise for which no fewer than nine V.C.s were awarded. Its casualties amounted to a total of 637 killed, wounded and missing.

April 22–23	Killed or died of wounds	Wounded	Missing
Officers	19	29	2
Seamen	56	136	
Marines	93	205	14
"North Star"	21	13	
	189	383	16
May 9–10			
Officers	2	5	2
Men	6	25	9
	197	413	27=637

In judging what was achieved it is necessary to remember that at the end of 1917 and early in 1918 the whole efforts of the navy were directed toward one goal—to counter the submarine. The greatest losses were in the Channel where the Flanders flotilla worked, and the blow they would have received by the blocking of Zeebrugge and Ostend was well worth the risk. It was, however, only partially successful. Ostend, though the width of the entrance was reduced probably to 300 ft., was not closed, and though the ships sunk in Zeebrugge must have caused great inconvenience and delay it may be doubted whether they actually stopped the passage of submarines for more than a month. The entrance was 300 ft. wide; there was still a space of some 60 ft. between the stern of the "Iphigenia" and the pier, and by dredging along the edge and fixing up warping bollards it was made possible to warp submarines in and out at high water. The enterprise had another aspect. The navy chafed at its inactivity and looked eagerly for some outlet where it could get at grips with its enemy. The blocking of Zeebrugge and Ostend offered a good prospect of success and was within a reasonable distance of it. And if it did not wholly succeed, the work of those who took part in it sent a breath of inspiration through the navy and gave all who took part in it a lasting name. (A. C. D.)

ZEPPELIN, COUNT FERDINAND VON (1838–1917), German airship inventor, was born at Constance, Baden, July 8 1838. He was educated for the army and received a commission at the age of 20. He served, as a volunteer, in the Federal army during the American Civil War and whilst in America made his first balloon ascent. Returning to Germany, he saw active service in the Austrian war of 1866 and in the Franco-German War of 1870. In 1891 he retired from the army with the rank of general and thenceforth devoted his energies to the study of aeronautics. In 1900 he built an airship, which rose from the ground and remained in the air for 20 minutes, but was wrecked in landing. In 1906 he made two successful flights at a speed of 30 m. an hour, and in 1907 attained a speed of 36 miles. From that time onwards his airship construction made steady progress, and the success he had achieved was evidenced by the exploits of the Zeppelin airships in the World War. He died at Charlottenburg March 8 1917.

ZHILINSKY, YAKOV (1853–1918), Russian general, was born in 1853. On finishing his course at the Cavalry school in St. Petersburg in 1876 he was given a commission in the Guards cavalry, and in 1883 he was appointed on the general staff. He became in 1899 commander of a dragoon regiment, and in 1900 was promoted to the rank of general. During the Spanish-American War he was one of the foreign military attachés at the American general headquarters. In the Japanese War (1904–5) he was appointed chief of staff of the Viceroy of the Far East, Adml. Alexeyev, and in 1909, when Sukhomlinov became War Minister, Zhilinsky became head of the general staff. At the beginning of 1914 he was appointed to command the troops of the Warsaw military district, and on the declaration of war in 1914 he became commander-in-chief of the north-western front. After the defeat of Aug. and Sept. in eastern Prussia inflicted on his armies (Samsonov's and Rennenkampf's) he was recalled. In 1915 and 1916 he was the military representative of the Russian supreme commander-in-chief at the French headquarters. Zhilinsky was reported killed by the Bolsheviks in 1918.

ZICHY, COUNT EUGEN (1837–1906), Hungarian traveller (*see* 28.979), died in 1906.

ZIEM, FÉLIX FRANÇOIS GEORGE PHILIBERT (1821–1911), French painter (*see* 28.979), died in Paris Nov. 11 1911.

ZIMMERMANN, ARTHUR (1859–), the German Foreign Secretary who, during the World War, conceived the idea of trying to inveigle Mexico into an alliance against the United States, was born May 8 1859 at Frankenstein. After having been vice-consul at Shanghai and acting consul in 1900 at Tientsin, he entered the Foreign Office in 1902 in a subordinate capacity and rose by 1910 to be director of the Political Section. In 1911 he was appointed under-secretary and in Nov. 1916 Secretary of State in succession to von Jagow. In this capacity he addressed to America the note of Jan. 31 1917 on the subject of U-boat warfare. He was also the author of the extraordinary invitation of Jan. 19 1917 to Mexico to enter into an alliance with Germany and to sound Japan as to her willingness to coöperate. For Mexico the price of this alliance was to be the American States of New Mexico, Texas and Arizona. This proposal, which was sent through the medium of the German minister to Mexico, von Eckhardt, was intercepted in America, and President Wilson was in a position to publish it on March 1 1917. With other disclosures regarding German machinations against the United States it materially contributed to rouse American national feeling, which found expression in the decisive votes of the Senate and the House of Representatives on April 5 in favour of declaring war upon Germany. Zimmermann retired on Aug. 5 1917 shortly after the resignation of Bethmann Hollweg. The German Liberals and the governmental Socialists had withdrawn their support from Bethmann Hollweg's Government at the time of the so-called "Peace Resolution" (July 19 1917), largely on the ground that it was inconceivable that the Allies and America should ever negotiate with politicians like Zimmermann and Bethmann, who had been guilty of the note to Mexico and other treacherous proceedings.

ZINOVIEV, GRIGORI [OVSEI GERSHON ARONOR] (1883–), Russian revolutionary politician, was born at Novomirgorod in 1883. He was of Jewish origin and his original name was Aronor, but he was known in early life under the names of Apfelbaum or Radomyslovsky and later adopted several designations, such as Shatski, Grigoriev, Grigori and Zinoviev, by the two last of which he is most frequently called. For many years he was an active member of the Russian Social Democratic Labour party, and attended the London Conference in 1907. The next year he was arrested on a charge of participating in the work of the printing press *Rabotnik*, sentenced to a term of solitary confinement in St. Petersburg and forbidden to reside there in future. He then made his way abroad, and in 1909 was editing the *Social Democrat*, the party's main organ. He was present at the party meeting of Nov. 1915, when a split occurred amongst the Russian Social Democratic members of the Duma, and earlier in that year had attended the Zimmerwald meeting at Berne, consisting mainly of Lenin's group, where arrangements were made to get copies of the *Social Democrat* secretly into Russia and to keep in close touch with Karl Liebknecht and Rosa Luxemburg in Germany so as to ensure the distribution of Lenin's literature to Russian prisoners of war.

After the Revolution Zinoviev returned to Russia and became a prominent member of the Petrograd Soviet, of which he became president after the murder of Uritsky in 1918. In the summer of 1917 the paper *Den* published revelations showing that he had been formerly employed by the department of police, and this statement was not refuted.

Zinoviev became a member of the Petrograd Committee and of the Central Committee of the Russian Communist party, and was first president of the Third (Communist) International. He was also president of the Petrograd Extraordinary Commission for combating counter-revolution, speculation and sabotage, and he occupied the position of president of the Soviet Government in Petrograd.

ZIONISM (*see* 28.986).—The part played by anti-Semitism in the growth of the Zionist movement has often been exaggerated. Zionism is a natural, indeed an inevitable, outcome of the instinct of self-preservation, which is as strong in the Jewish people as in any other; and the conditions which threaten the continued existence of the Jewish people in modern times are not wholly referable to anti-Semitism in any of its phases. They are equally present in countries in which anti-Semitism does not exist, or, if it exists, does not seriously affect the civic, social or economic position of the Jews. In such countries—which include, broadly speaking, all the countries of the western hemisphere except those of the old Russian and Austrian Empires and Rumania—the rapid assimilation of the Jews to the prevailing modes of life and thought is accompanied by an attenuation of the tie which binds them to their people, with the result that emancipation is a more potent enemy of Jewish solidarity and of Judaism than persecution or the milder forms of anti-Semitism. It follows that from the point of view of the Jews, which of course postulates the desirability of the continued existence of the Jewish people and of Judaism, the substitution of conditions of emancipation for conditions of persecution solves one problem only by creating another. Naturally enough, this was not foreseen by Moses Mendelssohn and the other pioneers of Jewish emancipation in Europe. They took it for granted that the Jew, having emerged from the ghetto and divested himself of the external peculiarities which cut him off from European life, would still be able to maintain his religious separateness, and to carry out a specifically religious and moral mission in the modern world. But experience has shown them to have been wrong. Judaism reduced to a set of religious beliefs and practices, or to a moral code with some superstructure of ritual, has no abiding hold on the Jew. The possibility of the continued existence of the Jewish people and of Judaism stands or falls with recognition of the fact that to be a Jew means primarily to be a member of a particular ethnic group. On that basis it is possible to build attachment to Judaism as religion or as moral teaching; without that basis the Jew is powerless to withstand through successive generations the forces of an environment which is always drawing him away from his own tradition, in its religious, ethical and intellectual aspects even more than in its ceremonial aspect. Hence a reaffirmation of the national idea in Judaism is even more readily intelligible as a reaction against the results of emancipation than against persecution.

It is not surprising, therefore, that, when the case for Jewish nationalism was first presented by a Jew in a European language, it was based on the disintegrating effects of assimilation rather than on the sufferings of the unemancipated Jews. In his *Rom und Jerusalem*, published in 1862, Moses Hess delivered a trenchant attack on the theory of German "Reform" Judaism, showed that Judaism could not live except on the basis of the national idea, and foretold a spiritual and political rebirth of the Jewish people in Palestine. Fourteen years later Jewish Nationalism was advocated on similar lines by George Eliot in *Daniel Deronda*. For both writers the essential thing is that the Jewish people should have an opportunity of taking up the broken thread of its history, and of expressing its own spirit and characteristics in a form of life shaped by itself. Considerations based on anti-Semitism are secondary.

Even in Russia, for so long the home of the great masses of Jews and the very temple of governmental anti-Semitism, Zionism was not fundamentally a product of persecution or pogroms. Until well after the middle of the 19th century, the best minds of Russian Jewry saw its hope in emancipation, not in nationalism. They thought that if the Jews of Russia discarded their distinctive language and dress, modified their religious ceremonial so as to make it compatible with European life, and sent their children to Russian schools, they would be admitted to full participation in the life of their country, like the Jews of western Europe, and all would be well. A vigorous propaganda on behalf of *Haskalah*—"enlightenment" or "modernism"—had been carried on for some decades in the Hebrew language, which was used not because of its national associations, but because the apostles of *Haskalah* disdained to write in Yiddish, and no European language was intelligible to those whom they wished to influence. *Haskalah* had made considerable headway against the obscurantism of those who opposed any and every change in Jewish life; and in the ’seventies of the 19th century the liberal policy of Alexander II. seemed to promise success to its efforts to modernize Russian Jewry. But already, within the modernist movement itself, another current of thought had set in. Perez Smolenskin, one of its most gifted champions, who spent the best years of his life in Vienna, had had the opportunity of seeing at close quarters what emancipation meant for Judaism. He had seen that in practice the ideal of being “ a Jew at home and a man outside ” did not work. Hence he became the advocate of a Jewish nationalism based on the “ triple cord ” of the Land (Palestine), the Law (*Torah*) and the Language (Hebrew). When, in 1880, the emancipatory tendencies of Alexander II. gave place to a wave of pogroms and a policy of systematic oppression, the seed sown by Smolenskin bore fruit. While the great majority of the Russian Jews who fled from massacre naturally made for the economically developed countries of the West, where they could be readily absorbed, a few, inspired by the ideal of a national revival, found their way to Palestine, and in the face of incredible difficulties laid the foundations of Jewish agricultural colonization. Supported by the *Chovevê Zion* (Lovers of Zion) in Russia, and later more amply by Baron Edmond de Rothschild, of Paris, these pioneers succeeded in maintaining their footing in Palestine. They were followed by a small but steady stream of immigration, which included many vigorous and self-supporting elements. Innocent of any concern with international politics, these Palestinian settlers accepted the Turkish administration as they found it, and, thanks largely to its very indifference, were able to establish little settlements with complete internal autonomy, to live in their own way, to manage their own affairs, and, not least important, to create a system of Hebrew schools, by means of which the ancient language of the Jews was revived as the speech of the younger generation of Jews in Palestine. This new Palestinian *Yishub* (settlement), strengthened in the early years of the present century by a number of young men and women who went to Palestine with the ideal of working as labourers on its soil, became the basis of the political success which Zionism achieved during the World War. The historic connexion of the Jews with Palestine would not of itself have availed to secure recognition of Jewish national aspirations, had there not been this concrete evidence of the will and the ability of the Jews to rebuild Palestine and their own national life in Palestine.

Side by side with this practical colonization work, the development of Jewish nationalist theory went on in Hebrew literature. The implications of Smolenskin’s idea were worked out more thoroughly, and from a standpoint more in consonance with European thought, by Asher Ginzberg (*Achad ha-Am*), one of the early leaders of the *Chovevê Zion*, who has made his own the conception of Palestine as destined to be in the immediate future the “ spiritual centre ” of the Jewish people—that is to say, the home of a corporate Jewish life expressing in all its aspects the true qualities of the Jew, and serving for that reason as a point of attachment and a source of spiritual influence for the Jews of all the world, who will find in their common association with the spiritual centre a new basis of unity and a new bulwark against absorption by assimilation. This conception, though by no means universally accepted as a complete statement of the philosophy of Zionism, has had a profound effect on Zionist thought for the last 30 years, and, though it designedly leaves on one side the political implications of Zionism, has contributed materially to the final shaping of the political claims of the movement.

The reaction against anti-Semitism has, however, played an important port in Zionist history. In 1882, after the terrible outbreak of pogroms in Russia, a Russian Jew, Dr. Leo Pinsker, published a striking pamphlet, in German, under the title of *Auto-Emancipation*, in which he argued that Judeophobia was an endemic malady among the peoples of the world, analogous to the fear of ghosts, and that the only solution of the “ Jewish problem ” was to be found in the establishment in some suitable territory (not necessarily Palestine) of an autonomous commonwealth of Jews. While Pinsker thus took anti-Semitism as his starting point, he yet showed a certain appreciation of the historical and psychological roots of Jewish nationalism; and when his own scheme of large scale emigration to a hypothetical Jewish territory met with no support, he was nationalist enough to throw himself into the Palestinian work of the *Chovevê Zion*, whose first President he became. The later and more famous brochure of Dr. Theodor Herzl, *Der Judenstaat*[1] (1896), elaborated independently a scheme similar to that of Pinsker, based entirely on the need of a refuge from anti-Semitism, and disregarding completely the inner springs of Jewish nationalism. Herzl’s argument implies throughout that all would be well if only Jews were allowed to assimilate peacefully to their surroundings; and to that extent he stood on the same ground as the assimilationist Jews of western Europe, who had for years been trying—without success—to alleviate the lot of the Jews of Russia and Rumania by bringing about diplomatic intervention with the Governments of those countries. He differed from them only in seeing the futility of their methods and the need for more radical steps. He did, however, assert the unity of the Jewish people (“ we are a people, *one* people ”), and the emancipated Jews of western countries, fearful of anything that might seem to cast doubt on their absolute identification with the nations among which they lived, could not accept a scheme based on such promises. With few exceptions, the Jews of the west met Herzl’s appeal with indifference or hostility; it was the *Chovevê Zion* who rallied to his support with enthusiasm, less conscious of the difference between his philosophy and their own than of the value to their movement of his great personality, vision and influence. Thus there came about a fusion between the older Jewish nationalism, rooted in history and attached by its very nature to Palestine, and the newer so-called nationalism which demanded an autonomous territory in Palestine or elsewhere for those Jews who could not or would not assimilate to their European surroundings. The fusion was not effected without tears. At the first Zionist Congress (Basle, 1897) there was a struggle over the crucial question of the mention of Palestine in the programme of the movement. For Herzl’s scheme of rapid mass-settlement scarcely any country could have been worse adapted than Palestine, with its restricted area, its neglected soil and its importance in international politics; but the nationalist instinct of the Russian Jews won the day; and the Zionist organization tied itself down to the aim of “ establishing for the Jewish people a home in Palestine secured by public law.”[2] The trouble did not end there. For the *Chovevê Zion* the gradual building up of a Hebrew life in Palestine—*Yishub Erez-Israel*—was the fundamental nationalist activity. Herzl, on the other hand, deprecated any “ infiltration ” into Palestine so long as the conditions necessary for full autonomy were not secured. He desired the acquisition by the Jewish people still outside Palestine of a formal charter making Palestine its preserve; immigration on a large scale would follow. The failure of his efforts to secure a charter, and his premature death in 1904, ultimately gave the victory here also to the tendency represented by the *Chovevê Zion*. Thus Zionism emerged from the seven years of Herzl’s brilliant leadership with its pre-Herzlian philosophy and policy substantially unchanged, but with very considerable gains in organization, in prestige, and in the number and diffusion of its adherents. The movement had become world-wide; it had been recognized by the British Government (in the abortive offer of a territory in E. Africa, 1903) as representing the Jewish people; and it had become a powerful leaven in Jewish life, stimulating interest in Palestine and the revival of the Hebrew language in every Jewish community throughout the world. The Zionist organization, though it could not of itself bring about any serious political change in Palestine, was in a position to secure that, if and when the political future of Palestine became a practical question, the claims of Jewish nationalism should not go unheard.

---

[1] The current translation “ A Jewish State ” is misleading. The prefix *Juden* has not the qualitative implications of “ Jewish ”; the German *Staat* does not connote political independence so definitely as the English “ State ”; and the emphasis in *Judenstaat* is on the first half of the compound, whereas in “ Jewish State ” it is inevitably on the second. “ A Commonwealth of Jews ” is a better rendering. This point is of some importance, because critics of Zionism have fastened on the term “ Jewish State ” as implying a desire to set up a State based on religious tests—than which nothing could be further from the idea of Herzl and of Zionists generally.

[2] *Öffentlich-rechtlich gesicherte Heimstätte* in the original German. The old translation “ publicly and legally assured home ” (*see* 28.988) is scarcely adequate. In article (4) of the Programme as there set out, “ grants ” should be replaced by “ consents ” (*Zustimmungen*). Zionism has never expected or asked for a financial grant from any Government.

Meanwhile it had to be content with the up-hill work of Palestinian colonization and the education of the Jewish people in the national idea. The number of Jewish agricultural settlements in Palestine grew from about 25 in 1904 to about 45 in 1914. The Hebrew school system developed rapidly, and the project of a Hebrew university in Jerusalem was definitely launched in 1913. The membership of the organization and the capital of the Jewish National Fund grew from year to year, and unorganized sympathy with the Zionist outlook and aims became more and more widely diffused.

The entry of Turkey into the World War called for a renewal of political activity on the part of the Zionist organization, as it obviously meant that the future of Palestine would before long come up for settlement. At the same time, the position of the organization was extraordinarily difficult. With adherents in all countries, both belligerent and neutral, it could not present a united front in international political questions, and the leaders of its various groups could not even take counsel together. The last biennial Zionist Congress had met in 1913; a Congress in 1915 was obviously impossible. Emergency arrangements were made to secure the existence of the organization, but for practical purposes it had to remain in suspense throughout the unexpectedly long period of hostilities. Meanwhile, the need for obtaining express recognition of Zionist claims became more pressing as a result of the British advance into Palestine in 1917. Relations with the principal Allied Governments had already been established, mainly by Dr. Ch. Weizmann and Mr. N. Sokolow, two of the Zionist leaders. As the outcome of protracted negotiations, in which Sir (then Mr.) Herbert Samuel played an important part, the British Government issued on Nov. 2 1917 the "Balfour Declaration," stating that they "view with favour the establishment in Palestine of a National Home for the Jewish people, and will use their best endeavours to facilitate the achievement of this object," and adding provisos to safeguard the rights of existing non-Jewish communities in Palestine and the rights and political status enjoyed by Jews elsewhere. The Allied troops entered Jerusalem soon afterwards (Dec. 9 1917), and in March of the following year the Balfour Declaration had its first practical outcome in the departure for Palestine of a Zionist Commission, which was to "act as an advisory body to the British authorities in all matters relating to Jews or which may affect the establishment of a national home for the Jewish people," and was charged with certain specific tasks in relation to the Jewish population of Palestine. The Commission remained in Palestine as the representative of the Zionist organization, and there directed such Zionist work as was possible during a period of unsettlement and restricted communications. In July 1918 it laid the foundations of the future Hebrew University on Mount Scopus.

The Turks were finally expelled from Palestine in Sept. 1918, and the Zionist policy of the British Government, which had in the meantime been endorsed by all the Allied Powers and by the President of the United States, had its logical outcome in the incorporation of the Balfour Declaration in the Treaty of Sèvres and the acceptance by Great Britain of a Mandate for Palestine on behalf of the League of Nations (San Remo, April 1920). The draft Mandate as printed in a Parliamentary White Paper (Cmd. 1176), recites in its preamble the substance of the Balfour Declaration, whereby "recognition has been given to the historical connexion of the Jewish people with Palestine and to the grounds for reconstituting their national home in that country," and provides *inter alia* that the Mandatory shall be responsible for placing the country under such political administrative and economic conditions as will secure the establishment of the Jewish national home and the development of self-governing institutions (Art. 2); shall recognize an appropriate Jewish agency (provisionally the Zionist organization) as a public body for the purpose of advising and coöperating with the administration of Palestine in matters affecting the establishment of the Jewish national home (Art. 4); shall appoint a special Commission to study and regulate all questions and claims relating to the different religious communities (Art. 14); shall see that complete freedom of conscience is assured to all (Art. 15); and shall recognize Hebrew along with English and Arabic as an official language (Art. 22).

The frontiers of Palestine were defined in a separate convention between Great Britain and France dated Dec. 23 1920, and published in a White Paper (Cmd. 1195). In 1916, before either Government had come into close contact with Zionism, an Agreement (known as the Sykes-Picot Agreement) was made, dividing Palestine into a British and a French sphere of influence. This agreement needed revision in the light of subsequent developments, with due regard to both Arab and Zionist interests as well as to those of the two Powers concerned. The Convention of 1920 defines the frontiers of Palestine in such a way as to comply with the requirements of the historic phrase "from Dan to Beersheba," and to include in Palestine all the modern Jewish agricultural settlements, but not to give Palestine control of the sources of water power which are held to be necessary for its full economic development. On the other hand, the Agreement provides that Palestine is to have the use of the waters of the Upper Jordan and the Yarmuk and their tributaries, after satisfaction of the territories under the French mandate.

The draft Mandate for Palestine was attacked from three sides. Certain Palestinian Arabs, professing to speak in the name of the whole Arab population, objected absolutely to its Zionist provisions. A school of Zionists more or less in the line of the original Herzlian tradition complained that the draft Mandate gave too little to the Jewish people, and that the term "National Home" was too vague, and demanded that explicit provision should be made for the development of Palestine into a "Jewish State" within a fixed period. Lastly, some British politicians and newspapers attacked the Mandate on the grounds that it would involve the British taxpayer in expense with no corresponding return, and that it was unjust to impose a Zionist policy on the Arabs of Palestine against their wishes.

Despite these criticisms, there was every sign up to the end of 1921 that the Government intended to proceed in full accord with the spirit and the letter of the Balfour Declaration. Mr. Winston Churchill, the Secretary of State for the colonies, during his visit to Palestine in April 1921, emphatically declared that the Zionist policy of the Government remained unchanged, while assuring the Arabs with equal emphasis that their rights would be fully respected. The First High Commissioner, Sir Herbert Samuel, had won the confidence of all sections of the population by his impartiality.

Blondheim, 1918); Theodor Herzl, *Zionistische Schriften* (English translation of *Der Judenstaat* and of his Congress Addresses published by the Federation of American Zionists, 1917); Achad ha-Am, *Selected Essays*, translated by Leon Simon (1912); Richard Gottheil, *Zionism* (1914); Adolf Friedemann, *Das Leben Theodor Herzls* (1914); Kurt Nawratzki, *Die Jüdische Kolonisation Palästinas* (1914); *Zionism and the Jewish Future*, edited by H. Sacher (2nd ed. 1917: with bibliography); A. M. Hyamson, *Palestine: The Rebirth of an Ancient People* (1917); H. Sidebotham, *England and Palestine* (1918); Nahum Sokolow, *History of Zionism, 1600–1918* (2 vols. 1919: with bibliography); Norman Bentwich, *Palestine of the Jews* (1919); Shmarya Levin, *Out of Bondage* (1919); Leon Simon, *Studies in Jewish Nationalism* (1920); *Zionism* (Foreign Office Handbook, No. 162, 1920). There is also a voluminous periodical and pamphlet literature. *Zionism and the Future of Palestine* by Morris Jastrow, Jr. (1919) puts the "assimilationist" case against Zionism. (L. St.)

ZIRKEL, FERDINAND (1838–1912), German petrographer, was born at Bonn in 1838. He was educated at Bonn, where he trained as a mining engineer, but a journey he made to Iceland and the Faeroe Is., Scotland and England, and a meeting with Henry Clifton Sorby (*see* 25.431) attracted him to the study of microscopical petrography, then a comparatively new science. He became professor of mineralogy and geology successively at Lemberg (1863), Kiel (1868) and Leipzig (1870), retiring from the last-named post in 1909. He did much to develop the study of petrography, and his *Lehrbuch der Petrographie* (1866; 2nd ed. 1893–4) is a standard work on the subject. He was an hon. D.Sc. of Oxford, and also a foreign member of the Royal Society and an hon. member of the Mineralogical Society. He died at Bonn June 11 1912.

ZOBEIR RAHAMA (1830–1913), Egyptian pasha (*see* 28.992), died at Geili, near Khartum, Jan. 5 1913.

ZOÖLOGY (*see* 28.1022).—It is a sign of the vitality of a science such as zoölogy that its aspect should change from generation to generation. Paths of inquiry which are eagerly followed for one quarter of a century are sometimes almost forsaken during the next. There is change of emphasis and perspective. The reasons for this are mainly four. (1) A great discovery, such as Mendel made, opens up the possibility of conquering a territory hitherto unsubjugated, and this secures the enthusiasm of pioneers. (2) A new idea, such as that of discontinuous variations or mutations, alters the traditional outlook and is bound to affect zoölogical activity, *e.g.* taxonomy in the case mentioned; or a new scepticism, *e.g.* in regard to the transmission of exogenous somatic modifications ("acquired characters"), may prompt effort in reinterpreting facts. (3) A new contact, such as is suggested by the terms biochemistry and biophysics, biopsychology and psychobiology, always means a fresh series of formulations, making, in synthesis, for a more complete apprehension of that well-integrated unity—the Organism—which the various analytic methods seek to understand from different points of view. (4) A new method—such as section-cutting, differential staining, the use of the ultra-microscope, the utilization of statistics—may prove so rewarding that it attracts many recruits to its service, with the result that the trend of zoölogy is for a time markedly in that direction. There are other factors which change the aspect of zoölogy from generation to generation, such as the influence of great masters, like Huxley, Balfour, and Lankester; and the claims of the nation for scientific counsel, *e.g.* as regards agriculture, breeding, fisheries, and insect-pests. Moreover, the reflective intelligence of the scientific workers themselves, who have an ideal of the unity of their science, makes them tend, deliberately or subconsciously, to fill up gaps, as may be illustrated by the relatively recent development of the scientific study of animal behaviour.

For such reasons as have been indicated the aspect of zoölogy has changed considerably since the opening of the 20th century, though it may be safely said that the things that remain much the same are of more importance than most of the novelties. Of some of the significant new departures, which led to notable results in the period 1910–21, account is taken in separate articles, *e.g.* under BEHAVIOURISM, BOTANY, CYTOLOGY, ECONOMIC ENTOMOLOGY, MEDICAL ENTOMOLOGY, EMBRYOLOGY, SEX, GENETICS, MENDELISM, PROTOZOÖLOGY. What is attempted in the present article is a general survey, which may be conveniently arranged under the headings: Morphological, Physiological, Embryological and Aetiological (Evolutionary).

(A) MORPHOLOGICAL ZOÖLOGY

In its full scope morphology has to do with the static relations of organisms, with form and structure, as contrasted with physiology, which is concerned with the dynamical problems of vital activity. The two inquiries are obviously complementary and indispensable. It is a narrow view which affects to despise "purely morphological research"; as is obvious enough when any distinctively new type, like the sedentary ctenophore *Tjalfiella*, or the elusive Okapi, comes under consideration. Yet it must be admitted that zoölogical activity has in some measure turned aside from accumulating details of comparative anatomy at any and every level of analysis. As a discipline descriptive morphology is indispensable, but it is not to be persisted in too long, when there is so much else awaiting investigation. There is a widespread and not unreasonable opinion that morphological researches require some justification beyond their immediate result; they should contribute to our knowledge of affinities, of adaptations, of principles of architecture, and laws of change, as the best morphology has always done.

Causal Morphology.—The distinctive modern change has been the coming together of physiology and morphology, which developed for so long on paths that seldom even crossed. As E. S. Russell says, in his scholarly and critical *Form and Function* (1916), "Until well into the 'eighties animal morphology remained a purely descriptive science, content to state and summarize the relations between the coexistent and successive form-states of the same and of different animals. No serious attempt has been made to discover the causes which led to the production of form in the individual and in the race" (p. 314). The evolution theory offered only a formal solution, and for all practical purposes physiologists took the animal organization as given, not troubling about its mode of origin. Not a few saw the need of definitely tackling the physiology of development, notably Prof. W. His, in his well-known work, *Unsere Körperform und das Problem ihrer Entstehung* (1874), but the credit of founding a new sub-science of causal morphology (*Entwicklungsmechanik*) on an experimental basis certainly belongs to Prof. W. Roux, who has had many followers. The aim of *Entwicklungsmechanik* is defined by Roux to be "the reduction of developmental events to the fewest and simplest causal processes." Two classes of causal processes may be distinguished, as "complex components" and "simple components" of development. "The latter are directly explicable by the laws of physics and chemistry; the former, while in essence physico-chemical, are yet so very complicated that they cannot at present be reduced to physico-chemical terms. . . . They represent biological generalizations, in their way of equal validity with the generalizations of physics and chemistry" (Russell, 1916, p. 319). They are, in fact, the general properties or functions of organized matter, such as assimilation and dissimilation, growth and reproduction, heredity and self-differentiation.

Biophysics.—A special department of causal morphology may be usefully designated biophysics. As in regard to chemical processes, so in regard to physics, there is great promise in those investigations which carry up into the study of organisms the laws and lessons of the inorganic. An auspicious beginning of this difficult task has been made by Prof. D'Arcy W. Thompson, in his *Growth and Form* (1917), one of the foundations of biophysics. The aim of this inquiry is "to show that a certain mathematical aspect of morphology, to which as yet the morphologist gives little heed, is interwoven with his problems, complementary to his descriptive task, and helpful, nay, essential to his proper study and comprehension of form." Factors to be reckoned with are size, the principle of minimal areas, surface tension, equilibrium, the rate of growth in different directions, and the properties of colloids. The essay marks a big advance in the interpretation of form, whether in external structures like molluscan shells, the twisted horns of mammals and the shapes of eggs, or in internal architecture, like that of a bone, where statical and dynamical principles find fine illustration. Luminous also is Thompson's theory of transformations, in which it is shown how a single harmonious deformation may lead from one form of skull or leaf to that of a related type; and how trammels or lines of constraint may determine the action of the expansive forces of growth, now in one direction and now in another. This is more than an approach to the principles of morphogenesis.

Let us state this step of progress concretely. Exact study has shown that the thigh-bone, for instance, is in its proportions and structure mechanically correct. It has great strength with a maximum economy of material, and the internal beams are in their thickness and closeness of spacing demonstrably adjusted to the intensity of the stresses to be withstood. So far well; but the further step is to utilize the principles of physics in accounting, as far as may be, for the vital architecture. A guillemot lays a single top-shaped egg on a narrow shelf of a precipitous sea-cliff. Now Darwin pointed out that when an egg of this shape is roughly jostled by the wind or by the parent bird, it will rapidly rotate on its short axis, but will not roll away from the spot. The mechanical adjustment is simple and effective, but the further question is how far the adaptive result can be accounted for in terms of the physical conditions of pressure, surface-tension and the like, operative on the egg-shell while it is still in the making in the oviduct. It is for the student of biophysics to work this out.

Enough is not yet known of the possibilities of another line of physiological morphology, represented by the work of Prof. C. M. Child, *Individuality in Organisms* (1915), which seeks to interpret structural differences in terms of different rates of metabolism at the various levels or "gradients" of the axis of body-symmetry.

Homoplastic Structures.—Criticism of the concept of homology (resemblance in embryonic origin and fundamental structure) has brought into prominence the kind of resemblance which Sir Ray Lankester called "homoplasy," to which others have applied other terms, such as "convergence." It is a resemblance in types not closely related, and is due to the similar adaptation of non-homologous structures to similar conditions of life. But it is plain that the idea requires careful handling. There are cases where homologous parts become adaptively very like one another, directly or indirectly in relation to similar functioning, as in the case of the "paddles" of ichthyosaurs, turtles, penguins and cetaceans. To such cases it has been proposed to apply the term "parallelism," while Prof. Gadow (1913) has carried the analysis further, distinguishing "isotely" (hitting the same mark), *e.g.* zygodactyl feet of cuckoos, parrots, and woodpeckers, from "homaeotely" (hitting the same target, but not quite the same mark), *e.g.* the jumping foot of kangaroo, jerboa and Tarsius. Both of these have to be clearly separated from what many call true convergence, which Prof. Gadow has called "parately," where the feature has been evolved from parts and material so different that there can be little relationship, if any. The resulting resemblance is more or less superficial. Thus the bivalve shell of Brachiopods has nothing to do with that of Lamellibranchs, and the *bulla auris* of certain extinct reptiles (Pythonomorpha) is probably the quadrate, while that of the cetacea is the tympanic. Similarly, it is probable that the eye was evolved many separate times. Now the well-marked convergence or homoplasy of non-homologous structures depends on a coöperation of factors: *e.g.* (*a*) the widespread occurrence of certain similar hereditary factors which will respond much in the same way to similar environmental conditions; (*b*) the plastic power of similar functioning, operating in individual development; and (*c*) the similarity in the sifting process of natural selection. Along with (*a*) may be included the idea that the number of new departures is probably far from being unlimited; along with (*c*) may be included the idea that the biophysical conditions of stability are within relatively narrow limits; and along with (*b*) the similar moulding of similar functions may be included, as Gadow says, the subtle effects of correlation. It is probable that the continuation of the interesting study of convergence, along the lines indicated by Lankester, and more fully by Willey and Gadow, will lead to a deeper understanding of the principles of organic architecture or morphogenesis. It may also throw some light on classification, for it is worth considering whether the same congeries of characters may not arise more than once, and that not fortuitously. Prof. Gadow refers to his finding in Mexico the burrowing snake, *Typhlops braminus*, previously known from islands and countries of the Indian Ocean basin, a fact which suggests to him that the species had evolved twice. Some would say indeed that three similar domestic dogs might be traced to three different ancestors, a coyote, a jackal, and a wolf. The question also arises whether this promising study of convergence or homoplasy will not also elucidate close pattern-resemblances between forms, in regard to which it is impossible to suggest any genuine mimicry.

The Question of Species.—A huge number of new species of animals are described annually, sometimes several thousand insects in one year. When a collection has to be reported on or a new region explored, there is obvious need for the old-fashioned definition of new species, *i.e.* forms which do not conform to any previously described. To give one of these novelties a new name, if it is marked off by peculiarities of some magnitude (necessarily to some extent a matter of opinion), is practically a much more desirable procedure than the restraint which says: "*Mus n. sp.*, in the vicinity of *Mus sylvaticus*," for this makes subsequent reference intolerably tedious. But several changes may be detected in the zoölogical species-making of to-day. (1) There is no longer much enthusiasm for this line of activity in itself. It is a necessity, a useful discipline; but there is no particular hurry in completing the descriptive catalogue; there are more urgent affairs. (2) The task is now approached with a deeper sense of responsibility, for it is recognized that every peculiarity does not mean a new species. Many peculiarities are transient somatic modifications which are reimpressed on successive generations as long as the same incident factors are operative. Other peculiarities are not beyond the range of the variations which occur within the limits of one family, the progeny of one pair. It is a pious opinion that a new species should be based on numerous specimens, and that something should be known of the genetic behaviour of its peculiarities. (3) More attention is being given to the occurrence of variations and mutations, which, instead of being put in a corner as inconveniences, are now regarded as of no less interest than the rank and file of the species. Polymorphic species, like the ruff, are more interesting biologically than relatively fixed species like the pheasant. (4) But along with this increased and more analytic attention to variations, which have to be studied from the point of view of genetics, and if possible experimented with, there is an increased recognition of the other side—the discontinuity or apartness of species. It is difficult to maintain that the category *species* is univalent throughout, *e.g.* that it has the same value among micro-lepidoptera as it has among birds, but in all sound taxonomy a species is marked by its definite specificity. The tendency is toward a recognition of fixity as even more characteristic than flux. In many cases it seems safe to say that species differ in the presence or absence of unit characters, or in the arrangements of their unit characters, whose gametic factors exhibit Mendelian behaviour. (5) If species differ, like a series of organic compounds or like a series of related minerals, in their internal constitution, then it is no longer necessary to insist on the utilitarian value or adaptive significance of the specificities. That specific characters are often adaptive seems undeniable; that they need have this value is highly improbable (see Bateson, 1913).

Taxonomy Criticised.—Supposing the most satisfactory description of a new species, based on numerous specimens living in known environment, and supposing even some acquaintance with the genetics of the species, we must face the further question whether zoölogical work at this Linnaean level is worth while. It is in a way hodman work, though few do it very well. It is very quantitative work, adding leaves to inherited monographs. It tends to preoccupy the investigator, leaving him with little time or inclination for more adventurous pursuits. It leads to little in itself. Thus there is a widespread conviction that the day of the pure systematist is past, and should be declared as past.

But this is perhaps not more than a wholesome rebound from an unsatisfactory species-mongering. In any case there is another side to the criticism. If a region is to be surveyed in a business-like way, *e.g.* the Zoölogical Survey of India initiated and directed by Dr. Nelson Annandale, there must be a perfectly precise census. For practical purposes it is indispensable that there be no vagueness about the species of (say) mosquito and tick. The meticulous thoroughness, sometimes scoffed at by the impatient, may save the lives of thousands. Moreover, a new type with real taxonomic importance comes every now and then as the reward of drudgery. Nor can it be doubted that an evolutionary study of species, especially when it can be linked to genetic studies of the living material, may lead us nearer the main object in view—the understanding of life. Educationally, it may be doubted if the Linnaean discipline of species-making can be dispensed with without serious loss of efficiency.

Palaeontological Study.—The *differentia* of palaeontology is that it studies organisms in their time relations, in their genetic sequence from age to age. A taxonomy based only on a study of forms extant—"a horizontal section across the tree of life"—may be shrewd, but it is incomplete without the work of the palaeontologist who exposes the relations of the buried branches. It is certain that palaeontological research has done well by zoölogy in this respect, as may be well illustrated by the later work of Prof. D. M. S. Watson on the taxonomy of amphibians, reptiles and mammals, or by the magnificent history of the extinct Equidæ which has crowned the labours of Prof. H. F. Osborn.

Another achievement of the palaeontologists has been their increasingly satisfactory vindication of evolution as a historic process. Thus, to quote Dr. F. A. Bather (1920, p. 67): "if we take a chronological series of apparently related species or mutations, a^1, a^2, a^3, a^4, and if in a^4 we find that the growth-stage immediately preceding the adult resembles the adult a^3, and that the next preceding stage resembles a^2, and so on; if this applies, *mutatis mutandis,* to other species of the series; and if, further, the old age of each species foreshadows the adult character of its successor; then we are entitled to infer that the relation between the species is one of descent." This method of proving filiation is clearly illustrated by work on Ammonites. "Thus, large ammonites of the *Xipheroceras planicosta* group, beginning smooth, pass through a ribbed stage, which may be omitted, through unituberculate and bituberculate stages, back to ribbed and smooth again" (Bather, 1920, p. 68).

It is clear that taxonomic categories based on the study of existing forms must be supplemented by new categories disclosed by the palaeontologists' study of change in time. "Thus many crinoids with pinnulate arms arose from others in which the arms were non-pinnulate. We cannot place them in an order by themselves, because the ancestors belonged to two or three orders. We must keep them in the same orders as their representative ancestors, but distinguish a *Grade* Pinnata from a *Grade* Impinnata" (Bather, 1920, p. 63).

To the palaeontologists are due, we think, convincing proofs that evolutionary change may be sometimes continuous, by gradual transition rather than by saltation. In their contributions to such problems as orthogenesis, the rise and decline of species, the tempo of evolution, and the correlation of organic with cosmic changes, the palaeontologists have certainly kept pace with the "neontologists."

Animal Histology.—Without unduly trespassing on the article CYTOLOGY, we may indicate some general features of recent progress in animal histology. (*a*) The concept of the cell has become more fluid; for we recognize cells without very definite limits living in syncytia, cells with protoplasmic bridges binding them to their neighbours, cells with nuclear dust instead of a nucleus, and so on. Many zoölogists agree with Prof. Clifford Dobell that to speak of a Ciliated Infusorian (let us say) as a single cell is more misleading than useful. It is rather a noncellular than a unicellular being; it has not entered upon the cellular line of evolution; it is a complex organism with much division of labour, and no Metazoan cell can be said to be on a par with it. Similarly, it is a suggestion of a fallacy in calling an ovum a single cell; for it has a complexity beyond imagining, it is a highly endowed implicit organism. (*b*) It is no longer easy to be satisfied with the oft-repeated comparison of a multicellular organism to a colony or regiment of cells. It has become clearer that cellular structure is largely a segregating device for the better working of that division of labour which the intricacy of vital processes demands. (*c*) If we take as a good example the recent *Introduction to Cytology* (1920) by the late Prof. Doncaster, we find that our picture of the animal cell has become extraordinarily complex. In the cell-substance or cytoplasm there are in many cases definitely formed granules or rods (mitochondria) which sometimes have to do with the formation of particular protoplasmic products; there are very frequently strands or rods of the "Golgi apparatus," the significance of which is very obscure; there are also "chromidia" which sometimes appear like migrants from the nucleus attempting to colonize the cytoplasm. In the centre of the cytoplasm floats the nucleus, microcosm within microcosm. It has its differentially permeable membrane; its chromosomes, usually definite in number for each species; its nucleolus, which may be a karyosome of chromatin or a plastosome of plastin; and the karyolymph, bathing both chromosomes and nucleoli. Then there are the centrosomes, which play an important part in organizing the process of nuclear division. But this is not nearly all, for each chromosome is like a necklace of beads threaded on a transparent ribbon of linin, and these beads or microsomes are probably the biological units of the lowest visible grade. In curiously indirect ways it seems possible (Morgan, 1919) to make a sort of map of the chromosomes of an egg-cell, and to say, for instance, that such and such hereditary factors of the fruit-fly Drosophila are located in the upper third of the second chromosome. In some cases it is possible to tell from visible peculiarities in the chromosomes of a fertilized egg-cell whether it would have developed into a male or into a female. These are but illustrations of the increasing precision. (*d*) In another direction, however, modern work has led to simplification, namely as regards cytoplasmic structure. The 19th-century histologists accepted with little question the view that the reticular, fibrillar, or other fine structure seen under high power in fixed and stained cells corresponded to a genuine architectural complexity in the living cell. But the work of Hardy (1899) and Fischer (1899) showed that the alleged structure is mainly of the nature of artefact, and that different structure is revealed according to the histological methods used. The use of the ultra-microscope has confirmed the conclusion that protoplasm in a living condition is a structureless fluid with particles and droplets in a freely movable state—a colloidal system in short. There must be arrangements which permit of the simultaneous occurrence of very different chemical processes in adjacent parts of the cell, but this is not of the nature of a visible cytoplasmic architecture, and it may be of the nature of a temporary gelation (see Bayliss, 1915, chap. i.). (*e*) Just as the early microscopists described and figured many structures under magnification without making them more significant or intelligible, so in the immense library of zoölogical histology there is a prodigious amount of meticulous description that is not very illuminating. Too much of it has been a registration of artefacts; and it may be fairly noted as characteristic of recent years that mere micrography is finding fewer devotees. The achievements of differential staining are giving place to a reasonable biochemical microscopy. For it is plain that the analytical study of minute structure does not justify itself—apart from demonstrating specificity and a succession of plasmic phases—unless it throws light on what happens in the cell-laboratory—the oxidations and reductions, the hydrations and condensations, the synthetic and analytic processes which constitute vital metabolism. These chemical reactions take place with extraordinary speed, which is conditioned by the activity of enzymes, and also with not less extraordinary orderliness, which is conditioned by some localizing (as it were insulating) arrangements of the colloidal system of the cell. But an analogy probably more fitting than that of a laboratory is that of a factory, for it seems clear that cytoplasm, nucleus, centrosomes, mitochondria and so forth are working together, and potent in their inter-relations.

Thus, to take an obvious case, there appears to be, as Richard Hertwig and others have emphasized, a definite volumetric ratio between the nucleoplasm and the cytoplasm of the cell. Interesting results have also rewarded the inquiry into the changes in this relation which occur in regenerative processes, in the growth of tumours, in the segmentation of the ovum, or when a microbe enters a cell, and disturbs its equilibrium.

(B) Physiological Zoölogy

Along the line of comparative physiology the rate of progress during the last 20 years has not been proportionate to the importance and attractiveness of this line of investigation. There have been many individual researches of value, but there has been no adequate continuation of the broad and well-conceived work of Krukenberg 30 years ago. The difficulty is that few zoölogists are expert in biochemistry, without which many paths of physiological research are impassable, and that few biochemists are aware of the many and pressing zoölogical problems that promise great results. It may be doubted whether in the whole range of zoölogy there is any kind of investigation more likely than comparative physiology to yield new knowledge of first-rate importance. Just as the discovery of the significance of the glands of internal secretion (suprarenals, thyroid, etc.) has profoundly influenced the physiology of the vertebrates, so will a deepened physiology of the invertebrata modify the whole science.

Recent Advances.—Although we are still awaiting concerted prosecution of comparative physiology, there have been numerous advances of great interest, of which two or three illustrations must suffice. (*a*) G. H. Parker's working-out of the various grades of nervous activity exhibited by a series of animals from sea-anemone upward is a good example of a physiological inquiry of immediate interest in itself and also important in its bearing on the evolution of behaviour. (*b*) The continuation of the study of animal pigments may be illustrated by the work of Oscar Riddle, and not less interesting are such investigations as those of Gamble on the Aesop Prawn, of Sumner on the changeful patterns of flat-fish (*see* Colours of Animals), and of Minkiewicz on the apparent colour-disguises which some crabs find in the seaweed with which they mask themselves. (*c*) Also very promising is the inquiry (*e.g.* by Holmes and Schmidt) into the varied phenomena of "death-feigning." There is a prospect that it may be possible to arrange these in a series. Beginning with the sudden stoppage seen when the animal passes abruptly into a new medium we are led on to the spontaneous catalepsy of some Phasmids, and thence to "animal hypnosis," and to the subtler forms of death-feint in various birds and mammals. On another series it may be possible to arrange a succession of physiological states, such as extreme fatigue, auto-intoxication, cold-coma, sleep, hibernation, and so on to latent life. Further study of latent life is desirable.

Hormones and Chalones.—As was to be expected, the physiological discovery of the significance of the organs of internal secretion (ductless glands) has had its influence on zoölogy. The fact that stimulating hormones and quieting chalones produced by these ductless glands are distributed through the vertebrate body by the blood, and secure an integration hardly less important than that effected by the nervous system, has shed a flood of light on the functional correlation of parts. The idea of a regulative system is far-reaching. (*a*) It is of importance in connexion with growth and development, as studies of the pituitary body show. (*b*) It sheds light on the ante-natal symbiosis characteristic of mammals, for it is known that hormones pass through the placenta not only from mother to offspring, but from offspring to mother, to the great advantage of both. In such ways clues are being discovered which make it possible to understand how the uterus is prepared for the ovum, and how the milk is ready for the new-born mammal. (*c*) The whole dark subject of secondary sex-characters in animals has been illumined by the discovery of gonadial (testicular and ovarian) hormones which activate the development of the distinctive secondary characteristics of male and female. The internal secretions which pass from the ovary of a duck determine the development of feminine characters and the inhibition of masculine characters. The latter normally remain latent, but if the ovary be removed the duck becomes a more or less perfect imitation of a drake of the same race; and this assumption of masculinity may affect behaviour as well as plumage (Goodale, 1916). (*d*) When acid gastric contents reach the duodenum there is produced in the intestinal wall a hormone which the discoverers (Bayliss and Starling, 1902) called "secretin"; it is carried by the blood to the pancreas, where it provokes a greater production of digestive ferments which are carried by the pancreatic duct to the duodenum, there to discharge their appropriate function. It is for the zoölogist to discover similar automatic regulative processes; and the quest for hormones in invertebrates, suggested by the work of J. F. Gaskell (1914) on the leech, is very attractive. Such an everyday incident as the cat's hairs "standing on end" when surprised by a dog admits of obvious interpretation in terms of the hormone of the suprarenal bodies.

Ecology.—The old "natural history" cultivated a profitable field—the study of the life of organisms in its interrelations, as it is lived in wild nature. Logically classified, it was an enquiry into "the higher physiology," that interplay of organisms, where account has to be taken of more than the internal economy of the individuals concerned. For if physiology be the study of the organism in its dynamic relations it must include the serious study of the intact creature in its natural surroundings, as one of a pair and of a family, as a member of an association and of a fauna. This ecology (or "bionomics") is the oldest department of the science and it is indispensable; the question is how that of to-day differs from Réaumur's or Gilbert White's.

(*a*) Largely through Darwin's influence, there has been an increasing recognition of the complexity of interrelations amid which the organism lives and works. The recognition of the correlation of organisms has been not less profitable than the recognition of the correlations of organs within the body. It is not merely that, for completeness' sake, insects must be studied in relation to the flowers they visit, and the bird in relation to its mate and family, its "territory" and migrations—there is yet more implied in the modern insistence on the concept of "the web of life." As Darwin indicated, it deepens our understanding of natural selection in the struggle for existence. "For in the gradually evolved and ever complexified system of interrelations there is a sieve of extraordinary delicacy, which discriminates between even minute variations to the plus or minus side" (Thomson, 1919, p. 95). Moreover, part of the difficulty of understanding the frequent and general progressiveness of evolution (in the direction of increasing differentiation and integration) may be found in the gradual complexifying of the web of life, *e.g.* in the linkages between flowers and their insect-visitors. "There is established an external system of interrelations which is always becoming more intricate, and this forms the sieve by which variations are sifted. There has been an evolution of sieves which partly accounts for the progressive evolution of the sifted" (Thomson, 1919, p. 96). The importance of recognizing animate interrelations is familiar.

(*b*) Modern "natural history" has become frankly evolutionary. The "*Souvenirs Entomologiques*" of Henri Fabre must be taken as the crowning work of the older school; unquestionably an achievement of genius when we consider the patience, ingenuity, and intimacy of its observation, behind which lay an emotional sympathy, bringing, at times, even scientific reward, and yet an achievement robbed of its fruition by the observer's refusal to take Darwinism seriously, and by an unprofitable pessimism as to the possibility of any evolutionary interpretation whatsoever. A more progressive note is sounded in modern work permeated with the evolution-idea, such as Wheeler's studies on ants or Roubaud's on wasps.

(*c*) A third change, and a welcome one, is that "natural history" is becoming more analytic—which will eventually mean a fresh synthesis. Thus the study of the migration of birds, for so long rather fumbling and anecdotal, has entered on a new phase of precision. This may be illustrated by Dr. Eagle Clarke's careful analysis (1912) of enormous masses of observational material, the utilization of a new ringing method (Landsborough Thomson, 1921), and by the precise experiments of Watson and Lashley (1915) on the homing of terns at the Tortugas.

Another illustration will be found in the still incipient endeavour of the shrewder observers to take advantage of the results of the modern study of animal behaviour. The older naturalists read the man into the beast without let or hindrance or else reacted to the other extreme of regarding animals as automata. It is now recognized as desirable that an attempt be made to describe behaviour with reference to definite categories, of intelligence, instinct, individual habitation, association, tropisms, reflexes, and the like. To mention what may seem at first sight a small matter, Miss Frances Pitt (1920), in studying the well-known method the thrush adopts of breaking snails' shells on a stone-anvil in the wood, takes the trouble to experiment with a young thrush to see whether the behaviour is instinctive or whether it has to be learned. Her account of the bird's gradual learning, by a "trial and error" method, is of real scientific value.

Luminescence.—There is definite progress to record in the study of many animal activities which stand somewhat apart from the everyday life of the body. The inquiry into the nature of animal luminescence is a case in point (see Harvey, 1920). Luminescence is known to occur in no fewer than 36 orders of animals; it is a chemical phenomenon that may manifest itself after life has ceased (bacteria apart); it may be produced *in situ* in the cells in which the photogenic substance is produced, or there may be a luminous secretion that exudes over the surface of the body and forms a glimmering trail in the sea or on the ground; it may have its seat in more or less elaborate luminous organs which often show a remarkable convergence to eyes (the chemiphotic approaching the photochemical). The production of the animal light may be continuous or it may be periodic and even rhythmic. In "fire-flies" the light consists wholly of visible rays, with no infra-red or ultra-violet, and none of the energy is lost in the form of heat. It is practically perfect "cold light." The matter has been probed furthest in Lampyrid beetles, in the small crustacean Cypridina, and in the boring bivalve Pholas, and the result has been to confirm the contention of Raphael Dubois (1887) that a protein substance, luciferase, acts, in the presence of oxygen and water, on another substance, luciferin, which has much in common with peptones. The luciferins of different luminescent animals are different, but all luciferins have a good deal in common, and it is the same for the luciferases. It is probable that luciferase is an organic enzyme or catalyst which oxidizes luciferin, or accelerates its oxidation, with the result that light is produced. It is interesting that the chemical physiology of animal light has outrun its ecologic interpretation. In some cases the light may be no more than the byplay of some physiologically important chemical change, but a biological interpretation is demanded when there is an elaborate luminous organ or a definite arrangement of organs. Unfortunately, however, the interpretations suggested remain more or less of a speculative nature. The light may scare away intruders; it may be a lure attracting booty; it may illumine the surroundings; it may facilitate the recognition of kin; and it may serve as a sex-signal in mating. What seems a physiological byplay has thus been utilized and elaborated in quite different directions.

Tropisms.—On the inclined plane of animal behaviour tropisms occupy a place somewhat above ordinary reflex actions, and it is certain that an understanding of the ways of animals is impossible unless the rôle of tropisms is duly appreciated. This need not involve an attempt to coerce behaviour of a higher order (*e.g.* implying intelligent control) into categories manifestly too small—an exaggeration which sometimes seems to attend the brilliant experimental work of Jacques Loeb (1918). Yet tropisms must be taken account of, and Loeb has shown that they are obligatory or forced movements of the animal as a whole, which more or less automatically secure physiological equilibrium in relation to outside stimuli, such as light or heat, gravity or electricity, diffusing chemicals or water currents. When a moth, constitutionally adapted to nocturnal activity, but positively heliotropic none the less, comes in its flight within the sphere of influence of a lit candle, and has one eye much more illumined than the other, owing to the direction in which it happens to be flying, more intense chemical processes are set up in the more illumined eye. This means that on the illumined side there is a relative increase in the mass of certain chemical products. But stimulations are always passing from the brain of the flying moth to the contracting muscles, and if the physiological symmetry of the brain has been disturbed by the unequal illumination of the eyes, the muscles on the more illumined side are thrown into a state of stronger tonus, with the result that they respond more forcibly to nervous stimulation, and therefore turn the head and body of the moth directly toward the candle near which it is flying. "As soon as the plane of symmetry goes through the source of light, both eyes receive again equal illumination, the tension (or tonus) of symmetrical muscles becomes equal again, and the impulses for locomotion will now produce equal activity in the symmetrical muscles. As a consequence, the animal will move in a straight line to the source of light until some other asymmetrical disturbance once more changes the direction of motion" (Loeb, 1918, p. 14). When elvers go straight up stream against the current, when small crustaceans crowd to the shaded or to the warmer corner of the aquarium, when newly hatched turtles make for the sea, we have to do with tropisms. In many cases, however, even among the lower animals a higher note seems struck. For Jennings (1906) there is trial after trial of different movements, and there is a selection of that which brings relative satisfaction; an interpretation to which this observer adheres, despite criticism from Loeb.

Zoölogical Parasitology.—Progress in the study of parasites has been a very marked characteristic of the zoölogical work of recent years. This is congruent with the increased attention that has been given to the broad fact of the inter-relations between organisms, and details of the important medical results achieved will be found in the separate medical articles on this or that form of parasitic disease (*e.g.* MALARIA, SLEEPING-SICKNESS, BILHARZIOSIS, etc.). The tracking of the life-history of parasites is but a particular instance of this kind of investigation, with a special interest when the parasites affect Man and his domesticated animals and cultivated plants. Good examples are not far to seek—the malaria organism (plasmodium), and the mosquito's share in its development and dissemination; the trypanosomes that cause sleeping-sickness and other diseases, and the tsetse flies and other insects implicated in their transmission; the hookworms (*Ankylostoma* and *Necator*) which depress the vitality of enormous numbers of the inhabitants of tropical and sub-tropical countries; and the species of the formidable Bilharzia (*Schistosomum*) whose life-history, discovered by Dr. Leiper, is bound up with freshwater snails. Apart altogether from the immense practical importance of these investigations, they are full of theoretical interest. Thus, to take the two kinds of Bilharzia in Egypt, one species, *Schistosomum mansoni*, has ova with a lateral spine, is chiefly associated with the snail Planorbis, and produces intestinal bilharziosis; while the other species, *S. Hæmatobium*, has ova with a terminal spine, is chiefly associated with the snail Bulinus, and produces renal bilharziosis—obviously a fine instance of specificity. As several human diseases have now yielded to attack from the zoölogical side, it is not over-sanguine to consider whether there may not be a much-desired clue in the fact that cancer of the stomach of the rat is produced by a nematode whose carrying host is the American cockroach. Very interesting and somewhat surprising is the discovery (see Rennie, White, and Harvey, 1921) that the so-called "Isle of Wight disease" in hive-bees, which spread in a few years all through Britain, is causally connected with the presence of a minute mite, *Tarsonemus woodi*, in the cavity of two anterior tracheæ. More familiar is the demonstration of the fact that true pearls may have a parasitic origin.

(C) EMBRYOLOGICAL ZOÖLOGY

While descriptive morphological embryology continues on lines which require no vindication—we have only to think of recent work on the development of the marsupials and armadillos, of Dipnoi and Echinodermis—it is instructive to notice, in the volumes of the *Journal of Experimental Zoölogy* how many embryological investigations sound the experimental note. There has been great activity not only as regards what is often called "experimental embryology" in the narrow sense, where germ-cells and developing ova are subjected to artificial stimuli, constraints, and disturbances, but also as regards later stages of embryonic life. Here might also be considered the observations of Carrel and others on the prolonged life of pieces of tissue in artificial cultures, and the important researches of Ross Harrison on the growth of a nerve fibre. It is of zoölogical as well as physiological interest that this growth should be closely comparable to the protrusion of a pseudopodium by an amœba.

Experimental Embryology.—In illustration of what may be included under the term "experimental embryology," we may take Godlewski's remarkable cases of the fertilization of an ovum with the spermatozoon of an unrelated animal. A fragment of the ovum of *Echinus*, bereft of a nucleus, was fertilized by the spermatozoon of the Crinoid *Antedon*. The segmentation, the gastrulation, and the formation of the mesenchyme followed the type of the maternal parent, which seems to show that the cytoplasm may count for much in inheritance. The ova of *Sphaerechinus* were fertilized by the spermatozoa of the Annelid *Chaetopterus*, and the union of the two nuclei was observed. But before the nucleus divided, the chromatin from the spermatozoon was ejected, as if the incompatibility was too pronounced. In another set of experiments Godlewski altered the composition of the sea water containing sea-urchin ova, and then introduced the spermatozoa of *Chaetopterus* or of the mollusc *Dentalium*. The result was development, which was followed to the Pluteus stage. The further experiment was made of adding spermatozoa of the sea-urchin to those of the worm or of the mollusc, with the result that no development occurred. Godlewski speaks of the antagonism of the unrelated spermatozoa, and Bohm (1921, p. 27) calls attention to the possible analogy with the antagonistic action of serums derived from distantly related species. Nothing, he says, is more fruitful in biology than the bringing together of two sets of facts which appear at first sight to belong to very different provinces. Enough has been said to indicate the interest of this relatively young inquiry.

Artificial Parthenogenesis.—It was discovered independently by Yves Delage and by Jacques Loeb that ova which do not normally show parthenogenetic or aspermic development may be induced to do so by very varied artificial stimulation. The prosecution of this kind of experiment has made it plain that there are usually two distinct events—the first, a stimulation which induces cleavage but is apt to lead to disintegration; the second, a counteracting or corrective influence which steadies development, acting as a life-saving brake. Thus, to take one of Loeb's methods, if the eggs of the sea-urchin are subjected for a short time to the influence of some fatty acid like butyric acid, cleavage sets in, but it is then necessary to place the ova in hypertonic sea water to keep them on lines of safety. Or, to take one of Delage's methods, the ova may be first activated by a combined application of tannin and ammonia, and then replaced in ordinary sea water. Or, to take Bataillon's method, if the eggs of the frog are first activated by pricking them with a very fine stilet of glass or platinum, and then steadied by washing them with blood, which allows of the entrance of a corpuscle, normal development may follow, and several young frogs, of both sexes, have been reared.

Experimental Teratology.—A good instance of the modern endeavour to supplement the study of form by the study of function, morphology by physiology, may be found in the development of experimental teratology. Accurate descriptions of monstrosities and abnormalities are valuable, but their significance is increased when some light can be thrown on how the peculiarities in question came about. It has been shown that defective nutrition of the embryo, especially at critical stages, may lead to "arrests of development," such as harelip in Man. It has been shown that conditions which bring about local slowing or quickening of the rate of development may result in abnormal asymmetry, coalescence, separation, and the like. But a more precise illustration may be useful. Dr. E. I. Werber (1916) subjected the developing eggs of the American minnow, *Fundulus*, to various reagents, such as butyric acid, which brought about numerous monstrosities in eyes and ears, nostrils and mouth, heart and fins. The chemical intrusion seemed to dislocate and partially dissolve the germinal material, especially toward the head end of the embryo. As one of the results of a disturbance of carbohydrate metabolism is the production of butyric acid, the theory almost suggests itself that a poisoning of a mammalian mother's constitution with butyric acid might account for histolytic monstrosities in the offspring. Werber has also shown that a breaking-up (blastolysis) of the optic club brings about the formation of many lenses. The optic club fragments exert on various parts of the skin which would not naturally form a lens a specific effect, like that of a ferment, which induces multiple lens-formation.

Sex Determination.—Without encroaching on the article SEX, we may notice the general fact that the inquiry has become wholesomely experimental along several distinct lines. (*a*) The striking work of Geoffrey Smith and Potts, following Giard's pioneer observations, has shown that the castration of a male crab by a Rhizocephelan parasite induces an expression of latent feminine and female features. The male put on abdominal limbs like those of a female, and the gonad showed ova; and Smith's theory, stated briefly, was that the parasite alters the composition of the male's blood to or toward a female condition, and that this is naturally followed by the development of latent female secondary characters, or by the regeneration of an ovary instead of a testis from the indifferent residue that remains at the end of the infection. Metabolism-stimulation activates latent sex characters. Using the terminology of *The Evolution of Sex* (Geddes and Thomson, 1889), Geoffrey Smith summed up: "This adaptive regulation consists in the production of at least a partially female condition of anabolism as opposed to a wholly male condition, the female condition being preponderantly anabolic or conservative, as opposed to the katabolic male condition, and, by this change from a katabolic to a more anabolic condition, the animal can withstand better the drain on its system increased by the parasite." (*b*) Many experiments show that latent masculine characters in a female animal, or latent feminine characters in a male, may be activated by changes in the internal secretions of the gonads. (*c*) Baltzer (1914) has shown that if the very young sexually indifferent larvæ of the worm *Bonellia*, just hatched from the eggs, happen to become attached to the proboscis of an adult female, they develop into males; whereas, if they fail to attach themselves and sink into the sand or mud, they develop slowly (almost exclusively) into females. But the story does not end here. Baltzer helped some of the very young free-swimming *Bonellias* to attach themselves to the proboscis of a full-grown female; those that he left attached for a very short time developed into almost perfect females; those that he left attached for a long time became perfect males, if such degenerate pigmies can be called perfect; while those that he left for intermediate periods showed practically all grades of inter-sex. These fine experiments point to a conception of sex as plastic, reversible, constitutional, and quantitative. (*d*) The recent work of Oscar Riddle has made it practically certain that pigeons produce two kinds of eggs which differ in the rate or intensity of their chemical processes. One kind of egg has a low storage capacity, a high oxidizing capacity, and a relatively higher intensity of metabolism; and such a type of egg develops into a male bird. The contrasted type of egg develops into a female bird, while an intermediate type of egg, produced for instance early in the season, will develop into a female bird with an admixture of masculine features. Femaleness in an egg is associated with high storage capacity, less intensity of metabolism, lower percentage of water, higher total of fat and phosphorus, and greater energy value in the yolk as determined by the calorimeter. It is of further interest to notice that analyses of the blood of adult cocks and hens show a persistence of constitutional differences analogous to those which mark the two kinds of ova. These experiments furnish a corroboration of the thesis, suggested in 1889 by Geddes and Thomson, that femaleness is associated with a relative preponderance of constructive up-building, or anabolic processes, and conversely for maleness.

It need hardly be said that what seems to have been made very probable for the pigeon need not hold good in the same way for other animals. Thus in frogs it is probable that all the eggs are alike to begin with, but that there are two kinds of spermatozoa, one with and the other without a special sex-chromosome. If the eggs are quite normal at the time of fertilization the determination of the sex depends on whether the egg is fertilized by a sperm with the special sex-chromosome (which results, it is believed, in a female offspring), or by one without the sex-chromosome (which results, it is believed, in a male offspring). Even clearer cases have been worked out in insects by Prof. E. B. Wilson and others. It does not follow that the physiological condition of the ova is of no importance, for over-ripe frog's ova tend to develop into females. Moreover, the presence of the special sex-chromosome may be associated with certain constitutional differences in the germ-cell—an index as much as a cause.

Regenerative Capacity.—Prof. T. H. Morgan's critique (1901) of Weismann's theory of regeneration as an adaptive phenomenon—occurring in those two animals and in those parts of animals which, in the natural conditions of life, are particularly liable to non-fatal injury, has been followed by interesting experiments and observations. It seems that regeneration often follows the experimental excision of a part which could rarely, if ever, be lost in the ordinary conditions of life. In such cases it seems gratuitous to search for some far-fetched evidence of adaptiveness. It seems more reasonable to regard the regrowth of an excised portion of the body as a special exhibition of a power which is always in operation in the repair of certain tissues, such as the glandular epithelium of an intestine. On the other hand, this will not suffice when there is definite prearrangement establishing a weak breaking plane, as in a crab's claw or a lizard's tail. The fine work of Dr. J. H. Paul (1915) has shown in the case of the shore-crab (*a*) the definite prearrangements at the breaking plane; (*b*) the muscular arrangements that secure the rapid surrender of a captured or broken limb; and (*c*) the presence of a two-flapped membrane, pierced by nerve and blood-vessel, which automatically folds over the wound and prevents hæmorrhage. To this has to be added the way in which the new limb is fully formed within the scar before it is jerked out after a moult. When it is known that a breakage of a leg by a dislodged stone is a common accident among shore-crabs, the adaptiveness of the special arrangements seems more than plausible.

Senescence and Rejuvenescence.—The study of development in the widest sense includes the phenomena of senescence as well as those of adolescence, and there is no doubt that progress is marked by such studies as those of C. M. Child (1915). On an experimental basis, mostly in regard to planarian worms, Child rests the conclusion that as an organism differentiates, it ages, for there is a necessary accumulation of relatively inactive and stable constituents in the colloidal cytoplasmic substratum, and this accumulation involves a decrease in the rate of metabolism, as the flow of a stream may be slowed by what it deposits in its bed. There are indeed counteractive processes of reduction, removal, and de-differentiation, when the metabolic stream may be said to erode its bed instead of depositing more materials. Periods or it may be crises (often seasonal) of rejuvenescence alternate with periods of senescence. Sooner or later, however, rejuvenescence lags and senescence prevails. Exceptions, as Weismann and others suggested, are to be found in the Protozoa, where recuperative rejuvenescence is wellnigh so perfect that it implies bodily immortality. The question rises whether a similar evasion of natural death may not occur also in some simple Metazoa such as hydroid polyps and planarian worms.

In the same connexion may be noticed the observations of L. L. Woodruff on pure-line (all descended from one individual) cultures of the slipper-animalcule *Paramoecium*, which multiplies rapidly by fission. In 1915 he reported on a stock which had kept agoing for over eight years, 5,250 or more asexual generations. There had been no conjugation (which does not occur between members of a pure line) and no artificial stimulation; the secret of continued vitality, so different from the aging observed by Maupas, being abundant food and a thorough removal of waste products from the water. Very suggestive is the periodic, approximately monthly, occurrence of *endomixis* observed by Woodruff and Erdmann (1914), a disruption and reorganization of the nuclear apparatus, similar to that which precedes conjugation in natural conditions. It appears to serve as a process of rejuvenescence, and it serves, perhaps, like conjugation, to provoke variability.

Another correlated idea, to which the work of some palæontologists has pointed, is that one type of animal may differ from another in the relative length of the chapters in the life-history. The pre-natal chapter may be long in one, *e.g.* elephant, and very short in another, *e.g.* opossum; the larval period, long drawn out in a crab, is telescoped down in the crayfish. The young storm-petrel remains many weeks in the burrow; the young mound-bird may run or fly from its birthplace on the day it is hatched. A queen-ant or a queen-bee may live for several years as an adult, while the may-fly sometimes completes its adult life in an evening. The idea is that an arc in the curve of life may be shortened or lengthened in related types, as the adaptive outcome of "temporal" variations. In vertebrate animals it is known that changes in the activity of the glands of internal secretion may hasten or slow down processes of development as well as processes of metabolism.

(D) AETIOLOGICAL EVOLUTIONARY ZOÖLOGY

Heredity.—Prof. T. H. Morgan (1915, p. 7) calls attention to a curious situation which has begun to develop since 1900, when Mendel's law was rediscovered. "The students of heredity, calling themselves geneticists, have begun to draw away from the traditional fields of zoölogy and botany, and have concentrated their attention on the study of Mendel's principles and their later developments. The results of these investigators appear largely in special journals. Their terminology is often regarded by other zoölogists as something barbarous—outside the ordinary routine of their profession. The tendency is to regard genetics as a subject for specialists instead of an all-important theme of zoölogy and botany." It is to be hoped that this severance is only a passing phase, for its accentuation would mean much loss on both sides. "It would be as unfortunate for all biologists to remain ignorant of the modern advances in the study of heredity as it would be for geneticists to remain unconcerned as to the value for their own work of many special fields of biological inquiry." Of clear exposition by investigators like Bateson and Punnett, Castle and Morgan, there is no lack, and the advantages of a synoptic view of the fundamentals of zoölogy as a whole do not need to be enforced by argument.

Referring for due treatment to the article MENDELISM, we may call attention here to three points of general interest. (*a*) In two recently published books we find two extraordinarily discrepant statements in regard to heredity. In one of them Prof. J. P. Lotsy (1916, p. 63) says: "We know absolutely nothing of heredity." In the other Prof. T. H. Morgan (1919, p. 15) speaks of the fundamental aspects of heredity having turned out "so extraordinarily simple," and he elsewhere indicates that the problem of heredity may be regarded as solved. What is the meaning of this startling divergence of statement? The first author had in mind the difficulty of conceiving how all the manifoldness of a well-endowed organism is telescoped down into a microscopic implicit individuality—the germ-cell. The second author was contemplating the precise way in which certain characters of the parents, carried by the chromosomes, are distributed among their offspring. For a large number of cases the modern theory of factors or "genes," located in linear order in the chromosomes, is convincing and clear. (*b*) The list of characters proved to exhibit Mendelian inheritance is always increasing. Many organisms consist, in part at least, of a great bundle of "unit-characters," the factors for which behave in inheritance as if they were indivisible entities. They do not blend or intergrade; they are present in a certain proportion of the progeny; they are normally either there in their entirety or completely absent. It is now recognized, indeed, that one factor or gene may have manifold effects and that one character may be the product of many genes, yet the general idea remains that "the germ-plasm is made up of units that are independent of each other in at least two respects, namely, in that each one may change (mutate) without the others changing, and in segregation and in crossing over each pair is separable from the others" (Morgan, 1919, p. 240). The balance of present opinion seems to be strongly in favour of interpreting all inheritance as Mendelian, but it seems to many not unscientific to say that there is another mode of inheritance which may be described as "blending." There are indeed ways of explaining away blending as due to the coöperation of multiple Mendelian factors, and we are also now being introduced to "Mendelian characters which slowly blend"; but in an article which attempts a general survey it seems just to cite the considered opinion of an experimenter and thinker like Prof. W. E. Castle (1916, p. 218), who writes: "It seems best, accordingly, to attempt neither with Galton to generalize all inheritance as blending nor with Johannsen to treat all inheritance as alternative, but frankly to recognize the existence of two categories of cases distinct in their inheritance behaviour."

Inbreeding and Outbreeding.—Attention has often been directed to the evolutionary importance of inbreeding and outbreeding (exogamy and endogamy), but it is only within recent years that firm foundations have been laid (see East and Jones, 1920). Professional breeders have recognized for a long time that close inbreeding, accompanied by the usual judicious selection and elimination, fixes desirable characters and leads toward a uniform and stable herd; and yet that it has disadvantages, being apt to lead to reduction in vigour, resisting power, fecundity, and even size. Till recently there has been no secure answer to the important question, whether the disadvantageous consequences are actually induced by the close breeding as such, or are simply brought to light and accentuated by it. Experiment has furnished the answer. It has been proved that the close inbreeding of fine stock, associated with the usual selection and elimination, may be persisted in for several generations without any undesirable consequences. Many fine breeds of animals have had very close inbreeding at their beginning; and there seems to be habitual endogamy among bees and ants. In certain forms of "isolation" there is bound to be close inbreeding. Furthermore, it has been shown that the direct result of persistent inbreeding is to segregate within the stock a number of true breeding strains of similar individuals. If there were, at a given time, in a herd, say, four distinct hereditary factors relative to a particular character, such as the colour of the pellage, then if the factors illustrated Mendelian inheritance, the automatic effect of inbreeding would be to segregate four types, pure as regards the particular character in question. But some of the characters which thus become isolated may be undesirable "recessives," seldom seen under ordinary circumstances because they are hidden by their "dominant" counteractives. Thus the undesirable character of albinism, likely to be kept out of expression in conditions of exogamy, is isolated and brought to light in endogamy. These exposed recessives have given inbreeding its bad reputation, but now that the occurrence is understood the elimination of these recessives by the practical breeder becomes a more hopeful task. When the same undesirable qualities occur on both sides of the house, inbreeding tends to their diffusion and exaggeration, yet the result of modern experimenting is clear: "Inbreeding is not in itself harmful; whatever effect it may have is due wholly to the inheritance received" (East and Jones, 1920). But there is another phenomenon, namely the increased "vigour," which often rewards outbreeding. Darwin was strongly of opinion that the gain in constitutional vigour derived from an occasional crossing was a more important biological fact than the loss that often followed close inbreeding, and modern experimenters have confirmed his shrewd judgment. The outbreeding often has advantageous results like those that reward a notable improvement in nurture. There may be an increase in "vigour," resisting power, size, and other good qualities. The reason for this frequently observed "hybrid vigour" is probably to be found in the pooling of diverse hereditary resources of good quality, not in some vague physiological stimulus to the offspring. The general aspects of this kind of inquiry are very important. Thus one of the great trends of organic evolution has been toward the securing of cross-fertilization, though the range of crossing in different cases varies within wide limits. The survival value of this cross-fertilization probably lies in the fact that it promotes variability. It brings about a greater variety of raw material on which selective agencies can work. Similarly, for the wider ranges of cross-fertilization which we call outbreeding, the suggestion arises that this is fundamentally valuable in promoting variability, both in the way of new patterns and fresh vigour. A new light is shed on the process of evolution if we consider the probability that success has rewarded the alternation of periods of exogamy with periods of endogamy. Thus there is a return to the position of Romanes, Gulick, and others, that "isolation" may count for much in evolution. Another ray of light, and a very welcome one, touches the dark problem of sterility. It is suggested by East and Jones that there are two quite different kinds of sterility of diverse origin: (1) Inbreeding tends to sort out homogeneous pure strains and in this sifting out the ability to reproduce may be lost; (2) outbreeding may bring together two germ-cells which are too incompatible, *e.g.* in their chromosomal equipment, to allow of a continuance of the process of germ-cell making. Thus, the *number* of chromosomes in the two parents (*e.g.* horse and ass) may be too discrepant.

Nature or Nurture.—There is a mounting up of evidence as to the influence of environment and function on the developing organism. Just as a certain quantity of food, oxygen, and moisture is essential if the inheritance is to be expressed, so is it with the wider environment of liberating stimuli, and so it is with functioning and exercise. Up to a certain point the chick's lung develops in virtue of the properties resident in the germinal material; beyond that point the development requires that the chick shall breathe. If the word "nurture," which Sir Francis Galton made technical, be used to include all manner of nutritional, environmental, and functional influences, it may be fairly said that modern zoölogy has been marked by an increasing appreciation of the importance of "nurture," as complementary, not antithetic, to the hereditary "nature." As Prof. T. H. Morgan says (1915): "every character is the realized result of the reaction of hereditary factors with each other and with their environment"; and again: "it is a commonplace that the environment is essential to the development of any trait, and that traits may differ according to the environment in which they develop." Gudernatsch has shown that in tadpoles fed on thyroid there is differentiation without growth, while in tadpoles fed on thymus and spleen there is growth without differentiation. Fruit-flies (*Drosophila*) with a peculiar Mendelian abnormality may appear perfectly normal if reared in a dry bottle, but the presence within them of the "factor" for the abnormal character may be demonstrated by rearing their offspring in a damp bottle (Morgan, 1915). Loeb has shown that it is easy to produce a percentage of minnow (*Fundulus*) embryos with defective eyes by adding a very minute quantity of potassium cyanide to the water, or by exposing the developing eggs to low temperature. That is to say, relatively slight environmental changes may so alter the constitution of the developing embryo that a leap is taken in the direction of blindness. Peculiarities in nurtures may enhance or depreciate the hereditary virtues of the organisms; they may induce a modification which serves as a life-saving screen until an innate variation in the same direction has time to establish itself; in cases like mammals and seed-plants the nurtural condition of the maternal parent may influence the vigour of the offspring during the ante-natal symbiosis; changes in nurture, as Tower's experiments (1906, 1918) suggest, may be variational stimuli to the germ-cells.

In regard to the prolonged discussion over the transmissibility of exogenous somatic modifications, the chief need is still for more facts. It is admitted that somatic modifications may have secondary effects on the germ-cells and on the offspring (especially in the case of the viviparous mammals), but this is not the same as the transmission of particular modifications as such or in any representative degree. It is probable, as Agar's experiments (1913) suggest, that long-continued, deeply saturating environmental and functional peculiarities may produce specific substances which enter into the cytoplasm of the germ-cell, or into the embryonic body, and may exert a very definite influence as long as they last; but there is as yet no convincing evidence that the resulting changes grip the constitution permanently. J. T. Cunningham (1908) and others have suggested that particular modifications of an incisive sort may liberate very specific chemical substances, like hormones, and that these may be carried to the germ-cells and accumulate there with subsequent formative (morphogenic) effects. The number of competent zoölogists who hold to some form of Lamarckism should be enough to restrain the impatient from attempting to close this important question or to dogmatize about it. As Prof. E. B. Wilson has wisely said: "In the present defective state of our knowledge we may well grant that there may be many a thing between germ-cell and body that is not yet dreamed of in our biological philosophy." It should be clearly understood that there is no depreciation of the varied importance of peculiarities in nurture on the part of those who are unable to find convincing evidence of the transmission of any exogenous somatic modification. It is incorrect to say that this scepticism leads to the view that individual experience counts for nothing racially. On the contrary, it is through individual experience that germinal variations or mutations are tried and tested.

Evolution Theory.—It would be a contradiction in terms if the Evolution Theory did not evolve. What changes are in process? (1) Some methodological progress has been made in clarifying the concept of organic evolution (see Sorley, 1909). "Organic evolution is a continuous natural process of racial change in a definite direction, whereby distinctively new individualities arise, take root, and flourish alongside of, or in place of, the originative stock" (Thomson, 1920, p. 378). We must also clearly distinguish this from (*a*) the "*genesis*" of a solar system or of a mountain or valley; (*b*) the "*development*" of an organism as an individual; and (*c*) the "*history*" of a human society. (2) Somewhat startling is the suggestion made by Bateson (1914), that we should consider "whether the course of evolution can at all reasonably be represented as an unpacking of an original complex, which contained within itself the whole range of diversity which living things present." "At first it may seem rank absurdity to suppose that the primordial form or forms of protoplasm could have contained complexity enough to produce the divers types of life. But is it easier to imagine that these powers could have been conveyed by extrinsic additions?" In so far as this view means that there is nothing evolved which was not originally in kind involved, that there is nothing of lasting value in the end which was not represented in kind in the beginning, it may be philosophically tenable; but most biologists will probably adhere to the view that organic evolution has been a process of racial epigenesis (not an *evolutio*), with a frequent outcrop of genuine novelties, a synthetic complexifying by creative inventions and by trading with time, rather than an analytic simplification through the removal of inhibitions which allowed the original richness of endowment to express itself with increasing fullness. There was a time when there were no birds or mammals; they came into being, and they were new ideas; they made a new world. (3) While there is practical unanimity among the zoölogists of to-day as to fact of organic evolution, there is a clearer apprehension than there was a generation ago of the detailed difficulties. These difficulties are chiefly of three kinds: (*a*) that little is known with certainty in regard to the pedigree of the great phyla, such as Vertebrates, and as to the way in which the biggest steps were taken, like the passage from Protozoa to Metazoa; (*b*) that there naturally remains much uncertainty in regard to the factors operative in the historic process, and as to the conditions implied in the hereditary or genetic relation between one generation and another; and (*c*) that in regard to the originative factor termed for convenience "variability," our ignorance is still immense. Bateson expressed the mood of many when he said (1913, preface): "That species have come into existence by an evolutionary process no one seriously doubts; but few who are familiar with the facts that genetic research has revealed are now inclined to speculate as to the manner by which the process has been accomplished. Our knowledge of the nature and properties of living things is far too meagre to justify any such attempts." And later in the same work (p. 97), he says: "We have not even an inkling of the steps by which a Silver Wyandotte fowl descended from *Gallus bankiva*, and we can scarcely even believe that it did." (4) It is pessimistic to say that we are no nearer an understanding of the central problem of ætiology, namely the origin of the new, *i.e.* of the variations or mutations which form the raw material of progress or the reverse. The ground has been cleared, though the problem remains unsolved. (*a*) If from the observed differences between the members of the same species there can be subtracted all the peculiarities that are associated with age and sex, and likewise all that can be reasonably interpreted as individually acquired exogenous somatic modifications (directly due to peculiarities of nurture, whether environmental, nutritional, or functional), then we get at the true variations and mutations—inborn, not acquired—endogenous, not exogenous—blastogenic, not somatogenic—expressions or outcomes, not indents or imprints. If there be no convincing evidence of the transmission of extrinsic modifications, as such, or in any representative degree, then they cannot be included, in the first instance at least, among the raw materials for evolution, which are thus confined to what is left when the modifications are subtracted from the total of observed differences. That some at least of this residue, as true variations, are very transmissible, is quite certain. This is the first clearing of the ground. (*b*) But within the large category of inborn changes it seems possible to distinguish minute continuous variations from brusque saltations (Darwin's "sports," Galton's "transilient variations," Bateson's "discontinuous variations," and of course the "mutations" of De Vries; all these being practically the same, though investigated with ever-increasing care). The minute continuous variations, on the other hand, are of the nature of "a little more or a little less," and they show intergrades. Their transmissibility has not been much studied, but has been proved in a few cases. The mutations, whether large or small, are more deserving of the title qualitative; they often show a measure of perfectness from their first appearance, they are without intergrades, they are markedly transmissible, and they are demonstrably at the origin of some new varieties of domesticated animals and cultivated plants. They correspond to, or are implicated in, those "unit characters" of species or varieties which illustrate Mendelian inheritance in their recurrence from generation to generation. Now whether we attend to the continuous or to the discontinuous variations, we can imagine them to arise in the course of the shufflings of the hereditary cards (the chromosomes and their microsomes) during the intricate processes of maturation and fertilization. The reduction or exaggeration of a quality, the dropping out of a character altogether, a "double dose" of a character, a rearranged pattern of hereditary items, may all be interpreted as due to permutations or combinations of hereditary factors or genes during the intricate manœuvres preceding the completion of the fertilization of the ovum. The evidence is very strong that the segregation of the factors of Mendelian characters takes place in the reduction divisions of the germ-cells in the process of maturation. An interesting corroboration has been furnished by the recent experiments of Prof. W. E. Agar (1920) with a parthenogenetic "clone" (pure line) of a hybrid water-flea (*Daphnia pertusa* × *Daphnia pulex*). No reduction divisions occur in a parthenogenetic lineage, and no Mendelian variations occurred. Along with the rearrangements which may be effected in the maturation of the germ-cells—rearrangements in which such phenomena of chromosomal behaviour as "crossing-over" must be taken account of—another possibility of change is afforded at the beginning of each individual life; for there, in all ordinary cases, two very complex systems, of dual origin, become a new unity which normally develops into a harmonious organism. Some modern evolutionists, such as Lotsy (1916), attach great importance to crossing as a cause of variations.

If it be said that such opportunities as have been mentioned could account for nothing more than rearrangements, pluses and minuses, gains and losses, but not for any distinctively novel change, the difficulty of interpretation increases. But even among Mendelians it is sometimes admitted that the factors or genes may themselves change. How this might happen is at present the subject of speculation, but this need not be unreasonable, and it is sometimes backed by the beginning of experiment. Three suggestions may be stated. First, it may be, as Weismann believed, that deeply saturating environmental influences act through the body as variational stimuli on the germ-cells, provoking them to change. It is known that changes in a cell's environment may cause disturbance of the process of cell-division, and this, as Bateson has pointed out, may be the *fons et origo* of germinal variation. Apart from demonstrable external stimuli, it is possible that the chromosomes of the germ-cells may change suddenly like mutating Bacteria, or may undergo age changes, or may exhibit periodic reorganizations, like the remarkable endomixis that occurs about once a month in a "pure line" of *Paramoecium*, or may show rejuvenescence-changes, like those which occur in some cases of regeneration and asexual multiplication. It must be borne in mind that the chromosomes are very complex living bodies, and that differences between species are sometimes the expressions of visible differences in the chromosomes, as Gates (1915) has shown in the case of *Oenothera*.

The Mendelian conception of unit-characters, whose germinal factors or genes behave like discrete unities in inheritance, neither blending nor fragmenting, has had to be corrected by fuller knowledge. Thus Prof. T. H. Morgan (1919) lays emphasis on the conclusions: first, that each gene may have manifold effects on the organism; and second, that every part of the body, and even each particular character, is the product of many genes. The phenomenon of linkage also shows that chains of genes may keep together in inheritance instead of there being free assortment of the various links in the chain. Thus from the idea of extreme particulateness which Mendelism at first suggested, there is a return toward the Darwinian idea, on which Sir E. Ray Lankester, especially, has laid emphasis, of the correlation of variations. Several apparently independent changes may be diverse outcrops due to one disturbance. A change in some particular kind of metabolism may reverberate through the whole body. Another idea of considerable importance is that of temporal variations, that is to say, alterations in the "time" or rate or rhythm of certain metabolic processes, or in the duration of particular phases in the life-cycle. Many changes of great adaptiveness are interpretable as lengthenings out or shortenings down of particular chapters in the life-history. In the influence of internal secretions in backboned animals there is a known method whereby these variations in tempo might be brought about; and it is worthy of notice that in Sebright poultry, where the cocks are hen-feathered, an endocrine secretion depends on a genetic factor inherited in the same way as are other genetic factors (see T. H. Morgan, 1919, p. 243).

Many palæontologists, with remarkable concurrence, have reached the conclusion that an evolving line often changes not by discontinuous steps (saltations or abrupt mutations), but by continuous minute steps. This is well illustrated by Dr. Rowe's study of the species of the sea-urchin *Micraster* in the chalk of S.E. England and just as well by the evolution of Mammalian teeth. Speaking of Tertiary mammals, Dr. W. D. Matthew writes (1910): "The more complete the series of specimens, the more perfect the record in successive strata, and the nearer the hypothetic centre of dispersal, the closer do we come to a phyletic series whose intergrading stages are well within the limits of observed variation of the race."

Whether the individual changes in the past were continuous and minute transitions, like those which Dr. Duerden finds occurring to-day in the ostrich, or were discontinuous and minute saltations, or both, no one can tell; and the question does not seem very important. Even in ordinary growth what seems by one mode of measurement continuous, may be shown by another and finer method to progress rhythmically, even to seeming fits and starts. But the palaeontologist tells us more; he can arrange his species in series in a time-succession. "There is not merely transition, but transition in orderly sequence, such as can be represented by a graphic curve of simple form" (Bather, 1920, p. 73). Moreover, in this seriation there may be gradual increase or decrease as in the number of spines or tubercles, or in the size of horns or digits; and this gives the palæontologist an advantage over the neontologist, inasmuch as he can point to progression or retrogression extending throughout millenia. It is for the neontologist to assist the palæontologist by pointing to determinate variation occurring in generations of living animals; for it may have been by such mode of variability that the seriations of the rock record were produced (see Bather, 1920, p. 74).

There is a growing body of evidence in support of the view that variation is often a very definite kind of organic change. This cannot be assured from the movement of a species as such; for the inferred orthogenesis might be the outcome of selection, sifting out those best adapted to a particular environment which might also be changing in a definite direction, say of increased salinity or aridity. But when large numbers of specimens are procurable, and can be studied in successive years (or centuries in strata), the non-occurrence of variations off the line is significant. If this be so, it is not necessary to look for any particular impulse from within to account for the definiteness. It may be enough to recognize that the unified organization, stereochemical in part at least, must to a certain extent predetermine what variations (other than pathological disintegrations) emerge.

Here may also be mentioned the suggestion of dichotomous variation, as between types of passive and active (anabolic and katabolic) preponderance, and as resulting in contrasts of allied forms, like bee and wasp, moth and butterfly, sheep and goat, and to larger differences as of reptile and bird, even of plant and animal, female and male. (*See* P. Geddes, VARIATION, *E.B.*, 9th ed.; and Geddes and Thomson, *Evolution*, 1911.)

Natural Selection.—The zoölogist of to-day has to face the reconciliation of two sets of facts as regards natural selection. In a few cases, such as Weldon's crabs, it has been demonstrated in actual effective operation, and Cesnola's test of the protectiveness of colouring by tethering green mantises with silk threads on brown herbage and brown variants on green herbage, gave vividly convincing results. Working with "hooded rats," Prof. W. E. Castle selected simultaneously in two opposite directions; and produced one race black all over except for a white patch of variable size underneath, and another race white all over except for the top of the head and the back of the neck, which are black. On the other hand, it has been shown by Johannsen, de Vries, Jennings, Pearl and others that selection does not count for much within pure lines or inbred stocks. Within an inbred race of guinea-pigs, for instance, a *ne plus ultra* may be reached, beyond which no amount of selection is of any avail within the period of experimentation. Abundant "fluctuations" of a quantitative sort occur, but these cannot be used as a basis for selection since they are not transmissible. They are probably for the most part of the nature of somatic modifications.

The estimate of the scope of natural selection is plainly affected by the view taken in regard to the raw materials supplied. If a new position of structural or functional equilibrium is reached by mutational abruptness, there is no need in such a case to burden natural selection with the task of gradually accumulating minutiæ. On the other hand, due attention should be given to de Vries's declaration (1909, p. 83): "Thus we see that the theory of the origin of species by means of natural selection is quite independent of the question, how the variations to be selected arise? They may arise slowly, from simple fluctuations, or suddenly, by mutations; in both cases natural selection will take hold of them, will multiply them if they are beneficial.

and in the course of time accumulate them, so as to produce that great diversity of organic life, which we so highly admire." In the same way, if variations are in large measure definite, natural selection has not to sift out the serviceable from a large casual crop, but it still has its work to do.

The trend of recent zoölogy seems to be toward a confirmation of the central idea in Darwinism—the selection of the relatively fitter variants in the struggle for existence. Thus there is no longer serious difficulty in meeting the criticism that slight initial variations could not have survival value, or that they would be swamped by intercrossing. There is also a deeper appreciation of the fact, on which Darwin so often laid emphasis, that selection is a manifold and often subtle process of sifting. Thus lethal selection must be distinguished from reproductive selection, and the operation of selective processes at many levels, even among germ-cells, must be recognized. The ubiquitous sifting is anything but automatic, since animals often select their environments, instead of being selected by them, and may be in various ways active agents in their own evolution. Natural selection operates in reference to an intricate web of life, and thus a nuance—a shibboleth—may have survival value. There has been an evolution of the sieves as well as of the sifted, for natural selection operates, generally speaking, in relation to an ecological *Systema Naturae*—or system of inter-relations—which has been increasingly elaborated through the ages; and this (along with what may be called organismal momentum) is probably part of the explanation of the *general* progressiveness of organic evolution.

Sexual Selection.—No part of Darwin's theory has met with a more critical reception than his theory of sexual selection; and yet it often has weathered the storm. (*a*) When there is forceful competition among rival males there is some evidence that the less well equipped with weapons will have fewer and less vigorous offspring, or it may be, none at all. This will operate like ordinary natural selection. (*b*) The same may be said of those masculine characters which aid males to find, pursue, and catch the female. (*c*) Sexual selection meant, for Darwin, all the processes of sifting that occur in connexion with mating and pairing, whether the female held the sieve or not; but he firmly believed that in a certain number of cases there is definite preferential mating on the female's part, the more attractive males having a reproductive advantage. While Prof. T. H. Morgan has given, in his *Evolution and Adaptation* (1903), no fewer than 24 reasons for rejecting the theory of sexual selection, many zoölogists believe that the reality of some measure of preferential mating has been placed beyond doubt by the data furnished by Darwin himself (1871) and by the Peckhams (1889), Groos (1898), Cunningham (1900), Pycraft (1913), Julian Huxley (1914), Whitman (1919) and others. It is not necessary to suppose that the female chooses "the best of the bunch" from amongst her unequally endowed suitors; it will be enough if she remains unresponsive to the solicitations of certain of the less generously endowed, who do not arouse her emotional interest to the requisite pitch. This is in agreement with Darwin's own remark about the female bird: "it is not probable that she consciously deliberates; but she is most excited or attracted by the most beautiful, or melodious, or gallant males." It is not necessary to credit the female with a capacity for appreciating slight differences in decorativeness or musical talent or lithesomeness, or with a consistency in allowing these nuances to determine her preferential mating, season after season, generation after generation. It is enough, as Lloyd Morgan says, that "the hen selects the mate which by his song or otherwise excites in greatest degree the mating impulse. Stripped of all its unnecessary æsthetic surplusage, the hypothesis of sexual selection suggests that the accepted mate is the one that most strongly evokes the pairing instinct." But this does not mean that the details do not count; it is rather that each is contributory to a general impression. Each has its effect; but synthetically, not analytically. "Even when the female seems to choose some slight improvement in colour or song or dance, the probability is that she is simply surrendering herself to the male whose *ensemble* has most successfully excited her sexual interest" (Geddes and Thomson, *Evolution*, 1911, p. 172).

It is interesting to inquire into the racial justification of the courtship habits—often so prolonged, elaborate, and exhausting. According to Groos (1898, p. 242) the coyness of the female, which has to be overcome, is an advantageous check to the impetuous violence of the sex impulse. According to Julian Huxley the elaborate ritual of the Great Crested Grebe serves to forge an emotional bond. "The courtship ceremonies serve to keep the two birds of a pair together, and to keep them constant to one another." Pycraft (1913) also insists on the need for psychological interpretation. Karl Pearson suggests that pronounced and persistent preferential mating within a species being differentiated into types may lead to a physiological and psychological "isolation" (*i.e.* narrowing of the range of intercrossing), and thus to "the relative or absolute mutual sterility of the differentiated types, *i.e.* to the origin of species" (*Grammar of Science*, 2nd ed. 1900, p. 418). Finally, it may be noted that the courtship habits must have played an important part in the evolution of sense (*e.g.* the aesthetic sense), and even of mind. This has been well illustrated by S. J. Holmes (1916) in connexion with the evolution of the voice, which began as a sex-call in amphibians, but gradually broadened out as parental summons, infantile cry, and kin-signal, until it became the means of reasoned discourse. That after the last returns the first is obvious in every serenade.

Naturalist Travellers.—From Darwin's *Voyage of the "Beagle"* (1844) and Wallace's "*Travels on the Amazon*" there has been a fine succession of the tales of naturalist travellers. This has been sustained in the last 20 years, and with increasing specialization. In the older narratives there is naturally much that is not definitely zoölogical; in many of the newer the zoölogical or biological note is dominant. We may instance such books as Alcock's *Naturalist in the Indian Ocean*, Hickson's *Naturalist in the Celebes*, Hudson's *Naturalist in La Plata*, Saville-Kent's *Naturalist in Australia*, Semon's *In the Australian Bush*, and Siedlecki's *Java*.

Faunal Evolution.—A line of zoölogical research which has had some fine expressions in recent years is that of constructive faunistic interpretation, following the lead of Wallace in his *Island Life* (1880). One of the best examples is Dr. James Ritchie's *Influence of Man on the Animal Life of Scotland* (1920). Neolithic man penetrated into a country which, after the clean sweep of the Great Ice Age, had been restocked with animal life from the south of England and from the Continent. There were then no domesticated animals, nor aliens like rabbits and rats. But there were elk and reindeer, wild cattle, wild boar, perhaps wild horses—a fauna of large animals on which lynx, brown bear, and wolves levied toll. This post-glacial fauna was the capital with which prehistoric man started, to which he added various imports from abroad, and which at times he likewise taxed heavily. With fine zoölogical scholarship Ritchie traces the changes brought about by domestication, by the destruction of beasts and birds of prey, by deliberate protection in various interests, by the intentional and unintentional introduction of new animals from other countries, and by the cutting down of forests, the spread of cultivation, and other human interferences. While more species have been introduced into Britain than have been exterminated (the fauna having substantially gained in numerical strength), there has been a falling off in what may be called faunistic quality. For many masterly creatures have been replaced by elusive vagrants, and giants by pigmies. "We have, in effect, lost more than we have gained; for how can the increase of rabbits and sparrows and earthworms and caterpillars, and the addition of millions of rats and cockroaches and crickets and bugs, ever take the place of those fine creatures round the memories of which the glamour of Scotland's past still plays—the reindeer and the elk, the wolf, the brown bear, the lynx, and the beaver, the bustard, the crane, the bumbling bittern, and many another, lost or disappearing?" (p. 497). We have singled out this book as an outstanding instance of a kind of zoölogical investigation which is interpretative as well as observational, synthetic and constructive as well as analytic. In its vivid realization of the correlation of organisms, this "study in faunal evolution" continues the tradition of Darwin.

Mechanism and Vitalism.—Coming finally to the "*Magnalia Naturae*," and the diverse attitudes of modern zoölogists to these, as in the long controversy of mechanists and vitalists, we cannot yet say that substantial conclusions have been reached. The conflicts between mechanistic and vitalistic interpretations, between the purely physiological (*i.e.* apsychic) and the psychobiological descriptions of behaviour continue with undiminished vigour. Yet there is progress in the fact that the questions at issue are being defined with increasing precision. (*a*) Everyone allows that there is a chemistry and a physics of the organism; that a chemical and physical (*i.e.* theoretically mechanical) description can be given of much that goes on in the living body; that the chemical and physical analysis of the animal has yielded very important results; and that this kind of description will certainly extend its scope. (*b*) It is widely though not unanimously held that there is little help in the hypothesis that a special form of energy ("vital" or "biotic") comes into operation in organisms, and is convertible into equivalent quantities of other forms of energy. For no one has demonstrated this specific vital energy, much less measured its intensity. As the tendency of science is to greater simplification of the forms of energy, we must agree with Bayliss (1915, p. 31) that "it seems somewhat retrograde to assume a new form of energy, especially as there is no urgent necessity for it. The resources of the known forms of energy are not altogether exhausted." (*c*) Many physiologists occupy the position of Claude Bernard: "There is in reality only one general physics, only one chemistry, and only one mechanics, in which all the phenomenal manifestations of nature are included, both those of living bodies and those of inanimate ones. In a word, all the phenomena which make their appearance in a living being obey the same laws as those outside of it" (*La Science Experimentale*, 1878, p. 116). (*d*) There is, however, a growing body who hold to what may be called methodological vitalism. Without presuming to set limits to the extent to which chemical and physical descriptions may be given of what occurs in a living animal, and without assuming that the concepts of physics and chemistry are stationary (which they certainly are not), it is urged that up to the present the chemico-physical interpretation remains inadequate. For there has not been given any exhaustive physico-chemical description of any total vital operation, such as the contraction of a muscle, still less of any complex case of animal behaviour. And as to individual development we cannot give a mechanical description of the condensation of the inheritance into a germ-cell, nor of the differentiation of the embryo, nor of the regulation phenomena observed when an embryo rights itself after the building materials of its living edifice have been seriously disarranged, nor of the way in which many developing parts seem to conspire toward one result. Similarly as regards organic evolution: we cannot offer a mechanical theory of variability; and the process of selection is much more than mechanical sifting. In short, mechanical formulæ do not fully suffice for answering biological questions. Biology requires categories of its own. (*e*) But when the critic of mechanism advances beyond this, to postulate some further vital agency associated with the organism, operating actively in certain cases, directing the chemico-physical processes so that their results are different from what they would have been apart from its intervention, he has passed to thoroughgoing vitalism. Bergson's "*élan vital*" has much of this character; but the most consistently thought out expression of this doctrine is Driesch's "Entelechy" (*The Science and Philosophy of the Organism*, 2 vols. 1908). Discussions of the problem of vitalism may be conveniently found in Johnstone's *Philosophy of Biology* (1914), and Thomson's *System of Animate Nature* (2 vols. 1920). See also J. S. Haldane (*Organism and Environment*, 1917) in which he discusses the physiology of respiration as a test case, and with suggestiveness for both sides of the controversy.

ZUIDER (or ZUYDER) **ZEE** (*see* 28.1049).—It was after the draining of several landlocked seas and small sea-arms of the province of North Holland had been successfully completed in the early part of the 17th century that, about the middle of the next century, the idea of the shutting off and draining the entire Zuider Zee first began to be discussed. Serious objections to the initial scheme led to various proposals for the draining of parts of that sea, and eventually to a thorough investigation as to the best means of closing and draining it. This investigation, instituted by the Zuider Zee Society in 1886, gave rise to a scheme put forward in 1891, the execution of which, in a modified form, was begun in 1920.

The requisite bill was introduced in 1913 and was passed almost unanimously by both Chambers of the States-General in 1918. There may perhaps be some cause for wonder that a decision of such import should have been made during war-time. The explanation is that it was just the circumstances of those days, with the shortage of food occasioned by them, which brought into prominence the importance of extending the area of arable land. Moreover, people had still fresh in their memories the severe storm of 1916, which, bursting the Zuider Zee dykes, deluged vast districts of the country.

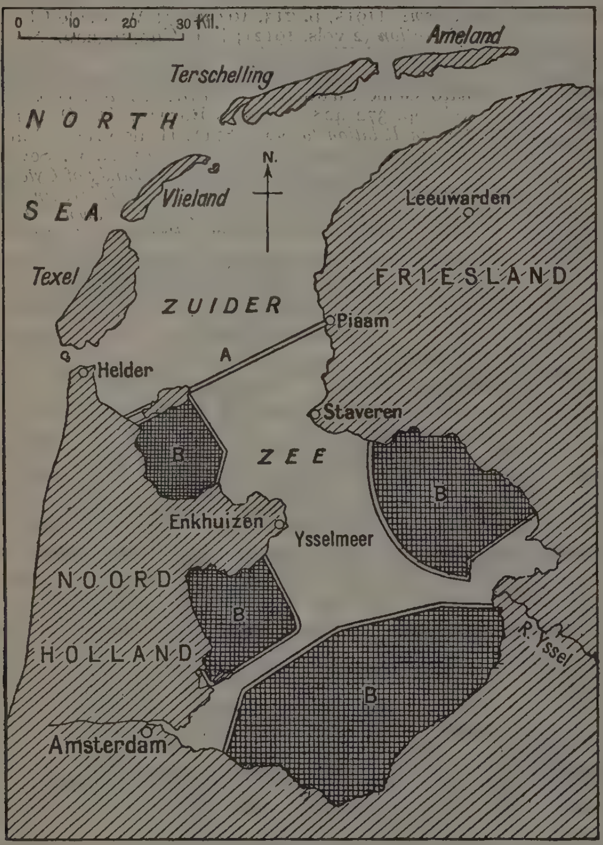

FIG. 1.

The main features of the scheme are indicated in fig. 1. They consist of (*A*) the closure and (*B*) the drainage. The closure is likewise divisible into two parts, namely, from North Holland to the Isle of Wieringen and from that island to Friesland. The combined length of the enclosing dams or barrages is nearly 19 miles. With the completion of the dams 850,000 ac. of the Zuider Zee will be shut off from the North Sea, thus creating a large lake. The dams will afford full protection to the coasts of the provinces bordering on the Zuider Zee for a distance of 152 miles. In the dam sluices will be required to carry off the surplus of water from the enclosed Zuider Zee, and the quantity may at times be very great, since it will include the afflux of the Yssel, an arm of the Rhine. It is therefore deemed necessary to have no fewer than 30 sluices, 33 ft. wide and 13·2 ft. deep. As soon as the closure is complete various parts of the Zuider Zee can be successively dammed and drained. Four inner enclosures (*B*) are contemplated, corresponding to the character of the sea-bottom and other factors.

After deducting the dimensions of dykes, canals, and roads the enclosures will provide 500,000 ac. of land, an area equivalent to that of the cultivated districts of North Holland or of Groningen with a surface analogous in composition to the best clay soil to be found in the country. The remainder of the Zuider Zee bottom consists chiefly of sand, and will, consequently, not be reclaimed. The water covering this area is shown in the sketch under the name of Ysselmeer. Its size is about 580 sq. m., which is thrice that of the lakes of Geneva or of Constance. It will constitute a receptacle for the waters of the Yssel and some smaller rivers, and will discharge them through the sluices into the open sea during ebb tide. As a reservoir of fresh water this Ysselmeer will be able to supply the canals of the surrounding provinces in periods of drought.

The Zuider Zee project has thus a double purpose; in the first place the reclamation from the sea of new fertile provinces; secondly, the security from the encroachments of the sea and the supply of fresh water to the neighbouring provinces. In the initial stages of the work heavy clay was dredged out of the open sea and deposited along the track to be followed by the dam. The cost of the undertaking was calculated in 1914 at about £19,000,000, but it seemed likely in 1921 to be very much more. Ten years were allowed for the construction of the main dam and another 20 years for the completion of the four inner enclosures.

See *Flevo*, monthly periodical devoted to the Zuider Zee reclamation scheme; *Maandberichten betreffende de Zuyderzeewerkens* (monthly). (C. Ly.)

ZULOAGA, IGNACIO (1870–), Spanish painter (*see* 28.1049), had become by 1921 the head of a definite school of Basque and Castilian painters, whose work was marked by a realistic and decorative treatment of contemporary Spanish life, consciously based on Velazquez, El Greco and Goya. His art showed increasing emphasis on silhouette, simplification of form and use of broad masses of sombre colour relieved by splashes of more vivid tints. In his figure compositions a low horizon and a panoramic background were favourite devices for obtaining a decorative monumental effect. Women and the nude figure played an important part in Zuloaga's work. In his portraits, of which typical examples are "Lucienne Bréval in *Carmen*," "Cousin Candida," "The Duke of Alba," and "Countess Mathieu de Noailles," emphasis is on the type rather than the individual, and the combination of realism and simplification tends towards caricature. This also appears in his *genre* paintings of Spanish types, peasants, dancers, bull-fighters, priests and beggars, such as "Old Castile," "The Bottleseller" and "The Witches of San Millan." His landscapes, mainly painted round Burgos, Salamanca and Segovia, have a similar bizarre, fantastic quality. His later work includes "My Uncle Daniel and his Family" (1912), "A Cardinal" (1914), "Toreadors" (1914), "Un Versolari" (1916). An important retrospective exhibition of his work was seen at the 1919 International Exhibition at Bilbao, and he was represented by three portraits in the 1920–1 Exhibition of Spanish Paintings at Burlington House.

INDEX

The Index to the New Volumes XXX., XXXI. and XXXII. of the *Encyclopædia Britannica*, has been prepared on the same system as that used in Volume XXIX. Every Index has its own principles and its own conventions. Those adopted for Volumes I. to XXVIII. need not here be recapitulated; they are sufficiently explained in the preface to Volume XXIX. and in the Rules and Abbreviations which follow it. It is only necessary to add that in this supplementary Index the volume number is not repeated before successive references from the same volume, and that measures have been taken to avoid difficulties arising from variant spellings which have different initial letters, of Arabic and Slavonic names. All abbreviations used in this supplementary Index are explained in the Key beginning on page xv. of Volume XXX.

SUPPLEMENTARY LIST OF CONTRIBUTORS
TO
THE ENCYCLOPÆDIA BRITANNICA

NAMING ONLY THOSE WHOSE INITIALS ARE SIGNED TO THE ARTICLES IN THE NEW VOLUMES, XXX., XXXI. AND XXXII., WITH TITLES OF THE MORE IMPORTANT OF THEIR ARTICLES

For Contributors who wrote only for the 28 earlier volumes see list beginning on page 949 of Volume XXIX.

Further acknowledgment of the collaboration of some of the Contributors named below—and of others, who, while not contributing articles, have by their aid and counsel enriched these new volumes—will be found on pages vii–xiv. of the Preface in Vol. XXX.

The Initials in brackets indicate the Signatures adopted to distinguish the Contributors.

ABBOTT, GRACE, M.A. (G.AB.) Chief of the Children's Bureau, U.S. Department of Labor. Formerly Director, Child Labor Division, U.S. Children's Bureau; and Executive Secretary, Illinois Immigrants Commission, Chicago.
Children, Laws Relating to (United States); Child Welfare (United States); Juvenile Employment (United States).

KAY, J. A. (J.A.K.) Editor of the *Railway Gazette.*
Railways (*British*).

KAYE, H. W., M.D.(Oxon.). (H.W.K.) Director of Medical Services, Ministry of Pensions. Late Personal Assistant to Chief Commissioner of Medical Services, Ministry of National Service.
United Kingdom (*Medical Examination of the Nation*).

KEEBLE, FREDERICK WILLIAM, C.B.E., F.R.S. (F.Ke.*) Sherardian Professor of Botany in the University of Oxford.
Botany (*Introductory*).

KELLOGG, VERNON LYMAN, M.S., LL.D. (V.L.K.) Permanent Secretary, National Research Council, Washington. Sometime Professor in Leland Stanford Jr. University. Director in Brussels of Commission for Relief in Belgium. Member of the American Relief Administration.
Red Cross Work (*United States*); *Y.M.C.A.* (*United States*).

KELSEN, HANS, Dr.Juris. (H.K.) Professor of Constitutional Law at the University of Vienna.
Austria, Republic of (*Constitution and Administration*).

KENT, O. B., B.S., M.S., Ph.D. (O.B.K.) Professor of Poultry Department of New York State College of Agriculture at Cornell University. Managing Editor *Poultry Science.* Secretary-Treasurer of American Association of Instructors and Investigators of Poultry Husbandry.
Poultry (*United States*).

KERSHAW, JOHN BAKER CANNINGTON, F.I.C., F.S.S. (J.B.C.K.) Consulting Chemist and Chemical Engineer. Author of *The Electric Furnace in Iron and Steel Production; Electrometallurgy; Electrothermal Methods of Iron and Steel Production.*
Electrochemistry and Electrometallurgy.

KIRK, EDWARD CAMERON, D.D.S., Sc.D., LL.D. (E.C.K.) Late Dean and Emeritus Professor of Dental Pathology and Therapeutics, Dental School, University of Pennsylvania. Editor of *The Dental Cosmos.*
Dentistry.

KISZLING, LIEUTENANT-COLONEL RUDOLF. (R.K.) Late General Staff, Austro-Hungarian Army. Now of the Kriegsarchiv, Vienna.
Eastern European Front Campaigns (in part); *Luck, Battles of.*

KITCHIN, JOSEPH, F.S.S. (J.K.) Manager in London of the Union Corporation, Limited.
Gold.

KLIMBERG, BARON OTTO VON, Dr.Juris. (O.v.K.)
Bosnia and Herzegovina.

KNECHT, EDMUND, Ph.D.(Zürich), M.Sc.Tech., F.I.C. (E.K.) Associate Professor of Applied Chemistry, Manchester University and College of Technology.
Dyeing (*United Kingdom*).

KRAUSE, DR. ALLEN K. (A.K.K.) Staff of Johns Hopkins Hospital, Baltimore. Managing Editor of the *American Review of Tuberculosis.*
Tuberculosis (*United States*).

KRIEGK, OTTO, Ph.D.(Göttingen). (O.Kr.) Member of the Staff of the *Weser Zeitung*, Berlin Office.
Bremen; Hamburg.

KRISTIANSEN, DR. M. (M.K.)
Denmark (in part).

KUBENA, LIEUTENANT-COLONEL JOHANN. (J.K.*) Austro-Hungarian Engineer Corps. Formerly of the Munitions Department of the Austro-Hungarian War Ministry.
Munitions of War (*Central Powers*, in part).

LAMB, MORRIS CHARLES, F.C.S., F.R.M.S. (M.C.L.) Director of the Light Leather Department of the Leathersellers' Company's Technical College, London. Author of *Leather Dressing, including Dyeing, Staining and Finishing;* etc.
Leather.

LANE, SIR WILLIAM ARBUTHNOT, Bart., C.B., M.S. (W.A.La.) Consulting Surgeon to Guy's Hospital, etc.
Intestinal Stasis.

LAW, EDWARD F. (E.F.L.) Consulting Engineer. Formerly of the Armour Plate Department, Armstrong, Whitworth & Co.
Armour Plate; Helmet.

LAYTON, WALTER THOMAS, M.A., C.H. (W.T.L.) Fellow of Caius College, Cambridge. University Lecturer, Cambridge University. Lecturer, Workers' Educational Association, 1916–9. Member of British Munitions Council during the World War. Temporary Director, Economic and Financial Section, League of Nations. Director, National Federation of Iron and Steel Manufacturers.
